Children's Employment

15 Volumes. Industrial Revolution Subject Set of
The Irish University Press Series of The British Parliamentary Papers

Perhaps the most sordid chapter in the history of labor concerns the abuse inflicted on the very young during the industrial revolution. The cost of industrial progress was reckoned in terms of the most appalling human misery.

Irish University Press has drawn the original, rich, source-material—extensive records of government investigations and studies, the evidence of witnesses, including the witness of the children themselves—into a 15-volume subject set of the British Parliamentary Papers, unquestionably the most valuable and important research tool for students and teachers of the social sciences.

The 15 volumes of documentation cover over one-half century of investigations from the 1816 report of a select parliamentary committee established to investigate the four “radical” proposals of the great social reformer, Robert Owen, to the 1867 reports on the safety provisions, accommodations and sanitary regulations of those trades which still were not regulated by some law.

The history of child labor is documented in over 10,000 pages of text, illustrations, charts, diagrams and tables. The volumes offer a complete analysis of the ages and sex of employed children, hours spent working each day, education, factory inspections, occupational diseases, physical mistreatment, health conditions and hazards, holidays, mortality rates, housing, wages, accidents, food, and sanitary conditions. The industries investigated included mining, textile manufacturing, paper mills, tobacco, iron and metal goods, glass and potteries manufacturers, printing plants, bleaching and dyeing, and the clothing trades.

Children's Employment is one of the 75 subject sets in the Irish University Press 1000-volume Series of the British Parliamentary Papers, making available to student and scholar researchers an almost inexhaustible font of contemporary knowledge of an era when humanitarianism was beginning to mold legislation. *Children's Employment* is available as a subject set or as part of the entire British Parliamentary Papers Series.

A free descriptive 16-page catalog detailing each of the 15 volumes in the *Children's Employment* subject set will be sent to you. Return the coupon or write today to receive your copy.

for Today

*A unified, well-balanced analysis of the problems
and processes of American government in the per-
spective of other contemporary political systems*

AMERICAN DEMOCRACY
in World Perspective
Second Edition

WILLIAM EBENSTEIN · C. HERMAN PRITCHETT
HENRY A. TURNER · DEAN MANN

This new, two-color edition appears at a time when American government is experiencing profound stresses and challenges domestically and abroad. No principle or practice of American government is any longer taken for granted. For this reason, the authors have devoted the first section of their book to a probing analysis of democracy. A new Chapter I, "Conceptions of Democracy," is a comparative study of democracy as a system of power, with particular emphasis on its meaning to Western, Communist, and developing nations. The second chapter, also new, deals with "Conflict Resolution in the Political Process." To illustrate the new challenges of a "conflict perspective," the chapter examines the functions of conflict and its resolution—peaceful or violent—in the American political experience. Finally, the first section considers the challenges to democracy of authoritarianism and totalitarianism at home and abroad. Throughout the book, the American scene is illuminated by appropriate comparisons to other democratic and nondemocratic systems. Basic theory is stressed, with due consideration given to pertinent historical information, institutional operations, and empirical political behavior.

The new edition is strongly oriented toward critical and controversial issues that now dominate American government and politics. There is particularly extensive discussion of political participation, parties, and interest groups, violence and confrontation politics, government and the economy, civil rights, Black Power, pornography and the courts, the changing roles of Congress and the Presidency, and the welfare crisis. In dealing with these highly relevant and often explosive issues the authors express their views, not to lay down certainties but to stimulate thought and classroom discussion.

EXECUTIVE OFFICE

Executive Director, APSA
1527 New Hampshire Ave., N.W.
Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE REVIEW, published quarterly during the months of March, June, September, and December, is supplied to all APSA members. Individual and institutional memberships are \$15.00 a year (\$6.00 for graduate and undergraduate students; five-year limitation). Foreign currency at the official exchange rate will be accepted for foreign subscriptions and foreign membership fees. The equivalent of \$1 for additional postage should be added for foreign subscriptions.

Current issues are priced at \$3.75 per copy; for *back issues* prior to 1963 address Johnson Reprint Corp., 111 5th Ave., New York, N.Y. 10003; subsequent to 1963 send request directly to the American Political Science Association.

Applications for membership, orders for the REVIEW, and remittances should be addressed to the Executive Director, The American Political Science Association, 1527 New Hampshire Ave., N.W., Washington, D.C. 20036. *Notices of change of address* should be received in the Washington office by the 25th day of the month before publication.

Address correspondence about contributions to the REVIEW to Austin Ranney, North Hall, University of Wisconsin, Madison, Wis. 53706. All manuscripts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

Address books intended for review to Richard F. Fenno, 575 Mount Hope Avenue, Rochester, New York 14620; information, including News and Notes, for the Association's newsletter *P. S.*, should be sent to 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036; advertising, reprint and circulation correspondence to the Executive Director at the Washington office.

Articles and notes appearing in the *Review* before the June, 1953 issue were indexed in *The Reader's Guide to Periodical Literature*. *The International Political Science Abstracts* and the *International Index to Periodicals* index current issues. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106. A *Cumulative Index* of the *Review*, Volumes 1-62: 1906-1968, may also be obtained from University Microfilms. Articles appearing in the *Review* are listed regularly in *ABC Pol Sci* and *Current Contents: Behavioral, Social & Management Sciences*.

Office of publication: Curtis Reed Plaza, Menasha, Wisconsin.

Foreign Agent: P. S. King and Staples, Ltd., Great Smith Street, Westminster, London.

Second class postage paid at Menasha, Wisconsin. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized May 12, 1926.

Printed in the United States of America by George Banta Company, Inc., Menasha, Wisconsin.

FOR THE FIRST TIME

THE LEARNING OF POLITICAL BEHAVIOR

By Norman Adler, Teachers College, Columbia University
Charles Harrington, Teachers College, Columbia University

The Learning of Political Behavior is the only book that makes the findings of the rapidly growing field of political socialization available to educators and non-professionals as well as professionals in their original form. The book begins with an excellent introduction by Adler and Harrington explaining the book, its field, and discussing the key concepts of politics and socialization. Next follows literature from the field with articles drawn from a variety of journals and other original sources. The literature in Part Two deals with politics in childhood and features articles by Robert Seigel, David Easton and Robert Hess, Edwin D. Lawson, Dean Jaros, Fred I. Greenstein, and Robert O'Neil to name only a few. In Part Three, which treats the family, school, and peer effects, a representative sampling of distinguished contributors includes James C. Davies, Judith V. Torney, Kenneth P. Langton, and Edgar Litt. A concluding essay by the authors points up future areas of research and discusses educational issues.

The only reader in the field of political socialization, *The Learning of Political Behavior* is a valuable supplement for social studies curriculum courses and political science courses in political socialization, government, and education.

POLITICAL AMBITIONS, VOLUNTEERISM, AND ELECTORAL ACCOUNTABILITY*

KENNETH PREWITT
University of Chicago

A generally accepted interpretation of American politics today is associated with the "theory of electoral accountability." The salient features of this theory are well known. The thesis was initially shaped in Schumpeter's classic work on democracy, and since has been elaborated by a generation of scholars.¹ The elaboration, especially where grounded in empirical studies, has established (1) that the public, being largely apathetic about political matters and in any case ill-informed regarding public issues, cannot provide the necessary and sufficient conditions for the maintenance of democratic procedures; (2) that a liberal political and social elite are committed to the preservation of democratic forms, at least more committed than the average citizen; therefore, (3) what maintains the democratic tradition is not extensive public participation in political policy-making, but, instead, competition among elites whose behavior is regulated by periodic review procedures. Competition among elites and review by citizens of political leaders are provided by elections. Thus elections hold political leaders accountable to non-leaders.²

* The larger project of which this analysis is a part, the City Council Research Project, is sponsored by the Institute of Political Studies, Stanford University, and is supported by the National Science Foundation under grants GS 496 and GS 1898. I am indebted to several colleagues who read and sharply criticized an earlier version of this paper. I leave them unnamed for it is very possible they would prefer not to be associated with even this version.

Key, *Public Opinion and American Democracy* (New York: Knopf, 1961), especially chapter 21; S. M. Lipset, *Political Man* (New York: Doubleday & Co., Inc., 1960, Anchor Books edition, 1963); David Truman, "The American System in Crisis," *Political Science Quarterly*, 73 (December, 1959, pp. 481-97).

³ Important statements are to be found in Peter Bachrach, *The Theory of Democratic Elitism* (Boston: Little, Brown and Co., 1967); and Jack L. Walker, "A Critique of the Elitist Theory of Democracy," this REVIEW, Vol. LX (June, 1966), 285-95. A data article consistent with the thesis is Walter Dean Burnham's "The Changing Shape of the American Political Universe," this REVIEW, 59 (March, 1965), 7-28. A book which anticipates much of this critical literature is T. B. Bottomore's *Elites and Society* (London: Penguin Books, 1964), especially ch. VI.

political participation.⁴ The critics propose that the facts of American politics have been misinterpreted in such a manner as to disguise the extent to which democracy falls short of its promise. Further, in misinterpreting the facts, contemporary political science actually impedes the realization of a more democratic politics.⁵

The critical exchange about the propositions and findings associated with the theory of accountability has given little attention to the third assertion, that elections hold the few who govern accountable to the many who are governed.⁶ This is surprising, for with respect to democratic theory a proposition linking elections and accountability is necessarily a central one. Ours is an inquiry into the conditions under which elections do insure accountability.

I. ELECTIONS, AMBITIONS, ACCOUNTABILITY

A very few leaders govern the very many citizens. Although the many are often politically ignorant and apathetic, the few who govern are nevertheless responsive to the preferences of the many *because*, as elected officials, the few can be and are held accountable for their actions. Accountability is assured because men want to gain and to continue in office and because these men recognize that the voting public determines who will hold office. Therefore, since the electorate through periodic elections grants or withholds the privilege of governing, men who wish

⁴ It has been the substantial accomplishment of Geraint Parry to explicate this point. He writes that although elites may be disagreed on policy, "they may share similar views as to the appropriate decision-making process, namely negotiation between elites." *Political Elites* (London: George Allen and Unwin Ltd., 1969), p. 90. The complete implications of Parry's point cannot be developed at this time. It is evident, though, that elites can simultaneously be committed to democratic norms and to a process of decision-making in which only they participate. It should be remembered that the data base for arguing that political leaders are committed to democracy is primarily survey items on civil liberties and not items on the wisdom of the participation of the "average" citizens in the decision processes.

⁵ I do not mean to imply that the scholars listed in footnotes three and four necessarily associate themselves with this critique of the political science discipline.

⁶ An exception to this is Murray Edelman who has very creatively called into question some of our assumptions about what elections do and do not do. See in particular the first chapter of *The Symbolic Uses of Politics* (Urbana: The University of Illinois Press, 1967).

to govern select policies they believe to be in accord with voter preferences.

This thesis has an honorable tradition. Schumpeter's famous definition of democracy is a useful beginning point: "The democratic method is that institutional arrangement for arriving at political decisions in which individuals acquire the power to decide by means of a competitive struggle for the people's vote."⁷ In his most frequently cited essay on democracy Lipset writes of a "social mechanism which permits the largest possible part of the population to influence major decisions by choosing among contenders for political office."⁸ Or, as more succinctly stated by Downs, contestants for office "formulate policies in order to win elections, rather than win elections in order to formulate policies."⁹ Dahl has been the most influential writer in the Schumpeter tradition. In a theoretical statement about democracy he notes that the effective political elites operate within limits "set by their expectations as to the reactions of the group of politically active citizens who go to the polls."¹⁰ This hypothesis is generally confirmed in his empirical study of New Haven; "elected leaders keep the real or imagined preferences of constituents constantly in mind in deciding what policies to adopt or reject."¹¹

The works of Schumpeter, Lipset, Downs, and Dahl, have been very influential among scholars theorizing about democracy. It has been the accomplishment of these scholars to examine a political process which provides a measure of citizen control over the few who are selected as political leaders. Thus the somewhat banal observation that fewer men issue commands than must obey them is converted into the more powerful theory that elections hold those few accountable for the commands they issue.

The theory of electoral accountability can be reviewed from another, complementary perspective to the one already suggested. Carl Friedrich's "rule of anticipated reactions"¹² provides

⁷ Schumpeter, *op. cit.*, p. 269.

⁸ S. M. Lipset, *op. cit.*, p. 27.

⁹ Anthony Downs, *An Economic Theory of Democracy* (New York: Harper & Row, 1957), p. 28.

¹⁰ Dahl, *Preface*, *op. cit.*, p. 72.

¹¹ Dahl, *Who Governs?*, *op. cit.*, p. 164.

¹² Carl J. Friedrich, *Man and His Government* (New York: McGraw-Hill, 1963), pp. 199-215. Of course Friedrich's "rule" is much broader than what is implied by my use; he develops a theory of political influence based on the rule which refers to nearly all political interactions, not just to relationships between electorates and representatives. A study which applies the "rule of anticipated reaction" and comes to conclusions similar to those

the hint for this other perspective and Schlesinger's "ambition theory of politics"¹³ makes it explicit. Men in office anticipate the likely response of voters because the incumbents want either to retain that office or to move to a more elevated one. This perspective on accountability assumes that there is a supply of men intent on gaining and then holding political office. This assumption links directly to thinking about accountability. For if men are uninterested in gaining and holding office, why should they guide their actions in a manner sensitive to voter preferences?

Schlesinger has stated this point vigorously. "Ambition lies at the heart of politics," writes Schlesinger. He reasons, with particular relevance to democratic theory,

To slight the role of ambition in politics, then, or to treat it as a human failing to be suppressed, is to miss the central function of ambition in political systems. A political system unable to kindle ambitions for office is as much in danger of breaking down as one unable to restrain ambitions. Representative government, above all, depends on a supply of men so driven; *the desire for election and, more important, for reelection becomes the electorate's restraint upon its public officials*. No more irresponsible government is imaginable than one of high-minded men unconcerned for their political futures.¹⁴

We can now reformulate the theory of electoral accountability as we understand it.

Since periodic elections hold officeholders accountable, these officeholders select policies in anticipation of voter response and thus choose policies which broadly reflect the preferences of the governed.

This thesis, in turn, rests upon a prior assumption:

Men in political office work to gain their positions and wish to retain them.

II. SOME PUZZLING RESPONSES

In a study of the men who govern eighty-two cities of the San Francisco Bay Area, more than 400 city councilmen were interviewed with a lengthy and largely open-ended questionnaire. A wide variety of topics were covered, and councilmen were given ample opportunity to state the decision criteria they invoked as they set

advanced here is Roy Gregory, "Local Elections and the 'Rule of Anticipated Reactions,'" *Political Studies*, XVII (March, 1969), 31-47.

¹³ Joseph A. Schlesinger, *Ambition and Politics* (Chicago: Rand McNally & Co. 1966).

¹⁴ *Ibid.*, p. 2, italics added.

about the task of governing their communities. In reading these protocols it becomes evident that often the sentiments voiced by these councilmen do not match well with what the "rule of anticipated reactions" leads us to predict. Indeed, if the reader of the protocols is bearing in mind the observation that elected leaders "formulate policies in order to win elections," then the responses can only be described as puzzling. For it is very clear that councilmen infrequently refer to elections and, when they do, it often is in a manner which directly contradicts the premises of a theory of electoral accountability.

For example, councilmen were asked if they felt it were easy or difficult to go against majority preferences when choosing community policies.

Easy, I am an independent type of individual. I don't feel the weight of voter responsibility. I am not all fired up for a political career.

You don't always follow the majority; you shouldn't give a damn whether you get elected or not. Don't be afraid to be defeated.

Yes, it is easy because I don't really care if I get elected or not.

I am free to do as I feel. In general it is easy to vote against the majority because I don't have any political ambitions.

Responding to a related question, another councilman explains why he and his colleagues ignore the pressures which mount from community influentials:

I doubt if the City Council would consider preferentially the opinion of such a person. This City Council doesn't give a damn if it is reelected.

More of the same is voiced in response to questions about the councilmen's political futures. One respondent, not sure whether he will stand for reelection, makes his position clear.

I won't know until my time is up. I don't think a councilman can do a good job if he is concerned about counting votes. If something is best for the city, you have to go against some groups. And you don't want to have to worry that these groups may not vote for you in the next election if you vote wrong.

Another doubtful candidate,

I promised myself I wouldn't decide ahead of time whether to run or not. I don't want to do things to collect votes:

These quotations, although clearly contradicting the theory of electoral accountability, do not constitute a data base on which to confirm or

falsify anything. For one thing, the quotations were selected to make a point. Moreover, they are responses from one small population of elected officials—nonsalaried, nonpartisan city councilmen from one region of one state. Yet these responses should not be dismissed too readily. The manner in which councilmen reflect on their relationships with the public indicates that the rule of anticipated reactions does not always operate. It is in order to ask whether there are political conditions which, if present, would make these councillor responses less puzzling. This inquiry is best initiated by specifying more exactly a proposition in the theory of electoral accountability.

III. THE SELECTION AND DISPLACEMENT OF POLITICAL LEADERS

A very crude classification permits categorizing theories of democracy as having one of two emphases. One emphasis stresses widespread citizen participation in the making of public policy. Of relevance to scholars in this tradition are issues such as expansion of suffrage, citizenship training, methods of citizen petitioning, rights of association and free speech, mobilization of the public, and so forth. The second emphasis stresses procedures of leadership selection and displacement. Relevant issues are extent of organized competition for office, availability of regularized review procedures, tenure limitations, access of all social groups to political recruitment channels, circulation of elites, and so forth. Though no scholar is faced with an either-or choice, individual scholars as well as schools of thought tend to concentrate on one or the other set of issues.

The theory of electoral accountability largely directs attention to analysis of leadership selection and displacement. Schumpeter takes "the view that the role of the people is to produce a government." He continues, "it should be observed that in making it the primary function of the electorate to produce a government (directly or through an intermediate body) I intended to include in this phrase also the function of evicting it. The one means simply the acceptance of a leader or a group of leaders, the other means simply the withdrawal of this acceptance. . . . electorates normally do not control their political leaders in any way except by refusing to reelect them or the parliamentary majorities that support them."¹⁵ Lipset advances a similar argument: "Democracy, however, implies permanent insecurity for those in governing positions; and the more truly democratic the governing system, the greater the insecurity of the incumbent.

TABLE 1. PROPORTION OF COUNCILS
WITH VARIOUS APPOINTMENT RATES
(N = 81)

Percentage of Councilmen Initially Appointed to Office (N = 81)	Percentage of Cities With Different Appointment Rates
Fewer than ten	19%
10 to 19	16
20 to 29	23
30 to 39	11
40 to 49	10
50 to 74	14
75 to 100	7
	100%

Thus every incumbent of a position of high status within a truly democratic system must of necessity anticipate the loss of his position by the operation of normal political processes."¹⁶ The processes which provide for democracy are sustained competition for political office and regularized procedures for review by electorates of leaders; parties establish the former, and electorates establish the latter of these conditions.

Since the present task is to explain some "puzzling" responses of elected officials, attention should turn to the procedures for selecting and displacing these officials. The study of the city councils reveals four relevant facts, two related to the selection of the legislators and two related to the manner in which they are displaced.

1) *The Frequency of Appointment to Elected Office.* The theory of electoral accountability makes the tacit assumption that persons holding elected office earned them by competing for voter support. This need not be the case; nearly one-fourth (24 per cent) of the city councilmen interviewed had initially reached office by being appointed to fill an unexpired term. Such frequent use of a method of leadership selection which circumvents the election process will undoubtedly affect how the leaders, appointed as well as those who do the appointing, think about the sanctioning power of elections. Table 1 shows the frequency with which the appointment strategy is used among the cities in the study. These data are taken from aggregate election statistics over a ten-year period, five elections for each city. (Data are available for

¹⁵ Schumpeter, *op. cit.*, p. 269, 272.

¹⁶ S. M. Lipset, Martin Trow, and James Coleman, *Union Democracy* (Garden City: Anchor Books, Doubleday & Co., Inc., 1962), p. 241.

81 of the 82 cities in the study.) In seventeen cities half or more councilmen are initially appointed to office. More than four-fifths of the cities have at least one member appointed (councils are never fewer than five members). In cities where appointment is a regularly employed method of selecting some or most leaders, there may occur a nonchalance about elections.

2) *The Electorate as a (Small) Constituency.* It is well known that relatively few citizens express their preferences in local elections. This generalization holds true for the cities we are studying. Averaged over five elections, fewer than one in three of the adult citizens cast a ballot in the councilmanic elections. Although low voter turnout is normal, what is interesting is to consider the interaction between low turnout and the plurality method of counting ballots. The cities being studied are all nonpartisan and use some variant of at-large election procedures. Depending on the number of vacancies, the two or three candidates with the most votes win. Except in a very few cases, there are no run-off elections. Low turnout and plurality elections mean that a very small number of citizens can elect a candidate to office. Table 2 presents illustrative data showing, for five different size cities, the *minimum* number of votes it took to gain a council seat averaged for five elections. For instance, in a city of more than 13,000 residents, on the average as few as 810 voters elected a man to office. Such figures sharply question the validity of thinking that "mass electorates" hold elected officials accountable. For these councilmen, even if serving in relatively sizable cities, there is no "mass electorate"; rather there are the councilman's business associates, his friends at church, his acquaintances

TABLE 2. MINIMUM NUMBER OF VOTES NEEDED TO WIN OFFICE IN DIFFERENT SIZE CITIES

City Population (1964 estimate)	Average Total Vote of Lowest Winner— Five Elections* (1955-65)
71,000	5,298
28,750	1,931
13,450	810
6,675	518
500	64

* To compute the average total vote of the lowest winner, we simply added the votes of lowest winner for five elections and divided by five. Except in special elections, there are never fewer than two winners for any council election.

TABLE 3. PROPORTION OF CITIES WITH VARIOUS INCUMBENT WIN RATIOS (N=81).

in the Rotary Club, and so forth which provide him the electoral support he needs to gain office.

These two observations, one pointing out the frequency of appointments and the other suggesting that the effective electorate for any given officeholder can be very small in local plurality elections, give pause to interpretations of politics which emphasize that selection to office is controlled by large electorates indirectly voicing policy preferences. In the present research site, selection of leaders is less controlled by a voting public than might be necessary for the conditions of electoral accountability to hold. What about the electorates' power to evict the governors?

3) *The Infrequency of Election Defeat.* Implicit in the theory of electoral accountability is the assumption that voters frequently enough remove men from office that election defeat is seen by officeholders as a threat to tenure. It is difficult to know how frequent is "frequent," but the success of incumbents at gaining reelection is commonly taken for granted by students of American politics. Over the ten-year period four out of five incumbent councilmen who stood for reelection were successful. This figure, though high, is even somewhat lower than one reported for members of the House of Representatives. During the years 1924-1956, 90 per cent of the congressmen who sought reelection were returned by the voters.¹⁷ Once in elected office men can feel relatively secure about staying there. Indeed, in 20 of the 82 cities studied, over a ten-year time period not one single incumbent seeking another term failed to be reelected. Table 3 presents pertinent data.

¹⁷ David A. Leuthold, *Electioneering in a Democracy* (New York: John Wiley & Sons, 1968), p. 127.

Two speculations can be derived from this table, both of which run counter to the assumption that elections insure accountability. The frequency with which officeholders are returned to office suggests that they are unlikely to be constantly preoccupied with voter preferences. Moreover, the voting public, which already constitutes a minority of the eligible population, evidently does not see in elections the means by which to force leadership turnover.

4) *The Frequency of Voluntary Retirement from Elected Office.* In the cities we are studying, more men by far depart from elected office voluntarily than because of election defeat. Officeholders simply conclude that the obligations of office exceed the rewards. Among the nearly 500 men who govern the cities of the San Francisco Bay Area, about one-fifth will be planning to retire voluntarily at the end of the present term and another 30 to 50 per cent will be planning to retire after only one more term. It is not the electorate jealously guarding its power to sanction officeholders which establishes tenure limitations. Rather, there are widely shared norms among these councilmen which lead to self-imposed limitations. The single most important reason for voluntary departures is simply "I've been on long enough" or "I have done my duty." As one typical councillor states it:

No, I won't run again. I think this is the end. If I had my way, I'd limit it to two terms anyway. You get a lot of new blood that way. New ideas are needed and new councilmen can provide them. Give the next guy a chance.

Thus it is that norms held by the councilmen themselves often lead to turnover among officeholders, not the behavior of an aroused or impatient electorate. Table 4 presents data.

IV. THE NORM OF VOLUNTEERISM

This brief attention to the manner in which men enter and depart elected office in 82 California cities points uniformly in one direction. The quotations earlier reported, though puzzling when read in terms of electoral accountability perspectives, are not puzzling when read in the context of the cumulative impact of (1) the frequent reliance on appointment as a route to office, (2) the smallness of the electorate which can send and retain a man in office, (3) the overwhelming electoral advantage held by the incumbent, and (4) the high rate of voluntary retirement from office. Men enter and leave office not at the whim of the electorate, but according to self-defined schedules.

To the extent this is so, it is likely that a strong norm of volunteerism is at work in these

TABLE 4. PROPORTION OF CITIES WITH

fewer than 20	3
	100%

city councils. This appears to result directly from the process by which councilmen are recruited into office, the images they hold of council service, and the manner in which they vacate office. They treat council service as a "citizen duty" in much the same manner as they treat service in the Chamber of Commerce, the PTA, the Library Board, and other such community service organizations. As we pointed out elsewhere, the norm of volunteerism "can serve to undermine an already weakened election system. Although the volunteer in office, especially if relatively indifferent to staying there, may be a devoted public servant as he defines the role, he is unlikely to be constantly sensitive to voter preferences. His political thinking has been formed by a series of experiences which minimize for him the importance of mass electoral."¹⁸

Volunteerism and the Theory of Electoral Accountability

It is clear why electoral accountability is weakened to the extent that volunteerism dominates in a political community. Both the choosers and the chosen come to think of movement into and out of political office as being regulated by self-selection and self-elimination patterns rather than electoral challenges. We have shown elsewhere that in communities where elections seldom evict governors, the officeholders tend to act in response only to their own image of what the community needs. The council which does

¹⁸ Kenneth Prewitt, *The Recruitment of Political Leaders: A Study of Citizen-Politicians* (Bobbs-Merrill, in press). This book includes a more detailed analysis of the survey data.

TABLE 5. RELATIONSHIP BETWEEN EXTENT OF VOLUNTEERISM IN LEADERSHIP SELECTION AND SEVEN DEPENDENT VARIABLES RELATED TO THE THEORY OF ACCOUNTABILITY

Attribute of Council	Extent of Volunteerism*		
	Most Present (15)	Mixed (49)	Least Present (17)
a. Council votes with perceived majority public opinion.	35%	49%	53%
b. Council senses demands from the public.	29%	51%	73%
c. Council reflects concern with next election.	29%	45%	60%
d. Council activates constituencies in connection with policy-making.	35%	43%	73%
e. Council views many groups as politically influential.	29%	51%	67%
f. Council facilitates group access.	35%	61%	60%
g. Council performs services for constituents.	29%	41%	67%

* The councils scored as "most volunteerism" are those above the median of all councils with respect to frequency of appointment to the council and rate of voluntary retirement; those scored as "least volunteerism" are those below the median on these two measures; the "mixed" councils are high on one of the measures but low on the other.

not face the threat of election defeat is less likely than a council which does to respond either to attentive publics or to ad hoc issue groups.¹⁹ We can now carry this analysis a step further, by classifying cities with respect to the "norm of volunteerism."²⁰

For present purposes, two indicators of volunteerism are used: the frequency of appointment as a route to elective office and the frequency of voluntary departure from office. Cities were ranked high to low on each of these measures; they were then divided at the median and cities above the median on both measures are said to be the most characterized by the norm of volunteerism. Cities below the median on both measures are least characterized by this norm. Cities high on one measure but low on the other are for present purposes simply left as intermediate. Two indicators, then, are combined to construct an ordinal measure of volunteerism.

The hypothesis is very simple: councils characterized by volunteerism will exhibit traits which contradict what the theory of electoral accountability predicts about elected legislatures. Table 5 confirms this hypothesis. Where the norm of volunteerism is more prevalent, councils are (a) more likely to vote against

what they see as majority opinion, (b) less likely to feel under pressure from the public, (c) less likely to consider the upcoming election when choosing among policy alternatives, (d) less likely to involve constituencies as part of the strategy of policy-making, (e) less likely to view political groups as having an influential part to play in city politics, and (f) less likely to facilitate group access to the council, and (g) less likely to perform services for constituents.²¹

Each item in Table 5 merits discussion, for each one relates in its own manner to a theory of electoral accountability. For instance, if the anticipated reactions of the voting public are thought to be relevant to policies chosen by governors, then elected councils will likely involve constituencies as the council carries out its deliberations. Yet it is clear that councils characterized by volunteerism seldom mobilize constituencies as part of the activities which surround the making of policy. Or, another example, elected councils will feel under some pressure from publics if indeed the councils are

²¹ In every case the dependent items in Table 5 derive from some method of aggregating the responses of individual councilmen into a group measure. Two procedures are represented. With respect to all items but 'c' and 'd' the responses of individual councilmen were summed, a mean was computed, and the distribution of means was then used to assign councils as either above or below the median of all councils. With respect to the remaining items, a procedure relying on coder judgment to assign a score to each council was used. Footnote 9 in Prewitt and Eulau, *ibid.*, describes the procedure.

¹⁹ Kenneth Prewitt and Heinz Eulau, "Political Matrix and Political Representation," this REVIEW, LXIII (June, 1969), pp. 427-441.

²⁰ In this analysis the council in contrast to the individual councilman is taken as the unit of analysis. The theoretical rationale for this as well as some methodological considerations are spelled out in Prewitt and Eulau, *ibid.*

keeping the preferences of constituents in mind as they govern their cities. But we note that fewer than one-third of the more volunteeristic councils report being under such pressure. And so forth.

It would detract from the central argument to pursue every theoretical lead suggested by Table 5. Instead, a general summary observation can be advanced. The theory of accountability is both confirmed and confounded by the evidence of Table 5. On the one hand, councils in cities where elections play a greater role in the selection and eviction of governors appear to be more sensitive to public constituencies. On the other hand, there are processes at work, summarized by the term volunteerism, which weaken the capacity of elections to insure the accountability of the elected legislature to the voters.

This summary inference from Table 5 suggests, in turn, several ways in which to speculate about volunteerism, elections, and democratic accountability. First, however, it is important to raise the nagging question: How unusual are the Bay Area councils with respect to the norm of volunteerism?

Scattered Evidence About the Distribution of Volunteerism in American Politics

Although the measures used in this study forced some variation among the cities, it is plausible that if all political units in the U.S. could be arrayed along a continuum from the most to the least volunteeristic, the 82 units here studied would cluster well toward the "most volunteeristic" end. Systematic data for determining the accuracy of this guess are not readily available; however, there is sufficient evidence to confirm that volunteerism is far from being limited to a few Bay Area nonpartisan councils.

It has been noted already that the frequency with which incumbents are returned to office when they seek reelection is uniformly high for all types of legislatures in the United States. The rate of voter turnout is a more problematic variable because of the ambiguity of determining what is "high" and what is "low" turnout; however, both survey and aggregate data readily confirm that voter turnout fluctuates widely from one type of election to the next and, in the thousands upon thousands of elections below the state level, elections very often involve only small minorities of the eligible electorate. Data on appointment as a route to elective office are not available, but a reasonable guess is that the figure reported here (approximately one-fourth) does not greatly exaggerate the proportion of appointees to school boards, city and township

councils, and so forth. The proportion of appointees to state legislatures and to the national congress should be much lower.

There are more systematic data on the frequency with which elected officials voluntarily depart from office, the remaining indicator of volunteerism. James Young's *The Washington Community—1800–1828*, is a good beginning point. Evidence reported by Young indicate that the federal congresses of the early decades should be placed well toward the "most volunteerism" end of a hypothetical continuum; indeed, the legislative body empowered to guide the nation in its early years had higher rates of voluntary departure than the councils presently governing the Bay Area cities. "From 1797 to 1829 (5th through 20th Congresses) more Senators resigned than failed to be reelected by their state legislatures." And, "Each new Congress, moreover, brought a host of new faces to the community, drastically reconstituting its membership every two years. For the first four decades of national government between one-third and two-thirds of the congressional community left every two years not to return."²² On the average, the biennial turnover during the first decades of the founding was 41.5 per cent of the total legislative membership. Young's study is a prototype for investigating how voluntary turnover affects the governing process and especially the means by which accountability is insured. The burden of his analysis is that the legislators were "remote" from the citizens they were to govern and, in effect, that they were not held accountable for the policies they pursued.²³

To move to more recent times, and from the national to the state level, it is instructive to review the data on voluntary retirement collected by Charles Hyneman three decades ago. He reports that much turnover among state legislators is due not to election defeat, but to voluntary retirement. In his extensive study of twenty-five state chambers between 1925 and 1935, he found that fewer than one-third of the retire-

²²James S. Young, *The Washington Community—1800–1828* (New York: Columbia University Press, 1966), p. 57, 89.

²³Young writes of the "remoteness of the rulers from the citizenry and remoteness of the citizenry from the rulers" and that the "isolated circumstances of the early governing group must have afforded a freedom of choice as nearly uninhibited as any representative government could have." *Ibid.*, p. 34, 36. Young, of course, is making much of the sheer fact of geographical isolation whereas volunteerism implies a distance between rulers and citizenry established not by geography but by the processes of leadership selection.

ments from state legislative office were due to election defeats; only 16 per cent came from general election defeats, the presumed sanction of the voting public. After his exhaustive study of turnover he commented, "The real task is to find why so many legislators, senators and representatives alike, choose not to run again."²⁴ Eulau, writing about state legislators some twenty years after the Hyneman study, reports similar figures. The proportion of legislators in each of four states who either intend not to stand for reelection or are doubtful about it is as follows: Tennessee—66 per cent; Ohio—40 per cent; California—34 per cent; and New Jersey—24 per cent.²⁵ Barber's study of Connecticut state legislators provides similar data. In Connecticut, "election defeat accounted for less than 26 per cent of retirement from the House in seven elections between 1946 and 1958. Thus, by far the largest proportion of retirements may be classified as pre-election turnover."²⁶ Among the first-term representatives interviewed by Barber, 35 per cent report that they definitely or probably would not be willing to serve more than two or three terms.

Additional confirmation that leadership turnover is often voluntary is to be found in data collected by Schlesinger. For twenty-nine states between 1914 and 1958, in only 17 per cent of 542 gubernatorial elections was the incumbent defeated. For thirty-six states during the same time period, in only one-fifth of the 616 senatorial elections was the incumbent defeated.²⁷ Although it is not possible to derive rates of voluntary retirement directly from these figures, Schlesinger presents other data which support the conclusion that rates of voluntary retirement are high even for governors and senators.²⁸

²⁴ Charles S. Hyneman, "Tenure and Turnover of Legislative Personnel," *Annals of the American Academy of Political and Social Science*, Vol. 195 (1938), p. 20.

²⁵ John Wahlke, Heinz Eulau, William Buchanan, Leroy C. Ferguson, *The Legislative System* (New York: John Wiley & Sons, 1962), computed from Table 6.1, p. 122.

²⁶ David Barber, *The Lawmakers* (New Haven: Yale University Press, 1965), p. 8.

²⁷ Schlesinger, *op. cit.*, p. 63 (Table IV-2).

²⁸ This inference seems warranted on the basis of evidence Schlesinger presents on p. 144, regarding the frequency with which the candidates for gubernatorial and senatorial elections differ from their predecessors, and his statement on p. 146 that the opportunity for men to be nominated for these offices is "impressively high, indicative of a great deal of fluctuation at the very top of the

This sketchy review suggests an hypothesis: there is an inverse relationship between volunteerism and perceived political stakes. "Important" legislatures have less volunteerism than "unimportant" ones. There are several variants on this theme. For instance, the higher the level of government, the fewer the number of voluntary departures from office. Another variant, the more professionalized (or better paid) the legislature, the lower the rate of volunteerism.²⁹ Further, the greater the competition to enter the legislature, the less volunteerism there is. And so on. Thus, whereas in the extent of volunteerism the national congresses of the 1800's may parallel nonpartisan city councils in the 1960's, the 80th Congress in no way resembles the 8th Congress.

Such qualifications, though important, do not negate the thesis developed in this paper. The thesis is theoretical—showing the relationship among variables pertinent to accountability theories, but also descriptive—discovering something about the likely distribution of these variables.

pyramid within state parties." His data, of course, include controls for tenure limitations. There are two interpretations possible. Either the political parties habitually fail to renominate the incumbent, or the rates of voluntary retirement are high for governors and senators. The latter seems the more reasonable inference.

²⁹ Schlesinger writes that the "impact of ambitions upon the behavior of public officials will be greater on those in high than in low office, greater upon congressmen than upon state legislators, greater upon United States Senators than upon United States Representatives." *Ibid.*, p. 193. Although this observation is intuitively persuasive, it is relevant to record that it is an inference and in no way is it directly confirmed by the massive amounts of evidence Schlesinger imaginatively analyzes. Evidence suggesting that salary differentials may promote or retard political ambitions at the state level is suggested by John W. Soule, "Future Political Ambitions and the Behavior of Incumbent State Legislators," *Midwest Political Science Review*, XIII (August, 1969), pp. 443-444. For a study indicating that as a legislature becomes more professionalized over time, the incidence of volunteerism should drop, see Nelson Polsby, "The Institutionalization of the U. S. House of Representatives," this *REVIEW*, LXII (March, 1968), 144-168. To read Polsby's study side-by-side with Young's analysis of the early congresses is very instructive, and indicates why volunteerism as an attribute of a legislature is variable over time.

To review the thesis: the theory of electoral accountability predicts that elected officials keep in mind the preferences of ordinary citizens because these officials are determined to remain in office. This proposition has been confirmed in several empirical studies, and, in fact, is confirmed in Table 5. What is generally ignored by scholars associated with the accountability theory is (1) clearly establishing the conditions under which elections hold the representatives accountable, and (2) providing evidence regarding the distribution of these conditions. Our analysis speaks to both of these points: where the methods of selecting and displacing political leaders encourage the norm of volunteerism, electoral accountability is weakened; moreover, though undoubtedly more prevalent at the local than the state and at the state than the national level, the norm of volunteerism in some degree is present in most legislatures.

A postscript to this latter point is in order. The overwhelming majority of the half-million elected legislators in the United States serve in legislatures where some recognizable degree of volunteerism is present. The skeptic can say that these legislative bodies—city councils, school boards, village governments, etc.—are “unimportant” because they deal with “low-stake issues.” While true that the House Committee on Education and Labor is far more important to the education of American citizens than any single school board, the cumulative impact of nearly 35,000 school boards is in turn far greater than the action of a Congressional Committee. Thus, whereas there is one national legislature and 50 state legislatures (where already evidence of volunteerism is apparent), there are in excess of 3,000 county governments, in excess of 35,000 municipalities, towns, and townships, nearly 35,000 school boards, as well as 18,000 special districts.

I do not deny the symbolic as well as material importance of the central government, yet if the ordinary citizen is subject at the local level to legislatures seemingly remote and indifferent, that citizen's “experience with democracy” falls short not only of the classical model but also of the neo-classical model which emphasizes electoral accountability. It is in this context that we should interpret survey results such as, for instance, McClosky's finding that approximately half of the general electorate “perceive government and politicians as remote, inaccessible, and largely unresponsive to the electorate's needs or opinions.”³⁰ Volunteerism among elected officials

may well be connected with political disillusionment among the electors.

V. SPECULATIONS AND CONCLUSIONS

Perhaps the most efficient manner in which to summarize the thesis and findings presented here is to organize the conclusions around a few general speculations. Speculations permit us to review prominent themes in writings about electoral accountability, from the viewpoint of findings about volunteerism, and yet avoid the dangers of premature precision.

Leadership Turnover, Accountability, and Volunteerism. To consider democratic politics from the perspective of electoral accountability theories has, for many writers, implied sharing with Lipset the belief that permanent insecurity for those in governing positions makes for democratic politics. When leaders are entrenched they form an oligarchy; and oligarchies are inimical to political processes which would insure some fit between the preferences of non-leaders and the policies of leaders. Insecure tenure, in contrast, assures that leaders will attempt to retain their high status positions by satisfying the policy demands of at least some sizable part of the citizenry.

This formulation seems reasonable until we encounter volunteerism in the methods of leadership selection. When movement into and out of office is self-determined, rapid turnover of elected leaders, far from being an indicator of insecurity and, hence accountability, is more likely related to an indifference among the elected to the sanctions of the ballot box. Indeed, when we discovered in the city council study that leadership turnover was not necessarily linked to election defeats, we were led to distinguish between the “circulation of elites” and the “replaceability of elites.” The former term implies that leadership turnover is associated with changes in the mood of the citizens and thus with changes in policies; the latter term makes no such assumptions. Where there is recruitment by replaceability, a procession of like-minded men move through public office with relatively little resultant shift in policies.

Civic Duty, Social Status, and Malrepresentation of Social Groups. The inquiry into volunteerism also encourages some revised thinking

³⁰ Herbert McClosky, “Consensus and Ideology in American Politics,” this REVIEW, LVIII, (June, 1964), 361-382. For instance, as reported on pp.

370-371, more than half the general electorate agree that “It seems to me that whoever you vote for, things go on pretty much the same” and “There is practically no connection between what a politician says and what he will do once he gets elected,” and “Nothing I ever do seems to have any effect upon what happens in politics.”

about a topic closely related to the issue of tenure insecurity. There is in the study of democratic politics considerable attention to the topic of social class and political recruitment. One perspective on this question treats the political processes which accentuate and those which depress the tendency for the members of the relatively better-off social groups in society to be significantly overrepresented in political leadership circles.

Where electoral accountability is fully operating, this tendency should be depressed. Candidates for office must appeal to a relatively wide range of social groups in order to reach and to hold political office. Where volunteerism affects leadership selection, class bias in the composition of the legislature is likely to be accentuated. The reasoning here is simple.

First, the smallness of the voting constituency increases the probability that the constituency is socially homogeneous, and, based on what we know about the correlates of voting behavior, consequently increases the probability that the constituency is middle and upper-middle class.³¹ Second, a more complicated but possibly more critical factor relates to the motives for seeking office. When the selection of leaders is characterized by volunteerism, the recruitment processes necessarily further careers of the self-selected. For the cities we study this implies that the pool of eligible recruits for city office are those citizens with a strong sense of civic duty. That the positions are nonsalaried adds to this tendency. Although the term "civic duty" can imply many things, among the citizens who govern cities and towns, school boards and special districts, and so forth, it very often implies a belief that one has the duty to direct the political community.³² This belief is never randomly distributed across all socio-economic groupings in society. Political socialization stud-

ies show that white middle and upper-middle class children, more so than children from less well-to-do social groups, are taught to believe in their "duties" as citizens and their "responsibilities" as community leaders. Civic duty tends to be little more than a middle-class version of *noblesse oblige*; it is not nobility status which obligates but bourgeois status. Political volunteerism derives from citizen duty, and malrepresentation of social groups in legislatures is one consequence.

Status Inequality, Ambitions, and Volunteerism. The investigation of volunteerism might make a contribution to a related inquiry which attempts to link accountability to issues of social status. Lipset, elaborating on Michels, notes that democratic accountability is threatened when the status difference between political leaders and political followers grows too great.³³ If there is great status inequality, those in office will have cause to resist leadership turnover and, moreover, will have the superior resources it requires to forestall challenges from an opposition. The difficulties of establishing constitutional democracy in several African nations lends support to this hypothesis.

A contrary position has been advanced by May³⁴ and, indirectly, by Schlesinger. When political office confers no status, then the motive for seeking office is not political ambition but, for instance, civic duty. Schlesinger reminds us that the absence of ambition in politics can be inimical to representative democracy: "No more irresponsible government is imaginable than one of high-minded men unconcerned for their political futures."³⁵ The earlier cited responses of elected councilmen lends support to this point; as one councilman stated it, "I am free to do as I feel. In general it is easy to vote against the majority because I don't have any political ambitions."

The data on volunteerism helps clear up the contradiction between the "status inequality" hypothesis and the "ambition" hypothesis. The question is not whether political leaders have higher status for, as Eulau reminds us, this is almost certainly the case.³⁶ At issue is not the status distance, but whether office confers status

³¹ An interesting study which shows that the socio-economic composition of legislatures is related to voter turnout is that of Rosalio Wences, "Electoral Participation and the Occupational Composition of Cabinets and Parliaments," *American Journal of Sociology*, vol. 75 (September, 1969), pp. 181-192. A related discussion is in Kenneth Prewitt, "From the Many Are Selected the Few," *American Behavioral Scientists*, November, 1969.

³² A finding of McClosky's is instructive in this context. One of the very few items on which political influentials measured higher than the general electorate was as follows: "Most politicians can be trusted to do what they think is best for the country." Seventy-seven percent of the influentials agreed and fifty-nine percent of the electorate did. *op. cit.*, p. 370.

³³ Lipset, et al., *op. cit.*, especially pp. 239-247.

³⁴ A paper by John D. May, unfortunately not yet published, is particularly insightful on this issue. See his "Democracy and Inequality," unpublished paper, Chicago, 1969.

³⁵ Schlesinger, *op. cit.*, p. 2.

³⁶ Heinz Eulau, "Changing Views of Representation," in Ithiel de Sola Pool (ed) *Contemporary Political Science* (New York: McGraw-Hill, Inc., 1967), p. 80.

or whether office is simply a by-product of previously achieved status, which is to say previously acquired prestige, wealth, leisure, security, and so forth. Where political office is but a by-product, the conditions leading to volunteerism will be accentuated. Electoral accountability can be expected to suffer.

Volunteerism and the Political Formula. Inquiry into political representation, following Burke's lead, has established that representatives define their relationship with constituencies according to a trustee role-orientation, a delegate role-orientation, or, possibly, some mixture.³⁷ Available evidence testifies to the widespread presence of the trustee orientation among legislators in the United States; and though theories of electoral accountability have never been joined with studies of representational role-orientations, it is a reasonable speculation that trusteeship and volunteerism can comfortably coexist in the same legislative system.³⁸ Moreover, volunteerism and trusteeship are congenial to an interpretation of elections which stresses the ceremonial and ritualistic function they perform.

To suggest that volunteerism in political recruitment, trusteeship in political representation, and ritualism in political elections form a compatible package does not mean that these political phenomena necessarily coexist. But that they might coexist suggests an entirely new perspective on the theory of electoral accountability. Mosca will help us to sharpen this perspective.

For Mosca, the power of any political class rests upon a political formula or the set of moral principles which justifies the political hierarchy to those toward its bottom as well as those toward its top. Mosca describes the political formula in the United States: "The powers of all lawmakers, magistrates and governmental officials in the United States emanate directly or indirectly from the vote of the voters, which is held to be the expression of the sovereign will of

the whole American people."³⁹ That Mosca himself considered this belief to be myth does not make it so. That he was correct in asserting that the vast majority of Americans believe in the formula, however, cannot be denied. One need only consult a portion of the data stored in political socialization studies, survey data, civics textbooks, political histories, journalistic imagery, and campaign speeches to conclude, with Mosca, that political leaders in this society are granted legitimacy because they are elected.

It has been the accomplishment of theorists working with electoral accountability notions to effect a subtle translation of Mosca's observation. Mosca's insight into the process which *legitimizes* political leaders has been converted into a statement about the process which holds them *accountable*. But this is to confuse what should be separate issues. The electors and the elected can share a belief in the legitimacy of the political hierarchy because votes are cast and counted, without that same counting of ballots necessarily leading to accountability.

The operative political formula as described by Mosca is considered to be congenial to electoral accountability; less often noted is that the political formula is equally congenial to a politics where accountability does not proceed from electoral sanctions. Volunteerism in political recruitment, trusteeship in political representation, and ritualism in elections provide appropriate conditions. Political leaders are legitimated without feeling accountable. This would be so if, first, the norms shared by political leaders stress mutual responsibility for the public interest (trusteeship) without at the same time stressing accountability; such norms bring leaders closer together while simultaneously widening the distance between any given set of leaders and the constituency it represents.⁴⁰ And if, second, the political norms widely shared by citizens are such as to temper direct and regular involvement in political activities; that such is the case in the United States is the burden of much survey data.⁴¹

³⁷ Wahlke, Eulau, *et al.*, *op. cit.*, is the most elaborate application of the Burkean categories to the empirical study of legislators.

³⁸ A measure of a council attribute related to trusteeship is something we term the "city father ethos," a term which describes an orientation of paternalistic responsibility among the councilmen. Where volunteerism was most present, 65% of the councils are characterized by this orientation; where volunteerism is least present, 40% of the councils are characterized by the orientation. A great deal of additional analysis remains to be completed, however, before we can confirm that volunteerism and trusteeship are empirically linked.

³⁹ Gaetano Mosca, *The Ruling Class* (New York: McGraw-Hill, Inc., 1939), p. 70.

⁴⁰ I have paraphrased the argument advanced in Parry, *op. cit.*, in this sentence. It has been the substantial and brilliant contribution of Theodore Lowi, in his *The End of Liberalism* (New York: W. W. Norton & Co., Inc., 1969), to document exactly this tendency in contemporary politics. See, for instance, chapter 3, where he relates his thesis to the problem of holding leaders accountable for their actions.

⁴¹ Gabriel Almond and Sidney Verba, *The Civic Culture* (Princeton: Princeton University Press,

Two points remain to be made. First, the speculation advanced in these last few paragraphs refers to electoral accountability and not to whether leaders consult the preferences of non-leaders. The question of consultation is separate from the issue of accountability. The point we stress is that if the consultative process occurs to any significant extent where volunteerism is present, it is for reasons other than an accountability forced by electoral sanctions.

Second, the last few decades of empirical re-

1963), especially pp. 476-487. The authors actually refer to their finding as constituting a myth. The citizen's perception that he can be influential "may be in part a myth, for it involves a set of norms of participation and perceptions of ability to influence that are not quite matched by actual political behavior," p. 481.

search have seen an emphasis on electoral accountability as the process which links the few who govern and the many who are governed. The study of politics has been advanced by this insight. But if the theory of electoral accountability has added to an understanding of democratic politics, it has also distracted attention from political processes which weaken electoral sanctions. Volunteerism is one of these processes. Volunteerism as well as other political processes which weaken electoral sanctions are undoubtedly present in the strikingly large number of legislative systems in the United States. There are very many small groups of citizens elected to make laws for the greater number of citizens. It is a research task of practical as well as theoretical significance to discover what, if anything, establishes democratic controls over legislatures somewhat immune from electoral sanctions.

PRESIDENTIAL POPULARITY FROM TRUMAN TO JOHNSON¹

JOHN E. MUELLER

University of Rochester

I think [my grandchildren] will be proud of two things. What I did for the Negro and seeing it through in Vietnam for all of Asia. The Negro cost me 15 points in the polls and Vietnam cost me 20.

Lyndon B. Johnson²

With tenacious regularity over the last two and a half decades the Gallup Poll has posed to its cross-section samples of the American public the following query, "Do you approve or disapprove of the way (the incumbent) is handling his job as President?" The responses to this curious question form an index known as "Presidential popularity." According to Richard Neustadt, the index is "widely taken to approximate reality" in Washington and reports about its behavior are "very widely read"³ there, including, the quotation above would suggest, the highest circles.

Plotted over time, the index forms probably the longest continuous trend line in polling history. This study seeks to analyze the behavior of this line for the period from the beginning of the Truman administration in 1945 to the end of the Johnson administration in January 1969 during which time the popularity question was asked some 300 times.⁴

¹This investigation was supported by a grant from the National Science Foundation. At various stages helpful comments, criticisms, and complaints were lodged by Richard Fenno, Gerald Kramer, Richard Niemi, Peter Ordeshook, Alvin Rabushka, William Riker, and Andrew Scott.

²Quoted, David Wise, "The Twilight of a President," *New York Times Magazine*, November 3, 1968, p. 131.

³Richard E. Neustadt, *Presidential Power: The Politics of Leadership* (New York: Wiley, 1960), p. 205n.

⁴A general picture of what this line looks like can be gained from the figure in Robert A. Dahl, *Pluralist Democracy in the United States* (Chicago: Rand McNally, 1967), p. 107. The Presidential popularity data for the Johnson administration have been taken from the *Gallup Opinion Index*. All other poll data, unless otherwise indicated, have come from the archives of the Roper Public Opinion Research Center at Williams College, Williamstown, Massachusetts.

Four variables are used as predictors of a President's popularity. These include a measure of the length of time the incumbent has been in office as well as variables which attempt to estimate the influence on his rating of major international events, economic slump and war. To assess the independent impact of each of these variables as they interact in association with Presidential popularity, multiple regression analysis is used as the basic analytic technique.

I. THE DEPENDENT VARIABLE: PRESIDENTIAL POPULARITY

The Presidential popularity question taps a general impression about the way the incumbent seems to be handling his job at the present moment. As Neustadt notes, the response, like the question, is "unfocused,"⁵ unrelated to specific issues or electoral outcomes. The respondent is asked to "approve" or "disapprove" and if he has "no opinion," he must volunteer that response himself. He has infrequently been asked *why* he feels that way—and many respondents when asked are able only vaguely to rationalize their position.⁶ And only at times has he been asked to register how strongly he approves or disapproves.

A disapproving response might be considered a non-constructive vote of no-confidence: the respondent registers his discontent, but he does not need to state who he would prefer in the Presidency. Thus the index is likely to be a very imperfect indicator of success or failure for a President seeking re-election. While approvers are doubtless more likely than disapprovers to endorse his re-election, on considering the opposition some approvers may be attracted into voting against the incumbent just as some disapprovers may be led grudgingly to vote for him.⁷

⁵*Op. cit.*, p. 96.

⁶See for example the breakdowns in *Gallup Opinion Index*, March, 1966, p. 4.

⁷There is also a more technical reason why the popularity index has little direct relevance to the electoral result: Gallup does not ask the question during a President's re-election campaign. Thus for the months between early summer and late fall in 1948, 1956, and 1964 no Gallup data on Presidential popularity exist. One other technical-

Whatever peculiarities there are in the question itself, they are at least constant. Unlike many questions asked by the polling organizations, wording has not varied from time to time by whim or fashion. The stimulus has therefore been essentially fixed; only the response has varied.

And the variation has been considerable. Harry Truman was our most popular President in this period—for a few weeks in 1945 when more than 85 percent of the public expressed approval—and our least popular—from early 1951 until March 1952 when less than 30 percent were usually found to be favorably inclined. Other Presidents have stayed within these limits with Lyndon Johnson most nearly approaching the Truman extremes. President Eisenhower's popularity was never higher than 79 percent, but it never dropped below 49 percent either. President Kennedy also maintained a rather high level of popularity but was in noticeable decline at the time of his death.

The proportion of respondents selecting the "no opinion" option, averaging 14 percent, remained strikingly constant throughout the period.⁸ This is a little surprising since it might be expected that when opinion changes, say, from approval to disapproval of a President, the move would be seen first in a decrease in the support figure with an increase in the no opinion percentage, followed in a later survey by an increase in the disapproval column with a decrease in the no opinion portion. There are a few occasions in which the no opinion percentage seems to rise and fall in this manner, one occurring in the early weeks of the Korean War, but by and large it would appear that if movements into the no opinion column do occur they are compensated for by movements out of it.

This means therefore that the trend in approval is largely a mirror image of the trend in

disapproval; the correlation between the two is —.98. And, most conveniently, this almost means that the President's popularity at a given moment can be rendered by a single number: the percentage approving his handling of the job. The no opinion percentage is almost always close to 14 percent and the percentage disapproving is, of course, the remainder.

There is, however, one small wrinkle. The no opinion percentage does get a bit out of hand, quite understandably, in the early weeks of the Kennedy and Eisenhower administrations as substantial numbers of respondents felt inclined to withhold judgment on these new men. This inordinate withholding of opinion declined in the first weeks to more "normal" levels with the result that *both* the level of approval *and* disapproval tended to increase.⁹

Since one of the propositions to be tested in this study proposes that there exists a general downward trend in each President's popularity, this initial rating situation causes something of a problem. If the disapproval score is used as the dependent variable there will be a slight bias in favor of the proposition. It seems preferable to load things against the proposition; hence for the purposes of this study *the dependent variable is the percentage approving the way the incumbent is handling his job as President*.¹⁰ The average approval rating for the entire twenty-four year period is 58 percent.

II. THE INDEPENDENT VARIABLES

If one stares at Presidential popularity trend lines long enough, one soon comes to imagine one is seeing things. If the things imagined seem also to be mentioned in the literature about the way Presidential popularity should or does behave, one begins to take the visions seriously and to move to test them.

⁸In the case of President Eisenhower, the no opinion response actually rose a bit before it began to descend, reaching the highest level recorded for any President in the period in March 1953 when 28 percent had no opinion. (President Nixon has proved to be the greatest mystery of all: fully 36 percent registered no opinion after his inauguration.)

⁹It is argued by some that percentages should not be used in their pure state as variables, but rather should be transformed into logits: $Y^* = \log_e [Y/(1-Y)]$. The transformation was tried in the analysis, but it made little difference. Therefore the more easily communicated percentage version has been kept. In any event the dependent variable rarely takes extreme values. It rises to 80 percent only three or four times and never dips below 23 percent.

ity is worth mention. There is a slight underrepresentation of data points in Truman's first years. By 1950, except for the election year phenomenon, the Gallup organization was asking the question on virtually every survey conducted—some dozen or sixteen per year. Before that time the question was posed on the average only about half as frequently. Neither of these technical problems, however, is likely to bias the results in any important way, especially since so much of the analysis allows each administration a fair amount of distinctiveness.

¹⁰The standard deviation for the no opinion response is 2.93. By contrast the comparable statistic is 14.8 for the approve response and 14.5 for the disapprove response.

In this manner were formulated four basic "independent" variables, predictor variables of Presidential popularity. They are: 1) a "coalition of minorities" variable that suggests the overall trend in a President's popularity will be downward; 2) a "rally round the flag" variable which anticipates that international crises and similar phenomena will give a President a short-term boost in popularity; 3) an "economic slump" variable associating recessions with decreased popularity; and 4) a "war" variable predicting a decrease in popularity under the conditions of the Korean and Vietnam wars.

1. *The "coalition of minorities" variable.* In a somewhat different context Anthony Downs has suggested the possibility that an administration, even if it always acts with majority support on each issue, can gradually alienate enough minorities to be defeated. This could occur when the minority on each issue feels so intensely about its loss that it is unable to be placated by administration support on other policies it favors. A clever opposition, under appropriate circumstances, could therefore forge a coalition of these intense minorities until it had enough votes to overthrow the incumbent.¹¹

Transposed to Presidential popularity, this concept might inspire the expectation that a President's popularity would show a general downward trend as he is forced on a variety of issues to act and thus create intense, unforgiving opponents of former supporters. It is quite easy to point to cases where this may have occurred. President Kennedy's rather dramatic efforts to force back a steel price rise in 1962, while supported by most Americans, tended to alienate many in the business community.¹² Administration enforcement of the Supreme Court's school desegregation order tended to create intense opposition among white Southerners even if the Presidential moves had passive majority support in most of the country.¹³

Realistically, the concept can be extended somewhat. From time to time there arise exquisite dilemmas in which the President must act and in which he will tend to alienate *both* sides no matter what he does, a phenomenon related to what Aaron Wildavsky has called a "minus sum" game.¹⁴ President Truman's seizure of the

steel mills in 1952 made neither labor nor management (nor the Supreme Court, for that matter) happy. For the mayor of New York, situations like this seem to arise weekly.

There are other, only vaguely related, reasons to expect an overall decline in popularity. One would be disillusionment. In the process of being elected, the President invariably says or implies he will do more than he can do and some disaffection of once bemused supporters is all but inevitable. A most notable example would be the case of those who supported President Johnson in 1964 because he seemed opposed to escalation in Vietnam. Furthermore initial popularity ratings are puffed up by a variety of weak followers. These might include leering opposition partisans looking for the first excuse to join the aggrieved, excitable types who soon became bored by the humdrum of post-election existence, and bandwagon riders whose fair weather support dissolves with the first sprinkle.¹⁵ As Burns Roper notes, "In a sense, Presidential elections are quadriennial myth builders which every four years make voters believe some man is better than he is. The President takes office with most of the nation on his side, but this artificial 'unity' soon begins to evaporate."¹⁶

For these reasons the coalition of minorities variable, as it is dubbed here, predicts decline. "Love," said Machiavelli, "is held by a chain of obligation which, men being selfish, is broken whenever it serves their purpose."¹⁷

The coalition of minorities variable is measured simply by the length of time, in years, since the incumbent was inaugurated (for first terms) or re-elected (for second terms). It varies then from zero to about four and should be negatively correlated with popularity: the longer the man has been in office, the lower his popularity. It is; the simple r is -.47. The decline is assumed to start over again for second terms because the President is expected to have spent the campaign rebuilding his popular coalition by soothing the disaffected, re-deluding the disillusioned, and putting on a show for the bored. If he is unable to do this, he will not be re-elected, something which has not happened in the post-war era although twice Presidents have declined to make the effort.

The analysis will assume a *linear* decline in popularity. That is, a President's popularity is assumed to decline at an even rate for all four

¹⁷ *The Prince*, ch. XVII.

years of his term: if a decline of 6 percentage points per year is indicated, he will be down 6 points at the end of his first year, 12 at the end of the second, 18 at the end of the third, and 24 after four years. There is nothing in the justification for the coalition of minorities variable which demands that the decline must occur with such tedious regularity but, when curvilinear variants were experimented with, little or no improvement was found. Hence the reliance in this study on the linear version which has the advantage of simplicity and ease of communication.

2. The "rally round the flag" variable. This variable seeks to bring into the analysis a phenomenon often noted by students of the Presidency and of public opinion: certain intense international events generate a "rally round the flag" effect which tends to give a boost to the President's popularity rating. As Kenneth Waltz has observed, "In the face of such an event, the people rally behind their chief executive."¹⁸ Tom Wicker: "Simply being President through a great crisis or a big event . . . draws Americans together in his support."¹⁹ Richard Neustadt notes "the correspondence between popularity and happenings,"²⁰ Burns Roper finds "approval has usually risen during international crises,"²¹ and Nelson Polsky observes, "Invariably, the popular response to a President during international crisis is favorable, regardless of the wisdom of the policies he pursues."²²

The difficulty with this concept is in operationalizing it. There is a terrible temptation to find a bump on a popularity plot, then to scurry to historical records to find an international "rally point" to associate with it. This process all but guarantees that the variable will prove significant.

The strategy adopted here to identify rally points was somewhat different and hopefully more objective. A definition of what a rally point should look like was created largely on *a priori* grounds and then a search of historical records was made to find events which fit the definition. Most of the points so identified *are* associated with bumps on the plot—that after all was how the concept was thought of in the first place—but quite a few are not and the

bumps associated with some are considerably more obvious than others.

In general, a rally point must be associated with an event which 1) is international and 2) involves the United States and particularly the President directly; and it must be 3) specific, dramatic, and sharply focused.

It must be international because only developments confronting the nation as a whole are likely to generate a rally round the flag effect. Major domestic events—riots, scandals, strikes—are at least as likely to exacerbate internal divisions as they are to soothe them.

To qualify as a rally point an international event is required to involve the United States and the President directly because major conflicts between other powers are likely to engender split loyalties and are less likely to seem relevant to the average American.

Finally the event must be specific, dramatic and sharply focused in order to assure public attention and interest. As part of this, events which transpire gradually, no matter how important, are excluded from consideration because their impact on public attitudes is likely to be diffused. Thus sudden changes in the bombing levels in Vietnam are expected to create a reaction while the gradual increase of American troops is not.

Errors in this process could occur by including events whose importance is only obvious in retrospect or by ignoring events like the Geneva summit of 1955 which may seem minor in historical perspective but were held significant at the time. For this reason more reliance has been put on indexes of newspaper content than on broad, historical accounts of the period.²³ In general if there has been a bias in selecting rally points it has been in the direction of excluding border-line cases. This was done in profound respect for the lack of public interest and knowledge on most items of international affairs.

At that, some 34 rally points were designated. In general they can be said to fall into six categories. First, there are the four instances of sudden American military intervention: Korea, Lebanon, the Bay of Pigs, and the Dominican Republic. A second closely related category encompasses major military developments in ongoing wars: in Korea, the Inchon landing and the Chinese intervention; in Vietnam, the Tonkin

1273423

Bay episode, the beginning of bombing of North Vietnam, the major extension of this bombing, and the Tet offensive. Third are the major diplomatic developments of the period: crises over Cuban missiles, the U-2 and atomic testing, the enunciation of the "Truman doctrine" with its offer of aid to Greece and Turkey, the beginning of, and major changes in, the peace talks in Korea and Vietnam, and the several crises in Berlin. Fourth are the two dramatic technological developments: Sputnik and the announcement of the first Soviet atomic test. The fifth category includes the meetings between the President and the head of the Soviet Union at Potsdam in 1945, Geneva in 1955, Camp David in 1959, Paris in 1960, Vienna in 1961, and Glassboro in 1967. While these events are rarely spectacular they, like crisis, do generate a let's-get-behind-the-President effect. Because they are far less dramatic—even if sometimes more important—Presidential conferences with other powers (e.g., the British at Nassau) are excluded as are American meetings with the Soviet Union at the foreign minister level.

Sixth and finally, as an analytic convenience the start of each Presidential term is rather arbitrarily designated as a rally point. Presidents Truman and Johnson came in under circumstances which could justifiably be classified under the "rally round the flag" rubric although the crisis was a domestic one. The other points all involve elections or re-elections which perhaps might also be viewed as a somewhat unifying and cathartic experience.

These then are the events chosen to be associated with the rally round the flag variable. No listing will satisfy everyone's perspective about what has or has not been important to Americans in this 24 year period. However, in the analysis the variable has proven to be a rather hardy one. Experimentation with it suggests the addition or subtraction of a few rally points is likely to make little difference.

The rally round the flag variable is measured by the length of time, in years, since the last rally point. It varies then from zero to a theoretical maximum of about four or an empirical one of 1.9. Like the coalition of minorities variable, it should be negatively correlated with popularity: the longer it has been since the last rally round the flag event, the lower the popularity of the incumbent. It is; the simple r is $-.11$. Some experiments with curvilinear transformations of the variable were attempted but, since improvement again was marginal at best, the variable has been left in linear form.

Each rally point is given the same weighting in the analysis. One effort to soften this rather crude policy was made. The rally points were

separated into two groups: "good" rally points (e.g., the Cuban missile crisis) in which the lasting effect on opinion was likely to be favorable to the President and "bad" one (e.g., the U-2 crisis, the Bay of Pigs) in which the initial favorable surge could be expected to be rather transitory. Two separate rally round the flag variables were then created with the anticipation that they would generate somewhat different regression coefficients. The differences however were small and inconsistent. The public seems to react to "good" and "bad" international events in about the same way. Thus, to this limited extent, the equal weighting of rally points seems justified.

In tandem, the concepts underlying the coalition of minorities and rally round the flag variables predict that the President's popularity will continually decline over time and that international crises and similar events will explain short term bumps and wiggles in this otherwise inexorable descent.²⁴

3. *The "economic slump" variable.* There is a goodly amount of evidence, and an even goodlier amount of speculation, suggesting a relationship between economic conditions and electoral behavior. The extension of such thinking to Presidential popularity is both natural and predated. Neustadt, for example, concludes the recession in 1958 caused a drop in President Eisenhower's popularity.²⁵

The economic indicator used here will be the unemployment rate. The statistic recommends itself because it is available for the entire period and is reported on a monthly basis.²⁶ It is used as a general indicator of economic health or malaise and is not taken simply as a comment about the employed. It is assumed that the individual respondent, in allowing economic perceptions to influence him, essentially does so by comparing how things are *now* with how they were when the incumbent began his present term of office. If conditions are worse, he is in-

²⁴ Roper notes that President Kennedy's highest point of popularity occurred after the Bay of Pigs invasion and concludes this fact says something special about that crisis event (*op. cit.*) But this phenomenon is due to *two* effects—the rally round the flag effect *and* the fact that the event occurred very early in Kennedy's administration when the value for the coalition of minorities variable was yet very low.

²⁵ *Op. cit.*, p. 97ff.

²⁶ Data were gathered from Geoffrey H. Moore (ed.), *Business Cycle Indicators*, Vol. II (Princeton: Princeton University Press, 1961), p. 122; and, for more recent data, issues of the *Monthly Labor Review*.

clined to disapprove the President's handling of his job, if things are better he is inclined to approve. The economic variable therefore becomes the unemployment rate at the time the incumbent's term began subtracted from the rate at the time of the poll.²⁷ It is positive when things are worse and negative when things are better. It should be negatively correlated with popularity. But it isn't.

Unemployment reached some of its highest points during the recessions under the Eisenhower administration. The problem, to be examined more fully in Section VI below, is that Eisenhower was a *generally* popular President. Thus even though his popularity seemed to dip during the recessions, high unemployment comes to be associated with a relatively popular President. This problem can be handled rather easily within regression analysis by assigning to each of the Presidential administrations a "dummy" variable, the care and feeding of which will be discussed more fully in Section III below.

However, even when this circumstance is taken into account, the correlation coefficient and the regression coefficient for the economic variable remain positive. This seems to be largely due to the fact that *both* unemployment and the popularity of the incumbent President were in general decline between 1961 and 1968. The correlation for the period is .77.

Therefore a final alteration administered to the economic variable was to set it equal to zero whenever the unemployment rate was lower at the time of the survey than it had been at the start of the incumbent's present term. This alteration is a substantive one and is executed as the only way the data can be made to come out "right." In essence it suggests that *an economy in slump harms a President's popularity, but an economy which is improving does not seem to help his rating*. Bust is bad for him but boom is not particularly good. There is punishment but never reward.

Perhaps this can be seen in a comparison of the 1960 and the 1968 campaigns. In 1960, as

²⁷ One wrinkle, which is intuitively comfortable but makes little difference in the actual results, was to do something about the unemployment rates at the start of the first terms of Presidents Truman and Eisenhower when unemployment was "artificially" depressed due to ongoing wars. Presumably the public would be understanding about the immediate postwar rise in unemployment. Therefore for these two terms the initial unemployment level was taken to be that level which held six months after the war ended while the economic variable for the few months of the war and the six month period was set equal to zero.

Harvey Segal notes, "What was important was the vague but pervasive feeling of dissatisfaction with the performance of the economy, the pain that made the public receptive to JFK's appeals."²⁸ In 1968, representing administrations that had presided over an unprecedented period of boom, Vice President Humphrey never seemed able to turn this fact to his advantage.

It is important to note that in practice this variable, which will be called the "economic slump" variable because of its inability to credit boom, takes on a non-zero value only during the Eisenhower administration and during the unemployment rise of 1949-50. In symbolic form the variable's peculiarities can be expressed in the following; the units are the percentage of unemployed:

$$E = U_t - U_{t_0} \quad \text{if } U_t - U_{t_0} > 0 \\ = 0 \quad \text{if } U_t - U_{t_0} \leq 0$$

where

U_t = Unemployment rate at the time of the survey

and

U_{t_0} = Unemployment rate at the beginning of the incumbent's present term

4. *The "war" variable.* It is widely held that the unpopular, puzzling, indecisive wars in Korea and Vietnam severely hurt the popularity of Presidents Truman and Johnson.²⁹ As noted in the quotation that heads this report, President Johnson himself apportions 20 percentage points of his drop in popularity to the Vietnam War.

This notion seems highly plausible. The popularity of Presidents Truman and Johnson was in steady decline as the wars progressed with record lows occurring during each President's last year in office at points when the wars seemed most hopeless and meaningless. The wars unquestionably contributed in a major way to their decisions not to seek third terms and then, when they had stepped aside, the wars proved to be major liabilities for their party's candidates in the next elections. Overall, the correlation between Presidential popularity and the presence of war is -.66.

There are problems with this analysis, however. The coalition of minorities concept argues that decline is a natural phenomenon and, indeed, a glance at a plot of Presidential popularity clearly shows Truman and Johnson in decline *before* the wars started. Furthermore, as

²⁸ "The Pain Threshold of Economics in an Election Year," *New York Times*, July 15, 1968.

²⁹ Waltz, *op. cit.*, pp. 273ff, 288; Neustadt, *op. cit.*, pp. 97-99; Wicker, *op. cit.*; Roper, *op. cit.*

will be seen, both men experienced noticeable declines during their *first* terms when they had no war to contend with. The real question is, then, did the war somehow add to the decline of popularity beyond that which might be expected to occur on other grounds?

An answer can be approached through multiple regression analysis. After allowing for a general pattern of decline under the coalition of minorities variable, the additional impact of a variable chosen to represent war can be assessed. It is also possible in this manner to compare the two wars to see if their association with Presidential popularity differed.

The presence of war is incorporated in the analysis simply by a dummy variable that takes on a value of one when a war is on and remains zero otherwise. The beginning of the Vietnam War was taken to be June 1965 with the beginnings of the major US troop involvement. At that point it became an American war for the public; before that ignorance of the war was considerable: as late as mid-1964, 25 percent of the public admitted it had never heard of the fighting in Vietnam.³⁰

Other war measures of a more complex nature were experimented with. They increase in magnitude as the war progresses and thus should be able to tap a wearying effect as the years go by and should be negatively associated with popularity. These measures, however, are very highly correlated with the coalition of minorities variable for the two relevant Presidential terms and thus are all but useless in the analysis. The simple dummy variable suffers this defect in lesser measure, although it is far from immune, and thus, despite its crudities, has been used.³¹

5. *Other variables.* The analysis of Presidential popularity will apply in various ways only the four variables discussed above—a rather austere representation of a presumably complex process. As will be seen, it is quite possible to get a sound fit with these four variables, but at various stages in the investigation—

which involved the examination of hundreds of regression equations—a search was made for other variables which could profitably be added to the predictor set.

International developments are reasonably well incorporated into the analysis with a specific variable included for war and another for major crisis-like activities. Domestically, however, there is only the half-time variable for economic slump and the important but very unspecific coalition of minorities variable.

Accordingly it would be valuable to generate some sort of domestic equivalent to the rally round the flag variable to assess more precisely how major domestic events affect Presidential popularity. Operationally, however, this is a difficult task. First, while it is a justifiable assertion that international crises will rebound in the short term to a President's benefit it is by no means clear how a domestic crisis, whether riot, strike, or scandal, should affect his popularity. Furthermore major domestic concerns have varied quite widely not only in intensity and duration, but also in nature. Labor relations, which rarely made big news in the mid-1960s, were of profound concern in the middle and late 1940s as a multitude of major strikes threatened to cripple the nation and the adventures of John L. Lewis and the Taft-Hartley bill dominated the headlines. In the 1950s, however, labor broke into the news only with an occasional steel or auto strike or with the labor racketeering scandals in the last years of the decade. On the other hand, race relations, of extreme importance in the 1960s, made, except for the Little Rock crisis of 1957 and an occasional election-time outburst, little claim to public attention before that time. From the late 1940s into the mid-1950s sundry spy and Communist hunts were of concern, but the issue fairly well fizzled after that. Other issues which might be mentioned had even briefer or more erratic days in the sun: the food shortage of 1947, the MacArthur hearing of 1951, various space flights. Similarly, personal crisis for the Presidents such as heart attacks and major surgery for Presidents Eisenhower and Johnson and the attempted assassination of President Truman could not readily be fashioned into a predictor variable. In any event, these events seem to have far more impact on the stock market than on popularity ratings.

Scandal is a recurring feature of public awareness and thus is more promising as a potential variable in the analysis. Besides the scandals associated with alleged spies and Communists in the government during the McCarthy era and those associated with labor in the late 1950s, Americans, with greatly varying degrees

³⁰ A. T. Steele, *The American People and China* (New York: McGraw-Hill, 1966), p. 294. In May 1964 Gallup found almost two-thirds of the population said they paid little or no attention to developments in South Vietnam. Lloyd A. Free and Hadley Cantril, *The Political Beliefs of Americans* (New York: Clarion, 1968), pp. 59–60.

³¹ Although the Korean War continued into President Eisenhower's administration, he is not "blamed" for the war in the analysis since of course he was elected partly because of discontent over the war. Accordingly the war variable is set at zero for this period.

of pain, have suffered through the five percent scandal of 1949-50; charges of corruption in the RFC in 1951, in the Justice Department in 1952, and in the FHA in 1954; and scandals over Sherman Adams in 1958, over television quiz shows in 1959, over industry "payola" in the late 1950s, over Billie Sol Estes in 1962, and over Bobby Baker in 1963. While scandal is never worked into the regression analysis some preliminary suggestions as to its relevance to a "moral crisis" phenomenon which may in turn affect Presidential popularity are developed in Section VI below.

Some thought was given to including a "lame duck" variable when it was observed that the popularity of Presidents Truman and Johnson rose noticeably after they decided not to seek third terms. The trouble is, however, that President Eisenhower was a lame duck for his entire second term and it was found easier to ignore the whole idea than to decide what to do about this uncomfortable fact.

One domestic variable which did show some very minor promise was a dummy variable for the presence of a major strike. The variable takes on a zero value almost everywhere except in parts of President Truman's first term. After that time major strikes were rather unusual and, when they did occur, usually lasted for such a short time that there was barely time to have a public opinion survey conducted to test their effects. Despite these peculiarities, the variable did show statistical significance, though only after the Korean War dummy had been incorporated in the equation to allow for a major peculiarity of President Truman's second term. Substantively the variable suggests a popularity drop of less than three percentage points when a major strike is on and, as such a minor contributor, it is not included in the discussion below. Its small success, however, may suggest that further experimentation with the effects of specific domestic events could prove profitable.

III. RESULTS WITHOUT THE WAR VARIABLE

In summary the expected behavior of Presidential popularity is as follows. It is anticipated 1) that each President will experience in each term a general decline of popularity; 2) that this decline will be interrupted from time to time with temporary upsurges associated with international crises and similar events; 3) that the decline will be accelerated in direct relation to increases in unemployment rates over those prevailing when the President began his term, but that improvement in unemployment rates will not affect his popularity one way or the other; and 4) that the President will experience an additional loss of popularity if a war is on.

In this section the relation of the first three variables to Presidential popularity will be assessed. In the next section the war variable will be added to the analysis.

The association between the first three variables and Presidential popularity is given in its baldest form in equation 1 in Table 1.³² The equation explains a respectable, if not sensational, 22 percent of the variance. The coalition of minorities variable shows, in conformity with the speculation above, a significant negative relationship. The equation suggests that, in general, a President's popularity rating starts at 69 percent and declines at a rate of about six percentage points per year.

However, while the coefficients for the rally round the flag and economic slump variables are in the expected direction, they are not significant either in a statistical or a substantive sense. The trouble with the economic slump variable was anticipated in the discussion about it in Section II: the economic decline occurred during the relatively popular reign of President Eisenhower; while the slump seems to have hurt his popularity, even with the decline he remained popular compared to other Presidents: hence what is needed is a variable to take into account this peculiar "Eisenhower effect."

To account for this phenomenon, equation 2 mixes into the analysis a dummy variable for each of the Presidents. This formulation insists that all Presidents must decline (or increase) in popularity at the same rate but, unlike equation 1, it allows each President to begin at his own particular level. Thus peculiar effects of personality, style, and party and of differences in the conditions under which the President came into office can be taken into account.³³

The addition improves things considerably.

³² Each equation is displayed vertically. The dependent variable, the percentage approving the way the President is handling his job, has a mean of 57.5 and a standard deviation of 14.8. The number of cases is 292. The figures in parentheses are the standard errors for the respective partial regression coefficients. To be regarded statistically significant a regression coefficient should be, conventionally, at least twice its standard error. All equations reported in this study are significant (F test) at well beyond the .01 level. The Durbin-Watson *d* is an indicator of serial correlation which suggests decreasing positive serial correlation as the statistic approaches the value of 2.0. All equations in this study exhibit a statistically significant amount of positive serial correlation.

³³ The dummy variables formalize the sort of discussion found in Neustadt, *op. cit.*, p. 98. They account for what a singer might call tessitura.

TABLE 1. REGRESSION RESULTS INCLUDING ADMINISTRATION EFFECTS

	Equations			
	(1)	(2)	(3)	(4)
Intercept	69.37	54.51	68.15	71.52
Independent variables				
Coalitions of minorities (in years)	-6.14 (0.71)	-5.12 (0.48)		
Rally round the flag (in years)	-0.31 (1.95)	-2.15 (1.35)	-1.87 (1.07)	-2.63 (1.07)
Economic slump (in % unemployed)	-0.09 (0.96)	-3.18 (0.75)	-5.30 (0.60)	-5.86 (0.60)
Dummy variables for administrations				
Eisenhower		24.08 (1.42)	0.51 (2.29)	
Kennedy		23.87 (1.82)	11.33 (2.96)	
Johnson		10.46 (1.54)	4.26 (2.48)	
Coalition of minorities variable for administrations (in years)				
Truman			-11.44 (0.84)	-12.54 (0.50)
Eisenhower			0.83 (0.57)	0.13 (0.47)
Kennedy			-5.96 (1.36)	-1.58 (0.82)
Johnson			-9.12 (0.67)	-8.68 (0.50)
<i>d</i>	.13	.30	.46	.44
Standard error of estimate	13.16	8.88	6.86	7.06
<i>R</i> ²	.22	.65	.79	.78

The fit is much better and the rally round the flag and economic slump variables attain respectable magnitudes in the predicted direction, although the rally round the flag variable does not quite reach statistical significance.

The equation suggests that the Presidents have declined at an overall rate of over five per-

centage points per year but that each has done so at his own particular level. President Truman's decline is measured from a starting point of 54.51 percent (when the dummy variables for the Eisenhower, Kennedy, and Johnson administrations are all zero). President Eisenhower declines from a much higher level, about 79 per-

cent (54.51 + 24.08), President Kennedy from 78 percent, and President Johnson from 65 percent.

The importance of these dummy variables clearly demonstrates that *an analysis of Presidential popularity cannot rely entirely on the variables discussed in Section II, but must also incorporate parameters designed to allow for the special character of each administration.* To an extent this is unfortunate. The beauty of equation 1 is that it affords a prediction of a President's popular rating simply by measuring how long he has been in office, how long it has been since the last rally point, and how many people are unemployed. Such predictions, however, would be quite inaccurate because the fit of the equation is rather poor. Instead one must include the administration variables, the magnitudes of which cannot be known until the President's term is over. So much for beauty.

In equation 3 administration effects are incorporated in a different manner, greatly improving fit and reducing serial correlation. In this formulation each President is allowed to begin at his own level of popularity as in equation 2, but in addition each may decline (or increase) at his own rate: for each administration there is a different coefficient for the coalition of minorities variable. Three of the four values so generated are strongly significant while the magnitudes of the administration dummies drop greatly. When the administration dummies are dropped entirely from consideration, as in equation 4, the regression coefficients mostly remain firm and the fit of the equation is scarcely weakened. It is clear that *the important differences between administrations do not lie so much in different overall levels of popularity, but rather in the widely differing rates at which the coalition of minorities variable takes effect.*

The popular decline of Presidents Truman and Johnson has been almost precipitous. President Truman's rating fell off at some 11 or 12 percentage points per year while President Johnson declined at a rate of around 9 points a year. President Kennedy was noticeably more successful at holding on to his supporters. Then there is the Eisenhower phenomenon: in spite of all the rationalizations for the coalitions of minorities concept tediously arrayed in Section II, President Eisenhower's rating uncooperatively refuses to decline at all.³⁴

³⁴It was noted in Section I that some minor bias in these results is introduced by an embellished rate of "no opinion" in the first weeks of the Kennedy and first Eisenhower terms. As this rate declined, there was some tendency for the Presidents' approval and disapproval rates to rise. To

In equation 3, Presidents who served two terms were required to begin each term at the same level and their rate of decline or increase also had to be the same in each term. Liberation from these restrictions is gained in the rather cluttered equation 5 of Table 2 which is like equation 3 except that it affords a term by term, rather than simply an administration by administration comparison. As can be seen President Eisenhower managed a statistically significant *increase* of popularity of some two and a half percentage points per year in his first term. His second term ratings showed a more human, but very minor and statistically non-significant decline.³⁵

No important differences emerge in the Eisenhower phenomenon when the economic slump variable, which functions mainly during the Eisenhower years, is dropped from the equation.

No matter how the data are looked at then the conclusion remains the same. *President Eisenhower's ability to maintain his popularity, especially during his first term, is striking and unparalleled among the postwar Presidents.* An examination of some of the possible reasons for this phenomenon is conducted in Section VI below.

The rally round the flag and the economic slump variables emerge alive and well in equations 3, 4, and 5 (and 6). Both are usually statistically significant but their substantive importance varies as one moves from an administration by administration formulation of the coalition of minorities variable (equations 3 and 4) to the term by term formulation in Table 2. Specifically, the rally round the flag variable gets stronger while the economic slump variable weakens.

The rally round the flag variable is very much a parasite—it is designed to explain bumps and wiggles on a pattern measured mainly by the other variables. Consequently the rally round the flag variable does very poorly on its own and only begins to shine when the overall trends become well determined by the rest of

see if this peculiarity had any major impact, equations 3 and 4 were recalculated using the percentage *disapproving* as the dependent variable. This manipulation causes no fundamental differences, although President Eisenhower's rating behaves a little less outrageously.

³⁵If the term dummies are dropped from the equation to attain a version comparable to equation 4, the Eisenhower phenomenon holds except that his first term increase drops to 2.00 (still significant) and his second term decrease is a slightly steeper -0.36 (still not significant).

TABLE 2. REGRESSION RESULTS INCLUDING TERM EFFECTS AND THE WAR VARIABLES

	Equations	
	(5)	(6)
Intercept	72.00	72.38
Independent variables		
Rally round the flag (in years)	-4.88 (1.04)	-6.15 (1.05)
Economic slump (in % unemployed)	-2.67 (0.65)	-3.72 (0.65)
Dummy variables for terms		
Truman—second	-15.25 (3.69)	-12.41 (3.57)
Eisenhower—first	-3.17 (3.15)	-2.41 (3.02)
Eisenhower—second	-5.30 (3.07)	-4.35 (2.94)
Kennedy	7.53 (3.29)	7.18 (3.14)
Johnson—first	7.14 (5.50)	6.77 (5.26)
Johnson—second	-1.15 (3.06)	-0.79 (3.25)
Coalition of minorities variable for terms (in years)		
Truman—first	-9.21 (1.41)	-8.93 (1.35)
Truman—second	-7.98 (1.00)	-2.83 (1.37)
Eisenhower—first	2.45 (0.85)	2.58 (0.82)
Eisenhower—second	-0.07 (0.65)	0.22 (0.62)
Kennedy	-5.11 (1.21)	-4.76 (1.16)
Johnson—first	-4.98 (14.01)	-3.71 (13.39)
Johnson—second	-8.15 (0.66)	-8.13 (0.80)
Dummy variables for wars		
Korea		-18.19 (3.43)
Vietnam		-0.28 (2.79)
<i>d</i>	.57	.67
Standard error of estimate	6.07	5.80
<i>R</i> ²	.84	.86

the equation. In the end, *the rally round the flag variable suggests a popularity decline of around five or six percentage points for every year since the last rally point*—about the same magnitude as the coalition of minorities variable in its general state as in equations 1 and 2.

The declining fortunes of the economic slump variable suggest that the variable in equations 3 and 4 was partly covering for the differences between the two Eisenhower terms: the first term was associated with increasing popularity and a smaller recession, the second with somewhat declining popularity and a larger recession. With the Eisenhower terms more thoroughly differentiated in equation 5, the variable is reduced to a more purely economic function. The magnitude of the coefficient of the *economic slump variable* in this equation suggests a decline of popularity of about three percentage points for every percentage point rise in the unemployment rate over the level holding when the President began his present term. Since the unemployment rate has varied in the postwar period only from about 3 to 7 percent, the substantive impact of the economic slump variable on Presidential popularity is somewhat limited.

IV. RESULTS WITH THE WAR VARIABLE ADDED

The variable designed to tap the impact on Presidential popularity of the wars in Korea and Vietnam was applied with no great confidence that it would prove to have an independent, added effect when the coalition of minorities had already been incorporated into the equation especially given the problem of multicollinearity. It is obvious from a perusal of a plot that, as noted in Section II and as demonstrated in equation 5, Presidents Truman and Johnson were in popular decline during their warless first terms.³⁶ Furthermore each was in clear decline in the first part of his second term before the wars started and it is not at all obvious that this trend altered when the wars began.

The equations suggest otherwise, however. When a war dummy was appended to the equations already discussed, it emerged significant and suggested that the presence of war depressed the popularity of Presidents Truman and Johnson by over seven percentage points.

The next step, obviously, was to set up a separate dummy variable for each war. This brought forth the incredible result documented in equation 6: *the Korean War had a large, significant, independent negative impact on President Truman's popularity of some 18 percentage points, but the Vietnam War had no independent impact on President Johnson's popularity at all.*

Confronted with a result like this, one's first

³⁶ Regression statistics relating to President Johnson's first term are very unreliable, as the size of the standard errors suggests, because the popularity question was posed so few times during this brief period.

impulse is to do something to make it go away. This impulse was fully indulged. Variables were transformed and transmuted, sections of the analysis were reformed or removed, potentially biasing data were sectioned out. But nothing seemed to work. The relationship persisted. In fact under some manipulations the relationship became stronger.

One's second impulse, then, is to attempt to explain the result. One speculates.

The wars in Korea and Vietnam differed from each other in many respects, of course, but it seems unlikely that these differences can be used in any simple manner to explain the curious regression finding. This is the case because, as one study has indicated, public response to the wars themselves was much the same. Support for each war, high at first, declined as a logarithmic function of American casualties—quickly at first, then more slowly. The functions for each of the wars for comparable periods were quite similar. Furthermore both wars inspired support and opposition from much the same segments of the population.³⁷

Therefore it is probably a sounder approach in seeking to explain the regression finding to look specifically at popular attitudes toward the *President's relation to the war*, rather than to perceptions of the war itself. A comment by Richard Neustadt seems strikingly relevant in this respect. "Truman," he observes, "seems to have run afoul of the twin notions that a wartime Chief Executive ought to be 'above politics' and that he ought to help the generals 'win.'"³⁸

President Johnson seems to have run considerably less afoul. In seeking to keep the war "above politics," he assiduously cultivated bipartisan support for the war and repeatedly sought to demonstrate that the war effort was simply an extension of the policies and actions of previous Presidents. He was especially successful at generating public expressions of approval from the most popular Republican of them all: General Eisenhower. Vocal opposition to the war in Vietnam came either from groups largely unassociated with either party or from members of the President's own party. Then, when the latter opposition began to move from expressions of misgivings at congressional hearings to explicit challenges in the primaries, President Johnson removed himself from the battle precisely, he said, to keep the war "above politics." And, while there were occasional com-

plaints from the right during Vietnam that President Johnson had adopted a "no win" policy there, these were continually being undercut by public statements from General William Westmoreland—a man highly respected by the right—insisting that he was receiving all the support he needed from the President and was getting it as fast as he needed it.

If these observations are sound, the single event which best differentiates the impact of the Korean and Vietnam wars on Presidential popularity was President Truman's dismissal of General Douglas MacArthur. That move was a major factor in the politicization of the war as Republicans took the General's side and echoed his complaints that it was the President's meddling in policy that was keeping the war from being won.³⁹

The differing impact of the wars on Presidential popularity therefore may be due to the fact that Korea became "Truman's war" while Vietnam never in the same sense really became "Johnson's war."⁴⁰

³⁹ See John W. Spanier, *The Truman-MacArthur Controversy and the Korean War* (Cambridge, Mass.: Belknap, 1959); also Neustadt, *op. cit.*, passim; and Trumbull Higgins, *Korea and the Fall of MacArthur* (New York: Oxford, 1960). See also the data in George Belknap and Angus Campbell, "Political Party Identification and Attitudes Toward Foreign Policy," 15 *Public Opinion Quarterly* 601-23 (Winter 1951-52). Note especially the strong party polarization on the issue. That the public was strongly inclined to support General MacArthur in the dispute can be seen from poll data. The first polls, conducted as the General was making his triumphal, "old soldiers never die" return to the United States in April 1951, suggest more than twice as many people supported the General as supported the President. As Neustadt suggests (*op. cit.*, p. 97), emotion on the issue faded during the Senate Hearings on the issue which lasted until June and this seems to have been to the benefit of President Truman's position. The Truman point of view received its greatest support in late June and early July as peace talks were being begun. As the talks began to prove unproductive, however, public opinion began to revert to its previous support of General MacArthur, until, by the first days of 1952 (when the polling agencies grew bored with the issue), the MacArthur position was as strongly approved and President Truman's as strongly rejected as ever.

⁴⁰ There is evidence which suggests that World War II, a much more popular (and much larger) war than either Korea or Vietnam, may have worked to the distinct benefit of President Roose-

³⁷ John E. Mueller, "Patterns of Popular Support for the Wars in Korea and Vietnam," unpublished paper, Department of Political Science, University of Rochester, 1969.

³⁸ *Op. cit.*, p. 97.

One other item of speculation might be put forth. Domestically, the war in Vietnam was accompanied by a profoundly important crisis as America confronted its long-ignored racial dilemma head on. There seems to have been nothing comparable during the Korean War. The clamor associated with McCarthyism comes to mind but many analysts feel that, however important to politicians, intellectuals, and journalists, McCarthyism was of rather less than major concern to public opinion.⁴¹ Furthermore its dramatic climax, the Army-McCarthy hearings, took place months after the Korean War had ended and over a year after President Truman left office.

It may be, then, that the discontent associated with the racial crisis was enough by itself to cause much of President Johnson's popular decline and thus that the unhappiness over the Vietnam War could make little additional inroad. In the Truman case, there was no profound independent domestic source of discontent: his second term coalition of minorities decline is usually found as in equation 5 to have been less than his first term decline and when, as in equation 6, a variable has already accounted for the war effect, his decline is quite moderate. Thus in a sense there was "room" for the war to have an independent impact.

It would be wise in concluding this section to emphasize what has and what has not been said. It has *not* been argued that the war in Vietnam had nothing to do with President Johnson's decline in popularity and thus the analysis cannot really be used to refute the President's own estimation of the impact of Vietnam as indicated in the quotation that heads this study. However it is argued that whatever impact the war had was tapped by the other variables in the equation, especially the coalition of minorities variable which is specifically designed to account for general overall decline. When the same sort of anal-

ysis is applied in the Korean period it is found that a variable associated with the Korean War does show significance even after other variables have been taken into account. What the regression analysis shows therefore is that, while the Korean War does seem to have had an *independent, additional* impact on President Truman's decline in popularity, the Vietnam War shows no such relation to President Johnson's decline.

V. THE RESIDUALS

An analysis of the residuals finds that equation 6 predicts worst in President Truman's first term. The President's extremely high initial ratings are not well predicted suggesting that the equation does not adequately account for the trauma of President Roosevelt's death⁴² combined as it was with the ending of World War II and with important peace conferences. It was almost as if Americans were afraid to disapprove of President Truman.

From these spectacular highs, President Truman plunged to great lows during the labor turmoil of 1946. These ratings are also badly specified by the equation. The Truman popularity rose in early 1947, as the labor situation eased, and then declined for the rest of the term. Thus while President Truman's first term, like the other Democratic terms, shows an overall decline of popularity, that decline was considera-

⁴¹ In late November 1945, over six months after President Roosevelt's death, Gallup asked his sample, "In your opinion, who is the greatest person living or dead, in world history?" Fully 28 percent proffered Roosevelt's name. Abraham Lincoln was mentioned by 19 percent, Jesus Christ by 15 percent, and George Washington by 8 percent. No one else received more than 2 percent. And the aura lasted. A survey conducted in June 1949 in the city of Philadelphia (which had voted 59 percent for Roosevelt in 1944 as against a national rate of 55 percent) posed this question: "Could you tell us the name of a great person, living or dead, whom you admire the most?" The most commonly mentioned names were Roosevelt with 42 percent, Lincoln with 9 percent, and Washington with 5 percent. (The absence of Jesus Christ on this latter list presumably can be laid to the peculiarities of question wording—or of Philadelphians.) Fillmore H. Sanford, "Public Orientation to Roosevelt," 15 *Public Opinion Quarterly* 190-91, 200 (Summer 1951). In 1948, Roper found 43 percent of a national sample offering Roosevelt's name when queried, "Considering all the men in America who have been prominent in public affairs during the past 50 years, which one or two have you admired the most?" Dwight Eisenhower was second at 17 percent. E. Roper, *op. cit.*, p. 22.

⁴² Samuel A. Stouffer, *Communism, Conformity, and Civil Liberties* (Garden City, N.Y.: Doubleday, 1955), especially ch. 3; Campbell, *et al.*, *op. cit.*, pp. 50-51; Nelson W. Polsby, "Toward an Explanation of McCarthyism," 8 *Political Studies* 250-71 (October 1960); Elmo Roper, *You and Your Leaders* (New York: Morrow, 1957), pp. 250-51.

bly more erratic than the others. The dummy variable for strikes, discussed briefly in Section II, improved matters only slightly.

Beyond this, the residuals are reasonably well behaved. There are small but noticeable effects from the lame duck phenomenon at the end of the Truman and Johnson administrations and from the "no opinion" peculiarity of the initial weeks of the Eisenhower and Kennedy administrations. And here and there are data points whose magnitudes have somehow managed to escape specification by the variables in the regression equation. One can of course generate a unique explanation for each of these but this procedure clutters the analysis more than it is worth. Besides, the laws of sampling insist that Gallup must have made *some* mistakes.

As the magnitude of the Durbin-Watson d indicates, serial correlation has by no means been eliminated in the regression equations. Allowing the coalition of minorities variable to be specified for each term improved things considerably, but much is left to be desired.

VI. THE EISENHOWER PHENOMENON

Great noise was made in Section II about the coalition of minorities variable with its stern prediction that a President's popularity would decline inexorably over his four year term. The noise was not entirely unjustified since the variable proved to be a hardy and tenacious predictor for the postwar Democratic administrations.

The variable fails for the Eisenhower administration, however, especially for the General's first term. The analysis suggests then that if a President wants to leave office a popular man he should either 1) be Dwight David Eisenhower, or 2) resign the day after inauguration.

The Eisenhower phenomenon, noted but left dangling without explanation or rationalization in Section III, deserves special examination. Why didn't President Eisenhower decline in popularity like everybody else? A number of suggestions can be proffered.

1. To begin with, credit must be given to President Eisenhower's *personal appeal*: he was extremely likeable—a quality very beneficial in a popularity contest and one lacked in abundance by, say, Lyndon Johnson. As Fillmore Sanford has observed, "The American people, in reacting to a national leader, put great emphasis on his personal warmth"⁴³—a quality projected to an unusual degree by President Eisenhower. As part of this, he was able to project an image of integrity and sincerity which many found to be enormously attractive.⁴⁴

⁴³ *Op. cit.*, p. 198.

⁴⁴ See Philip E. Converse and Georges Dupeux,

2. Early in his first term President Eisenhower was able to present to the public one sensational achievement: he *ended the Korean War*—or, at any rate, presided over its end. This accomplishment was seen by the public as he left office to be a great one⁴⁵ and was used with profit by the Republicans in a Presidential campaign a full 15 years after it happened. From the standpoint of public opinion it may well have been the most favorable achievement turned in by any postwar President. As such it may have tended to overwhelm the negative impact of anything else the President did, at least for the first years of his administration. Some credit for this is given in the regression analysis since the signing of the truce is counted as a rally point, but this may be a totally inadequate recognition.

There is another aspect of President Eisenhower's first term which may not be sufficiently accounted for in the rally round the flag variable: the euphoria of the "spirit of Geneva" period toward the end of the term when the President's popularity should have been at its lowest ebb.

3. President Eisenhower's *amateur status* may also have worked to his benefit, at least for a while. The public may have been more willing to grant him the benefit of a doubt, to extend the "honeymoon" period, than it would for a President who is a political professional. It is also easier under these circumstances for the President to appear "above the battle" and thus to be blamed only belatedly and indirectly for political mishaps, thereby softening their impact.

4. President Eisenhower may have been curiously benefited by the fact that, especially on the domestic front, *he didn't do anything*.⁴⁶ In-

"De Gaulle and Eisenhower: The Public Image of the Victorious General," in Angus Campbell, *et al.*, *Elections and the Political Order* (New York: Wiley, 1966), pp. 292-345.

⁴⁵ In December 1960 the public was asked what it felt was Eisenhower's greatest accomplishment. The ending of the Korean War was mentioned by 11 percent and a related comment, "except us out of war," was suggested by an additional 32 percent. No other specific accomplishment was mentioned by more than 5 percent; only 1 percent mentioned anything having to do with the domestic scene. See also Neustadt, *op. cit.* p. 98.

⁴⁶ As Irving Kristol argues, "... when a conservative administration does take office, it pursues no coherent program but merely takes satisfaction in not doing the things that the liberals may be clamoring for. This, in effect, is what happened during the two terms of President Eisen-

deed analysts of the Eisenhower administration often argue that its contribution lies in what it *didn't* do. The times called for consolidation, they argue, and President Eisenhower's achievement was that he neither innovated nor repealed, but was content to preside over a period of placidity in which he tacitly gave Republican respectability to major Democratic innovations of earlier years: the programs of the New Deal domestically and the policies of the Truman Doctrine internationally.⁴⁷

In terms of the justification for the coalition of minorities variable as discussed in Section II, such behavior could have a peculiar result. It was assumed in part that the President would enact programs which, while approved by the majority, would alienate intense minorities which would gradually cumulate to his disadvantage. But suppose the President doesn't do anything. Those who want no change are happy while, if things are sufficiently ambiguous, those who support change have not really been denied by an explicit decision and can still patiently wait and hope. At some point of course those who want change begin to see that they are never going to get their desires and may become alienated, but this will be a delayed process. At least in moderate, placid times, a conservative policy may dissipate some of the power of the coalition of minorities phenomenon. Were polls available, one might find that President Warren Harding maintained his popularity as strikingly as President Eisenhower.

5. Although it might be difficult to sort out cause and effect, it is worth noting that President Eisenhower's first term (and most of his second) coincided with a *period of national goodness*. In a brilliant article Meg Greenfield has noted that "moral crises" as appraised and bemoaned by intellectuals seem to follow a cyclic pattern: we go through a period in which the popular journals are filled with articles telling us how bad we are after which there is a period of respite.⁴⁸

Miss Greenfield's main indicator of these ethical cycles is exquisite: the number of items under the heading, "US: Moral Conditions," in the *Readers' Guide to Periodical Literature*. The pattern, elaborated and duly pedantified, is given in Table 3. As she notes, our first moral

hower . . . "The Old Politics, the New Politics, and the New, New Politics," *New York Times Magazine*, November 24, 1968, p. 167.

1968	10

crisis in the postwar period arose in the early 1950s and was associated with "five percenters," deep freezes, mink coats, the Kefauver hearings, and a series of basketball fixes," while "the symbols of our present [1961] decline are Charles Van Doren, payola, cheating in school, and the decision of Frances Gary Powers not to kill himself." We never recovered as thoroughly from that crisis as we did from the earlier one for, as the crisis showed signs of waning (the success of the Peace Corps began to show how good we were at heart), new elements—Billie Sol Estes, Bobby Baker, President Kennedy's assassination, campus revolts, the hippies, and the city riots—proved once again that we have a "sick society." Our moral crises are regenerated every eight years and seem to coincide with the end of Presidential administrations.⁴⁹

⁴⁹ It may, or then again may not, be worth noting that Presidential elections in which the incumbent party was removed, 1952, 1960, and 1968, occurred during moral crises while the elections in which the President was retained, 1948, 1956, and 1964, all took place during times of relative goodness.

Of course objective indicators of public morality have not been careening in this manner. Much of the fluctuation in the Greenfield index is no doubt due to journalistic fad. A sensational fraud, scandal or disruption causes theologians, journalists, and other intellectuals to sociologize: society is sick. Others pick up the idea and it blossoms into a full moral crisis. In a year or two the theme no longer sells magazines and the space is filled with other profundities. Fraud, scandal, and disruption continue, but the moral crisis eases.

But—and this is a logical and empirical leap of some magnitude—to the extent that these patterns reflect and influence public attitudes, they may be relevant to Presidential popularity. The early Eisenhower years are notable for their absence of moral anguish and they differ from other between-crisis periods in an important respect: not only were we not demonstrably bad, we were positively good for we were undergoing a religious revival. Miss Greenfield looked at the items under the heading, "US: Religious Institutions." She finds only six items in the 1951–53 period, but 25 in 1953–55 while "in the 1955–57 volume, at the height of our virtue . . . the religious listings reached thirty-four with twenty-eight 'see alsos.'"

If we were so good ourselves, how could we possibly find fault in our leader?

VII. FURTHER RESEARCH

This study has been reasonably successful at generating a regression equation based on only four rather simple variables, which fits quite well the erratic behavior over 24 years of the Presidential popularity index. There is, however, much room for improvement and refinement.

Little has been done to separate out from the coalition of minorities variable the specific and divergent influences of domestic events on Presidential popularity. There was one variable designed to account in a general way for changes in the economy, some limited analysis was made of the relevance of major strikes, and comments were interjected about the role of scandal and "moral crisis." But domestic life is considerably more complicated than this and more precise social, political, and economic indicators can be sought.

It would also be of value to get better estimates of the impact of different *kinds* of international events on Presidential popularity—although, as already suggested, such analysis may find that all dramatic international events affect popularity in much the same way no matter how they may differ in historical significance.⁵⁰

⁵⁰It may prove valuable to attempt to see how

The analysis strongly suggests that Presidential style as well as the ideological and political nature of the administration and the times can make a sizeable difference in the way popularity ratings behave. A more precise assessment of these relationships would be most desirable.

The study has dealt entirely with general popular approval of the President. Left unexamined are the ways population groups differ in their approach to the President. Supporters of the President's own party, for example, are more likely to approve the way he handles his job. Presumably they are also relatively hard to alienate, are more likely to be enchanted by his successes, and are more tolerant of his blunders.

It should also be possible to extend the analysis to other bodies of data. Somewhat comparable data from the Roosevelt administration are available. Although the popularity question was posed with far less regularity in those days (and was largely dropped during World War II) and although there are problems with varying question wording, students of President Roosevelt's popularity ratings emerge with findings which fit well with those of this study.⁵¹ The popularity ratings of Governors and Senators in states with active statewide polls can also be analyzed as can data on national leaders from such countries as Britain, Canada, and France.⁵²

spectacular and cumulative international events and shifts in governmental policy—to use the distinction made by Karl Deutsch and Richard Meritt—differ in impact. "Effects of Events on National and International Images" in Herbert C. Kelman (ed.) *International Behavior* (New York: Holt, 1965), pp. 132–87.

⁵¹Wesley C. Clark has found some relation between the Roosevelt popularity and the state of the economy in the 1937–1940 period. He also notes a general "downward slant" in the rating over time and finds a rise of popularity during international crises. ("Economic Aspects of a President's Popularity," Ph.D. Dissertation, University of Pennsylvania, 1943, pp. 41, 28, 35). See also B. Roper, *op. cit.*, and E. Roper, *op. cit.*, chapters 2 and 3. And V. O. Key has observed that during 1940 "the popularity of Roosevelt rose and fell with European crises." *Politics, Parties and Pressure Groups* (New York: Crowell, 1952, 3rd. ed.), p. 596 (cited in Waltz, *op. cit.*, p. 272.)

⁵²British observers have noted an apparent relation between unemployment and party preference in their country: rising unemployment seems to have benefited Labor while declining unemployment favors the Tories. Henry Durant, "Indirect Influences on Voting Behavior," 1 *Polls* 7–11 (Spring 1965). Extensive data from France on the popularity of President De Gaulle have been

VIII. SUMMARY

This investigation has applied multiple regression analysis to the behavior of the responses to the Gallup Poll's Presidential popularity question in the 24 year period from the beginning of the Truman administration to the end of the Johnson administration. Predictor variables include a measure of the length of time the incumbent has been in office as well as variables which attempt to assess the influence on his rating of major international events, economic slump, and war. Despite the austerity of this representation of a presumably complex process, the fit of the resulting equation was very good: it explained 86 percent of the variance in Presidential popularity.

This degree of fit could only be attained, however, by allowing the special character of each Presidential administration to be expressed in the equation. Thus it does not seem possible to predict a given President's popularity well simply by taking into account such general phenomena as the state of the economy or of international affairs.

The first variable, dubbed the "coalition of minorities" variable, found, as expected, the popularity of most Presidents to be in decline during each term. The important differences between administrations do not lie so much in different overall levels of popularity, but rather in the widely differing rates at which this coalition of minorities variable takes effect. Specifically, the popular decline of Presidents Truman and Johnson was quite steep while President Kennedy seems to have been somewhat better at maintaining his popularity. President Eisenhower's popularity did not significantly decline at all

during his second term and actually increased during his first term.

In considering this Eisenhower phenomenon it is suggested that a combination of several causes may be relevant: the President's personal appeal, his ending of the Korean War, his amateur status, his domestic conservatism at a time when such a policy was acceptable, and his fortune in coming to office at a time of national goodness.

The second variable, the "rally round the flag" variable, predicts short term boosts in a President's popularity whenever there occurs an international crisis or a similar event. The variable proves to be a sturdy one and suggests a popular decline of about five or six percentage points for every year since the last "rally point."

Economic effects were estimated in the third variable. The variable could only be made to function if it was assumed that an economy in slump harms a President's popularity, but an economy in boom does not help his rating. A decline of popularity of about three percentage points is suggested for every percentage point rise in the unemployment rate over the level holding when the President began his present term.

The fourth variable attempted to take into account the influence of war on Presidential popularity. It was found that the Korean War had a large, significant independent negative impact on President Truman's popularity of some 18 percentage points, but that the Vietnam War had no independent impact on President Johnson's popularity at all. It is suggested that this difference may be due to the relationship between the Presidents and the wars: President Truman was less able than President Johnson to keep the war "above" partisan politics and he seemed to the public to be interfering and restraining the generals. The absence in the Truman case of a domestic crisis comparable to the racial turmoil of the Johnson era may also be relevant.

published: for example, *Gallup Opinion Index*, March 1968, pp. 27-28. A study by Howard Rosenthal has investigated regional aspects of the General's popularity. "The Popularity of Charles De Gaulle: Findings from Archive-based Research," 31 *Public Opinion Quarterly* 381-98 (Fall 1967).

ON CIVIL DISOBEDIENCE IN RECENT AMERICAN DEMOCRATIC THOUGHT*

PAUL F. POWER

University of Cincinnati

Theoretical discussions of civil disobedience on ethical and political grounds received special attention in this country during the Nuremberg trials, the security and loyalty controversies of the 1950's and the pre-arms control years of nuclear power. A fourth wave of interest formed after the early civil rights protests and a fifth is appearing to consider dissent from national policies on the Vietnam War. In this paper civil disobedience is viewed from a trough between the fourth and most recent wave. The phenomenon is interpreted with selected ideas from the study of political obligation¹ and unconventional dissent. The essay first assesses recent American analysis of civil disobedience to determine what the criteria should be to distinguish it from other forms of political action and to discover its political ethics. Secondly, there is an attempt to answer the question: Is there any appreciable service that carefully defined civil disobedience might perform in American democratic thought? The complete enterprise is provoked by a need to examine new strategies for democratic citizenship in a time when the deficiencies of American political life are becoming known to increasing numbers and varieties of people instead of remaining the preserve of enlightened elites.

I. CURRENTS OF THOUGHT

The rule-breaking aspect of "civil disobedience," a term usually credited to Thoreau, offers fewer difficulties for an examination of the topic than the "civil" feature. Typically, "disobedience" is breaking a legal norm that has authoritative sanction. The norm does not have to be a state law but might be a rule of a subsidiary group, such as the university, which in American constitutional theory and practice has the right to make and enforce internal regulations, subject to the state's writ and charter. Although this discussion has implications for disobedience within subsidiary groups, in the main it revolves around citizen resistance to the laws and policies of the state. "Civil" is open to several interpretations. These five meanings cover most possibil-

ities:² 1) recognition of citizen obligations for the existing legal order; 2) the opposite of military; 3) civilized or moral; 4) public instead of private; and 5) affecting the political society. All of these, but especially 1), 3) and 5), are directly pertinent for the objectives of this paper. The meanings of both parts of the term become clarified when criteria are examined.

Many of the suggestions for the criteria of "responsible" civil disobedience can be identified with one or the other of two currents of thought and sometimes with both. One will be called "neo-conservative."³ It views political obligation from a stress on the rule of law as the balance-wheel between majority will and minority rights. The rule of law includes the judicial development of civil liberties and the legislative protection of civil rights. The pattern has no internal agreement about rates and kinds of innovations

seau, and notably T. H. Green who may have been the first to use the term. A study of Green's thought and environment is Melvin Richter, *The Politics of Conscience: T. H. Green and His Age* (Cambridge, Mass.: Harvard University Press, 1964). Reassessments include John R. Carnes, "Why Should I Obey The Law?," *Ethics*, 71 (1960), 14-26; Hanna Pitkin, "Obligation and Consent," *This Review*, 59 (1965), 990-1000, and 60 (1966), 39-52; John Plamenatz, *Consent, Freedom and Political Obligation*, 2nd ed. (New York: Oxford University Press, 1968); T. C. Pocklington, "Protest, Resistance, and Political Obligation," a paper presented at the 1969 Annual Meeting of the American Political Science Association, New York, September 3-6, 1969; and Joseph Tussman, *Political Obligation and the Body Politic* (New York: Oxford University Press, 1960).

Allen, "Civil Disobedience and the Legal Order," *University of Cincinnati Law Review*, 36 (1967), 1-38, 175-195; Abe Fortas, *Concerning Dissent and Civil Disobedience* (New York: The New American Library, 1968); Erwin N. Griswold, "Dissent—1968," *Tulane Law Review*, 42 (1968), 726-739; and Sidney Hook, "Social Protest and Civil Disobedience," *The Humanist*, 27 (Sept.-Dec., 1967), 157-159, 192-193.

*Research for this project was supported by a summer faculty fellowship of the University of Cincinnati. I wish to thank John T. Bookman for helpful criticisms of an earlier version of my paper.

¹ Prominent commentary on political obligation was offered by Thomas Aquinas, Locke, Rous-

required to strengthen democracy. Yet, it sets a premium on acceptance of the out-put of the historical constitutional system as the hallmark of the good citizen. Reflecting more than a trace of positivism, the neo-conservative tendency sharply distinguishes between private motives and legal behavior. The current is unlikely to give any significant aid to an interpretation of sovereignty whereby the citizen realizes his true morality through conformity to the state's determination of right in the tradition of Bosanquet.³ Lacking dedication to this notion, the neo-conservative current participates in discussions of the special conditions under which civil disobedience might take place without endangering a democratic system.⁴ Its outlook, however, is often negative, aligning easily with the Kerner Report's finding that in the recent past "uncivil" disobedience shared with white terrorism and defiant officials the responsibility for creating a climate that encouraged and approved violent protest.⁵

The neo-conservative current sometimes approves or condones civil disobedience, especially to test the constitutionality of statutes, but it contrasts with a second current which welcomes the incorporation of responsible law-breaking into democratic theory as a beneficial, though rarely used, mechanism. This second alignment will be called "institutional libertarian" or simply "libertarian."⁶ Ranging from the idioms of

welfare capitalism to social democracy, it combines a defense of a legal democratic order with sponsorship of evolutionary changes in the distribution and uses of power to better meet human needs. Divided about a number of issues, the current has yet to show if its future lies with those concerned with perpetuating the due process tradition who attempt to define civil disobedience, such as Morris Keeton, or with "radical liberals" who are more interested in urging newer versions of democracy than in explaining how to achieve them.⁷ The libertarian persuasion often serves as an infrequently acknowledged ally of black power and radical New Left groups in their "anti-oligarchy" struggles. The relationship is not one whereby these groups offer substantial analysis of civil disobedience. For the black power advocates this condition may stem from an emphasis within the early civil rights movement, and certainly from without, on its obligation to use non-violent means. The older stress invalidates discussion of civil disobedience for newer black leaders who believe, as academicians came to believe about the anti-communist provision of the National Defense Act, that a minority community had been affronted, and it would no longer tolerate the condition.⁸ An explanation of why the radical New Left has not contributed to discussion of civil disobedience is that it tends to consider the phenomenon as little more than a mechanical strategy in the struggle against the alleged evils of the American and associated systems, causing a dearth of analysis according to values other than those of the crucible. The relative silence of the radical New Left about the philosophical significance of civil disobedience may be valid testimony that the subject is indeed worthless.⁹

507-525; and Michael Walzer, "The Obligation to Disobey," *Ethics*, 77 (1967), 163-175.

⁷ Civil disobedience is one, undefined form among many "disorderly surrogates" for socially acceptable types of protest in the stockpile of the "politics of radical pressure," recommended in Arnold S. Kaufman, *The Radical Liberal* (New York: Atherton Press, 1968), pp. 56-75, at 70.

⁸ The anti-patrician and self-determinist spirit is evident in Floyd B. Barbour (ed.), *The Black Power Revolt* (Boston: Sargent, 1968), and Nathan Wright, Jr., *Black Power and Urban Unrest* (New York: Hawthorn Books, 1967).

⁹ It is true that Herbert Marcuse has referred to "uncivil" disobedience. See *An Essay on Liberation* (Boston: Beacon Press, 1969), pp. 68-69. But his view of the phenomenon is controlled by beliefs that capitalist "pseudo-democracy" eventually absorbs any kind of non-mass opposition and hypocritically distracts attention from its own brutality through discovery of "illegitimate" re-

³ There are commentators whose alarm about civil disobedience suggests that there is a fully conservative category. See Morris I. Liebman, "Civil Disobedience—A Threat to Our Law Society," John W. Richm, "Civil Disobedience—A Definition," *American Criminal Law Quarterly*, 3 (1964), 21-26, 11-15; and former Justice Whittaker's remarks in Charles E. Whittaker and William Sloane Coffin, Jr., *Law, Order and Civil Disobedience* (Washington: American Enterprise Institute for Public Policy Research, 1967), pp. 1-25. A majority of the National Commission on the Causes and Prevention of Violence held that civil disobedience, including non-violent action, is potential anarchy: *New York Times*, Dec. 9, 1969, pp. 1, 44.

⁴ *Report of the National Advisory Commission on Civil Disorder* (Washington: Government Printing Office, 1968), p. 92.

⁵ Internal agreements on justification, and means and ends of ethical resistance provide considerable diversity to the current. But consult Hugo A. Bedau, "On Civil Disobedience," *The Journal of Philosophy*, 58 (1961), 653-665; Harrop A. Freeman and Bayard Rustin in Harrop A. Freeman, ed., *Civil Disobedience* (Santa Barbara: Center for the Study of Democratic Institutions, 1966), pp. 2-10, 10-13; Morris Keeton, "The Morality of Civil Disobedience," *Texa Law Review*, 43 (1965),

But since this paper's presumption is that the topic deserves study, it will have to proceed. Because black power and the radical New Left are not substantively concerned with civil disobedience, non-conservatives and libertarians are challenged to demonstrate that it is significantly involved in those broad issues of defining and reaching a better political life that energize non-debaters as well as many discussants.

Without pausing here to identify the specific points where the neo-conservative and libertarian currents agree or differ on the standards for "responsible" civil disobedience, I find that together they suggest the following criteria: 1) The act must be performed openly—secrecy is prohibited. 2) It must be a deliberate, not an accidental step. 3) The action is clearly unlawful, i.e., not permissible under existing laws and court interpretations of civil rights and liberties. 4) The illegal act is voluntary, not induced by others. 5) The conduct proceeds from "conscientious" dissent, inspired by moral or religious beliefs. 6) The objective sought is a concrete, public reform. 7) Legal remedies must be exhausted before disobedience is undertaken. 8) The disobedient is obligated to use "non-violent" means. 9) Throughout his challenge he demonstrates concern for the rights of others. 10) A proximate relation exists between the rule under attack and the reasons for dissent. 11) The disobedient must submit to the legal consequences of his act. This is not an exhaustive list, but it is suggestive of numerous criteria.

One can immediately comment on 1), 2) and 3). Meant to exclude subversion or evasion of law, the public test is open to a claim of exemption for some who violated the Fugitive Slave Law of 1850, the 18th Amendment and current state laws on abortions. If clandestine infractions are acceptable, perhaps only retrospective sorting by disinterested or "winning" historians can judge the disobedients. Meanwhile, one can reasonably expect that generally the public test must be met. The criterion of deliberate infraction is troublesome when the

public standard is forgiven, thus making proof difficult. To consider an act eligible for "responsible" civil disobedience in the absence of evidence of advertancy, one may have to assume, intending no entrapment, its deliberate commission. On the test of illegality, there would seem to be no great difficulty in accepting the standard. A problem is how to treat the opinion that civil disobedience is not involved when the breaking of a law is subsequently found to be no violation because the "law" was invalid under superior legislation or a constitutional ruling.¹⁰ To accept this view narrowly limits "civil disobedience" to unsuccessful, legal challenges and denigrates political and ethical justification of disobedience. This is an inhibiting prospect for political philosophy.

II. THE ISSUE OF "CONSCIENTIOUS" OBJECTION

On the assumption that the disobedient act must be public, deliberate and illegal, this paper will examine four tests of civil disobedience which are crucial for distinguishing it from other kinds of political action and exploring its political ethics. They are the criteria of "conscientious" objection, willingness to accept the legal consequences of disobedience, "non-violent" means, and a proximate relation between the target and the grievance. To take the first, the stipulation that the infraction must be based on moral or religious conviction, i.e., the dictates of one's conscience, is found among both neo-conservatives and libertarians. Although definitions are seldom offered, both groups tend to consider "conscience" as a sacred and sovereign monitor, operating as if in the presence of God, rather than to imply Freud's super-ego, a product of fear and guilt. Moreover, they tend to think of conscience responding to significant, public challenges.¹¹ Neo-con-

¹⁰ Legalists associated with federal civil rights activities have argued that civil disobedience is not present when rule-breaking is later held legal under existing Congressional legislation or Constitutional principles: William L. Taylor, "Civil Disobedience," in Donald B. King and Charles W. Quick (eds.), *Legal Aspects of the Civil Rights Movement* (Detroit: Wayne State University Press, 1965), pp. 227-235, at 228-229; and Burke Marshall, "The Protest Movement and the Law," *Virginia Law Review*, 51 (1965), 785-803, at 795-796. The focus of Taylor and Marshall is on the sit-ins in the early 1960's and the arrests that followed but never received Supreme Court approval.

¹¹ On the possibly quandary of the nuclear commander, see Guenter Lewy, "Superior Orders, Nuclear Warfare, and the Dictates of Conscience in the Atomic Age," *this Review*, 55 (1961), pp. 2-23.

sistance. *Ibid.*, pp. 64-65, 76-77. A radical New Left view of the national and world scene is Carl Oglesby's section in Carl Oglesby and Richard Schaul, *Containment and Change* (London: Collier-Macmillan, 1967), pp. 3-176. For a glimpse of strategy in Students for a Democratic Society targeting, see "The Rudd October Proposals," in Cox Commission Report, *Crisis At Columbia* (New York: Random House, 1968), Appendix B. The sources, ideas and literature of the New Left in Europe and the United States are reviewed in Rosemary Ruether, "The New Left: Revolutionaries After the Fall of the Revolution," *Soundings*, 51 (1969), 245-263.

servatives and libertarians are not alike on exemplification. Libertarians pay tribute to such exemplars as Gandhi and Thomas More. These men, it is held, demonstrated the qualities of mind and spirit and the political ethics which all potential rule-breakers should emulate. The neo-conservatives do not take this tack usually. A representative outlook is that of Erwin N. Griswold who, instead of valuing famous disobedients, gives recognition to the "forum of conscience" described in Chief Justice Hughes' dissent in *U.S. v. MacIntosh* as an area where "duty to a moral power higher than the state has always been maintained."¹² Having done this and acknowledged a moral right to commit civil disobedience when there is a conflict of loyalties, Griswold stresses that the act is a rare event never to be cloaked with the legitimacy of civil liberties as construed by the Supreme Court and seldom to be tolerated by the majority's legislative will. Although this rendering does not rule out innovative rule-breaking, the outlook implies that conscientious disobedience has few contributions to offer democratic theory.

In contrast, institutional libertarians find civil disobedience a potential resource. Frequently they show the influence of liberal theology and resistance ideas indebted to Roger Williams, the *Vindiciae Contra Tyrannos* and John Knox. Of special interest, these commentators provide for individual civil disobedience which the elitism of Reformation traditions normally would have excluded. The method is to interpret St. Peter's "Obey God rather than men" dictum (Acts 5:29) to deny the state's absolutism and to permit citizen disobedience by divine authority without reference to human institutions.¹³ The Petrine injunction has two weaknesses which are illuminated by Leslie W. Dunbar's criticism of natural law renditions for failing to require that the disobedient must always take the burden of justifying his act. He objects to a special defect:

This comes about when the tradition asserts that the right of conscientious disobedience represents obedience to God rather than man; thus

¹² 283 U.S., 605, 633 (1931); Griswold, *op. cit.*, 728-738.

¹³ A leading statement of this view which rests its certainty in Christ is John C. Bennett, "The Place of Civil Disobedience," *Christianity and Crisis*, 27 (Dec. 25, 1967), 299-302. Religious institutions, it has been urged, have a duty to speak and act corporately on the great issues of conscience and not limit themselves to urging individual members to speak and act: Robert McAfee Brown, *et al.*, *Vietnam: Crisis of Conscience* (New York: Association Press, 1967), pp. 62-106, at 63.

"God justifies." That this borders on blasphemy is a truth which at least two millennia have conspired in suppressing. It is of a piece with the other too numerous manifestations of western civilization's pathetic repudiation of its own responsibility for its moral values. When we take the step of civil disobedience no presumptuous claim that "God justifies me" must be on our lips; only a plea that he do so. It is not God rather than man that we obey, but God rather than man that we seek to please, and therein lies a tremendous difference. We cannot explore this matter here, other than to note that what one offers to God cannot be logically evaluated.¹⁴

While Dunbar's larger finding is that mass black protest in the South was genuine disobedience and that it was justified, not by conscience or natural law, but by its political ends and non-violent means, his unhappiness with God's "validation" is an instructive reminder that some "conscience" justifications of disobedience raise the issue of self-certification through rationally unreachable claims, and they manipulate theological ideas. The first problem complicates the task of determining constructive rebels from their opposites. Dunbar offers an appealing solution: After the mystical disobedient offers up his act, he must appeal to men for secular judgment. Thereby two courts will have the benefit of review. On manipulating theological notions, one could say that this condition is difficult to avoid in an age when inner direction is widely respected or tolerated and those who believe in extra-human causes are experiencing revolutions. A more critical response is to suggest that Dunbar's point about pleasing instead of appealing to God implies a significant part of the "Obey God rather than man" directive that is often omitted—the possibility of God's punishment if the disobedient is acting contrary to divine will and law.¹⁵ In *Antigone* the heroine pitted her understanding of higher law against Creon's state command, but although she perished, in an ultimate sense the Gods vindicated her and punished him. Is it unfair to argue that when a disobedient invokes the Petrine doctrine, he ought to admit that he is in principle subject to the risk that God's penalties may be visited on him, not as testimony to state sovereignty,

¹⁴ "Sources of Political Rights," paper read to Southern Political Science Association, Durham, N.C., November 13, 1964. Mimeo., p. 7. Italics in the original.

¹⁵ There is also the possibility that the Devil rather than God is the source of inspiration. The perplexing implications of this option for actor and authorities were found at least as recently as John Brown of Harpers Ferry.

but because the law was more in tune with God's justice than his act? I think not. For without the corollary of God's justice, the "obey God rather than men" formula allows rule-breakers who invoke it to try to have the best of the subjective world in which they presumably believe. This is a questionable procedure in terms of limiting self-certification.¹⁶

A comment should be made here about recent developments in non-selective conscientious objection to compulsory military service which reveal a conflict between public policy and claimed moral impulse. Applying the protection of due process, but denying that Congress had violated the First Amendment by requiring belief in a Supreme Being, the Supreme Court in *U. S. v. Seeger* held that an objector, not an atheist, with sincere and meaningful beliefs parallel to the convictions of theists who is conscientiously opposed to participation in war in any form is qualified for exemption from combatant training and service.¹⁷ In the 1967 Selective Service Act, Congress responded to *Seeger* by removing the Supreme Being test; but, intending to exclude *Seeger*-type beliefs, it retained religious training and belief as the origin of conscientious objection and kept a ban on exemption based on essentially political, sociological, or philosophical views, or a personal moral code. In 1968 the Selective Service introduced a form to review *Seeger*-type beliefs. *Seeger* and the changes are only slight adjustments in the government's effort to determine sincerity and uphold equity. Together with the premises of the Universal Military Training and Service Act, they do not contribute to a common understanding of "conscience," and they raise questions about the government's right to define and apply tests about highest convictions.¹⁸

Political obedience and the issue of conscience are joined especially in controversies about se-

¹⁶ An example of the self-protecting formula is found in William Sloane Coffin, Jr.'s comments in Whittaker and Coffin, *op. cit.*, pp. 29-41.

¹⁷ 380 U.S., 163 (1965).

¹⁸ See Christopher H. Clancy and Jonathan A. Weiss, "The Conscientious Objector Exemption: Problems in Conceptual Clarity and Constitutional Considerations," *Maine Law Review*, 17 (1963), 143-160. If upheld, the Federal District Court ruling in *U. S. v. Sisson* (297 F. Supp. 902, 1969), which found that the 1967 law unconstitutionally discriminates against non-theists, religious or not, with profound moral convictions, will move the C. O. issue closer, either to the opening of Pandora's box or the victory of the inner light, depending on one's view. Ending compulsory military service would retire the question, unless there is another major war.

lective objection to military service, for which there is no statutory provision in the United States. For present purposes the importance of the controversies lies in their debate of the question: do convictions that a particular war is immoral and unjust meet the test of conscientious objection? The neo-conservative is likely to hold that selective objection is judgmental, i.e., "political," and should not be confused with traditional, i.e., "religious," conscientious objection which is a fundamental and rare phenomenon that government can and should legally tolerate. To this view sincere claims of selective objection to particular wars are worthy of respect. But they cannot be honored because they do not have the requisite "religious" quality and they clash with the idea that the government's will is paramount until changed by the representative machinery or public opinion.¹⁹ The libertarian, however, is apt to be sympathetic to a temporal faith interpretation of conscientiousness and willing to consider selective objection as potentially legitimate and not an indefensible challenge to national defense or democratic theory.²⁰ The difference between the two currents on the issue of selective objection focuses attention on how far each will permit legal exemptions from the requirements of citizenship to be extended in the name of conviction. Essentially the neo-conservative will allow non-performance that does not injure the rights of others or public safety, as with the constitutional refusal of Jehovah Witnesses to salute the flag, or that does not seriously affect a public mission, as in the instance of traditional conscientious objection to bearing arms at any time. In contrast to the neo-conservative, the libertarian will take greater risks in exempting non-confor-

¹⁹ Fortas, *op. cit.*, pp. 51-52.

²⁰ On selective objection to military service, the American Civil Liberties Union has equated the genuine objector's belief with conscience that is entitled to First Amendment protection whether or not he claims to be "religious." Although no testing formula was suggested, it has held that administrative scrutiny of the objector will detect the unconscientious and discourage this means to avoid the draft. *Civil Liberties* (March, 1966). Without plebiscites, church elites have endorsed selective objection. A statement upholding conscientious resistance to military service in particular wars received the approval of most American delegates to the Fourth (1968) Assembly of the World Council of Churches. The selective objection issue is a new and ambivalent question for historical critics of all wars. See American Friends Service Committee, *The Draft?* (New York: A.F.S.C., 1968), esp. Chapter 3, "From Witness to Resistance: The New C.O."

mists from public affirmation of national loyalty and performance of citizen duty. The former moves with court and legislative answers, the latter anticipates favorable responses from them, making their agreement on a conscience test of civil disobedience an unlikely prospect.

III. WHAT OBLIGATIONS DOES THE DISOBEDIENT ASSUME?

To leave the criterion of conscientious dissent suspended between two schools is not a happy condition. However, I will let it remain there until later to consider other evidence of good will, asking about civil disobedience what T. H. Green asked of the legal obligation to obey—what external things should be expected?²¹ For this purpose two standards are useful—the disobedient's willing acceptance of legal penalties and his use of "non-violent" means. For the rule-breaker to voluntarily submit to the legal consequences of his act is held, especially by neo-conservatives, to be a central proof of one's good faith and lack of criminal or revolutionary intentions.²² It is conceded that voluntary submission obliges the state to consider that the disobedient, not the rule, should be vindicated. For many neo-conservatives the test of full submission is for the disobedient to willingly plead guilty. Even though on moral and constitutional grounds he usually opposed his own formal guilt, the example of Martin Luther King, Jr. is valued by neo-conservatives because of his sacrificial style and testimony to the ideal of law expressed in this way: "And I submit that the individual who disobeys the law, whose conscience tells him it is unjust and who is willing to accept the penalty by staying in jail until that law is altered, is expressing at the moment the very highest respect for the law."²³

²¹ Thomas Hill Green, *Lectures on the Principles of Political Obligation* (London: Longmans, Green and Co., 1921), pp. 35–38.

²² Sidney Hook, *The Paradoxes of Freedom* (Berkeley and Los Angeles, University of California Press, 1967), pp. 116–118; Allen, *op. cit.*, 10–11; Fortas, *op. cit.*, p. 34. See also "A Declaration of Confidence in Columbia's Future," signed by faculty members of the Columbia Law School, *New York Times*, May 17, 1968, p. 41. Neo-conservatives honor Socrates as the Responsible Disobedient, holding that he drank the hemlock to testify to the state's integrity and the rule of law even as he believed that he had been unjustly accused and convicted. A variation is that the Gadfly's submission proved that he would let others disobey laws if they would assume the risk he had assumed: Charles Fried, "Moral Causation," *Harvard Law Review*, 77 (1964), 1258–1270, at 1269.

²³ Martin Luther King, Jr., "Love, Law and Civil

On the question of submission, libertarians are likely to refer to the varieties of legal situations under which civil disobedience might take place and to the possible weakening of protections for the accused through guilty pleas. The two patterns agree on minimum requirements that the disobedient should not become a fugitive from justice and after arrest should use conventional, legal means.

Protest circles have produced criticisms or rejections of the submission criterion, especially the neo-conservative version. Notable arguments hold that only obscurantist or craven men accept the requirement; by their courageous disobedience to reform democracy for philosophical reasons, a few men have prepaid society for any inconvenience they may have caused; acceptance of punishment encourages the state to keep and enforce the law or policy under attack; not to resist imprisonment or other penalty is to discredit the logic of disobedience; the law disobeyed is clearly unjust or unconstitutional so that acceptance of punishment is testimony to moral or legal falsehood. Howard Zinn's censure of neo-conservative submission covers some of these notions and adds others:

If a specific act of civil disobedience is a morally justifiable act of protest, then the jailing of those engaged in that act is immoral and should be opposed, contested to the very end. The protestor need be no more willing to accept the rule of punishment than to accept the rule he broke. There may be many times when protestors choose to go to jail, as a way of continuing their protest, as a way of reminding their countrymen of injustice. But that is different than the notion that they *must* go to jail as part of a rule connected with civil disobedience. The key point is that the spirit of protest should be maintained all the way, whether it is done by remaining in jail, or by evading it. To accept jail penitently as an accession to "the rules" is to switch suddenly to a spirit of subservience, to demean the seriousness of the protest.²⁴

A radicalization of protest idiom is clearly evident in many of these ideas. Conceivably they suggest an understanding of civil disobedience that calls into doubt the foundations of the democratic state, as known to date. But even

Disobedience," *New South*, 16 (1961), 3–11, at 8. It is less clear that King's adherence to the edifice of the law prevailed in his last few years when war policies and the maldistribution of wealth became his targets.

²⁴ Howard Zinn, *Disobedience and Disorder: Nine Fallacies on Law and Order* (New York: Vintage Books, 1968), pp. 120–121. Italics in the original.

granting the presence of revolutionary ideas, the disciplined observer should not be hasty to conclude that conspiracy is at work and the commonwealth is imperiled. On the grounds that civil disobedience is a relief valve for an uncertain mixture of insurgent thought and non-revolutionary opinion, some concessions to the criticisms of the submission test should be made. In particular, the neo-conservative insistence on a guilty plea should be eliminated. The result would be to make the submission criterion no more and no less than the requirement of a *legal* struggle *within* the state's jurisdiction. A search for "sanctuary" or flight to avoid prosecution would be evidence of something other than civil disobedience.

There is a close relationship between the submission test and the question of "non-violent" means. Christian Bay's encyclopedia article states that civil disobedience requires "carefully chosen and legitimate means," but holds that they do not have to be "non-violent."²⁵ Yet, neo-conservatives and institutional libertarians usually agree on the need for this criterion which is meant to certify the actor's acceptance of the legal structure and to help the act's efficacy by avoiding society's fear of violence and preventing counter-force. There are vexing problems of definition. Criteria-makers have come to no agreement as they face "non-violent" conduct ranging from Mennonite non-resistance through attempts to block a submarine launching to self-immolation. A main source of difficulty is the fact that efforts to expound on the moral or practical value of non-violence, efforts which have a permanent place in American social and intellectual history, have not completed the task of developing a theory of political institutions based on the norm.²⁶

The problems of defining and institution-

²⁵ Bay, *op. cit.*, p. 474.

²⁶ Commenting from within the peace movement on the division between the non-violent ethic and politics, A. J. Muste observed: "And since, in itself pacifism does not provide criteria for political discrimination, these criteria must be found elsewhere. In their search for sound criteria not all pacifists mine the same political quarry." Quoted in James A. Finn, *Protest: Pacifism and Politics* (New York: Random House, 1968), p. 200. Pacifist and related writings from William Penn to Bayard Rustin are collected in Staughton Lynd (ed.), *Non-violence in America* (Indianapolis: Bobbs Merrill, 1966). Gandhian resistance to reform the law is urged in Harris Wofford, Jr., "Non-Violence and The Law," *Journal of Religious Thought*, 15 (1957), 25-36. *Satyagraha* is appraised in my "Toward a Reassessment of Gandhi's Political Thought," *Western Political Quarterly*, 16 (1963), 99-108.

alizing "non-violence" imply a discussion of its opposite. The key question here is who may use violence legitimately? Drawing on traditional political obligation, the neo-conservative has answered with a moderate but explicit doctrine of state sovereignty. The libertarian is not greatly different, holding that the state alone has a legitimate monopoly over violence. While one could reasonably argue that the state has only a *de facto* and not a *de jure* monopoly over violence until the principle of consent is more fully realized, I see no viable alternative to retaining the neo-conservative, and by and large the libertarian insistence, that violence is rightly employed only by legal authorities who through legislative and judicial means determine what is and what is not anti-social behavior. In the crucible, public executives and their agents may equate illegality with violence and anarchism and act repressively on the confusion. The disobedient can help to prevent these defects by his peaceful conduct. More explicitly, the disobedient should be governed by the moral conviction that he is a witness to charity that he finds lacking in the state, obligating him to abstain from physical injury to persons and things. To hold that there ought to be a distinction between the lesser evil of violence to things and the greater evil of injury to persons is to invite a further debate about arson and theft, a process that will undermine the original ethic that was invoked.²⁷ "No contusions or breakage" may have little claim as a sophisticated rule for civil disobedience, but it is readily comprehensible and testifies to a prime democratic value, peaceful change.

A discussion of civil disobedience as potential revolution is suggested by the last criterion to be examined, a proximate relation between the violated rule and the cause for grievance. The neo-conservative tendency interprets the standard as insisting on a cause and effect bond. It is unsettled about any other understanding. Francis A. Allen writes:

But dilemmas arise when the object of protest is a condition that does not result from the enforcement of any particular law or from the conduct of any readily identifiable person or group, but

²⁷ Contrast Zinn, *op. cit.*, p. 46. For a dualistic thesis that when avenues for peaceful change have been closed, exhausted or found ineffective, violence is needed as much as peaceful civil disobedience as a mechanism to advance democratic values, subject to the government's enforcement of order and its removal of the causes of the outbursts, see Ralph W. Conant, "Rioting, Insurrection and Civil Disobedience," *The American Scholar*, 37 (1968), 420-433, at 433.

which, on the contrary is the consequence of a whole complex of social, cultural, and historical factors . . . Direct action that assumes the characteristics of a secondary or tertiary boycott is not well calculated to a call for the moral response from the larger community upon which the classic theory of civil disobedience largely relies. Moreover, such programs contain a large and unmistakable ingredient of irrationality . . . Such forms of protest, whatever the provocations that induced them, represent a retreat from reason and ultimately threaten the nonviolent character of the present movement.²⁸

Although Allen's illustration of a non-proximate condition is Negro disobedience for the proclaimed goal of increased economic opportunities, his comment is representative of neo-conservative concern about civil disobedience launched recently against national military policies. The libertarian tendency, which is equally devoted to rationality and peaceful means, does not share the neo-conservative objections to secondary and thus "political" relationships. To this view, Thoreau's refusal to pay his poll tax to draw attention to his objections to the Mexican War and slavery had no logical defects. Similarly, it is unlikely to fault the logic of the 1967 March on the Pentagon to publicize and alter Vietnam policies, however the means and the grievance are themselves judged.²⁹ Unlike the neo-conservative pattern, the libertarian outlook construes broadly the relevancy of a disobedient act for the rule broken. Although not all libertarians may object to *U. S. v. O'Brien's* denial of immunity for acts of "symbolic speech" which protested the wisdom of distant governmental decisions by challenging their legal armor,³⁰ the tendency they represent is fundamentally tolerant about the secondary character of rule-breaking which aims at the Leviathan through one of its peripheral laws.

Civil disobedience should not have to meet

the neo-conservative exclusion of a secondary relationship between the violated law and the basic grievance. The breaking of a marginal, innocuous statute to communicate protest about a legally distant wrong is either individual witnessing or interest group behavior that a self-confident democracy can withstand without serious injury, especially in view of the public obloquy visited by majority opinion on non-conformists. If civil disobedience is restricted to the testing of rules believed unjust or unconstitutional—as the neo-conservative test of proximate relation between object and complaint requires—civil disobedience would be confined to an essentially quasi-legal function when it may have a legitimate, politicized role as a "Question Time" for the majority will transcribed through the existing representative system. Under the heading of proximate relationship, it would seem sufficient to ask and expect an affirmative answer to the question, "Is the protest directed toward a specific need or wrong, clearly identified among the protesters; and has care been exercised to communicate its nature to bystanders and opponents?"³¹ An "immoral" war or "retrogressive" tax policy would seem to be sufficiently specific; "poverty" or "racism" would probably be too general to qualify.

It would be premature to conclude that the norms of concreteness and honest publicity are enough to convince those who ask for a proximate relationship between the infraction and the grievance that the prospect of revolution is thereby significantly lessened. Indeed, the question whether revolution is or is not immediately beyond the threshold of civil disobedience can be raised at several turns in the discussion of standards for acceptable rule-breaking. Opinion falls between two limits. One is identifiable with conservatism and holds that civil disobedience is incipient rebellion.³² The other is on the outer frontier of institutional libertarianism and asks that civil disobedience as "non-violent revolution" should be given legal immunity.³³ Although the bulk of the commentators are willing to avoid bracketing civil disobedience with revolution, neo-conservatives are apt to entertain and answer forebodingly the question: "Is there an attack on the system?" This phenomenon implies their general misgiving about allowing any rule-breaking in an operating, if imperfect, pluralist democracy. Libertarians are less

²⁸ Allen, *op. cit.*, 12–13.

²⁹ The preparations and conduct of the October, 1967 demonstrations at the Pentagon had factors of interest to the student of civil disobedience. One participant-observer finds the criteria of advance notice, "non-violence," and appeal to the public conscience. He also suggests as the claim that the government was obliged to negotiate on how it would be disobeyed. See Norman Mailer, *The Armies of the Night* (New York: New American Library, 1968). A situational description of the Pentagon events as a mixture of Gandhian and insurgency tactics is reported in *Liberation*, 12 (November, 1967) 3–7 (David Dellinger), 26–28 (Arthur Waskow).

³³ Freeman, *op. cit.*, pp. 5–6.

fearful about civil disobedience being or becoming an attempt to displace the current regime. They depend on the standards of disclosure and "non-violence" to build a wall around the disobedient to tell him from the insurgent.

The neo-conservative fear that rebellion is inherent in rule-breaking is especially troublesome for the task of establishing criteria for civil disobedience. If the concern becomes overriding there is a risk that under its weight other criteria will fall. To avoid this contingency the discerning student will have to do one of two things. Either he will try to work out his own set of answers to show that there is no insuperable logical difficulty in viewing civil disobedience as a non-revolutionary question.³⁴ The other option is for him to rely on a belief that in a democratic context "principled" lawbreaking is worthy of ethical examination regardless of the risk that it may produce, intentionally or otherwise, the reality of political violence. I would recommend the second alternative, and support it with the addition of two widely-proposed criteria—the exhaustion of legal remedies before disobedience is undertaken and demonstrated care for substantial rights of others, e.g., First Amendment rights. The former helps to maintain the validity of redress procedures, which if discredited by non-use, may not provide adequate justice for anyone. The latter requires the disobedient to show non-ideological evidence of the humanism which he has proclaimed as his *weltanschauung*.

Civil disobedience therefore emerges as rule-breaking which meets certain standards. Assuming the act to be deliberate, it should be an articulated, public deed, aimed at a specific wrong and conducted peacefully with concern for others inside the state's jurisdiction after completing legal, remedial action. Selective borrowing from neo-conservative and libertarian norms opens the way to a discussion of whether there are significant tasks in democratic theory which might be performed through civil disobedience. Before that enterprise is undertaken some settlement must be made of the test of conscientious dissent.³⁵

IV. WHAT IS "CONSCIENTIOUSNESS"?

Because of the centrality of "conscientiousness" for many definitions of civil disobedience, it deserves the most careful evaluation as a possible source for justification of rule-break-

ing in a democratic context. The standard is open to two defective understandings. On the neo-conservative side there is the risk of sacrificing the possibly creative voice to the rule of law. Among libertarians there is the chance of the absolutism of individual conscience overcoming civic virtue and order. Even if a balance were struck between the tendencies, application would be a basic problem of the test. "There cannot be," Franz Neumann wrote, "a universally valid statement telling us when man's conscience may legitimately absolve him from obedience to the laws of the state."³⁶ Neumann may have been premature in closing the door on scientific determination of conscientiousness, but his comment recalls the near inscrutability of the inner light and the extreme difficulty of giving it consensual recognition. An amendment may be in order to require an affirmative response from the "conscience" of others as evidence of the disobedient's own credentials. The implications of this qualification include the transference of the testing process from the actor to his audience. This amendment has the drawbacks of opening the question of how significant followership or its absence is to judging the disobedient and recalling Rousseau's general will as a "conscience" for the whole community. The former leads to a discourse on effective leadership, not valid rule-breaking; and the latter leads to controversies about the meanings of the *Social Contract* that are unsettled two centuries after its publication. Because of these problems, the amendment does not offer a reliable way to determine the individual's merit.

Given the diversity of meanings and the many questions about recognition and application which spring up around "conscientiousness"

1945 London Agreement on moral choice in the face of immoral state orders tends to assign the principles to a category of inner judgment. [The Agreement is in *Journal of International Law*, 39 (1945), Supp., 257-264.] It is debatable whether that judgment is "only" entitled to decide for disobedience or is *obligated* to so decide. The latter interpretation has been influential in popular resistance ideas. See Benjamin Spock, "Vietnam and Civil Disobedience," *The Humanist*, 28 (1968), 3-7, at 6. This stand was also adopted by Capt. Howard B. Levy in his military trial. *United States v. Levy*, CM416463 (Army Bd. of Rev. Aug. 29, 1968), *et cetera*. His view was an interpretation of Army Field Manual 27-10, *The Law of Land Warfare* (1965). Yet, this document, which outlines legal responsibility for war crimes, stipulates neither entitlement nor obligation to disobey.

³⁶Franz L. Neuman, *The Democratic and the Authoritarian State* (Glencoe: The Free Press, 1957), p. 158.

³⁴For this position, see Richard Wasserstrom, "Disobeying the Law," *The Journal of Philosophy*, 58 (1961), 641-653.

³⁵Appeals to Nuremberg principles to justify disobedience have a close affinity to conscientious dissent. The focus of the relevant passages of the

as a guide to identifying disobedience which a more perfect democracy would permit, one is left with the choice of either eliminating the criterion from consideration as Sidney Hook has done in the name of secular humanism³⁷ or relying on an interdependency of the disobedient and the state that will salvage some acts of conscience from its power.³⁸ Recognizing significant problems in either direction that require further exploration, I would choose the second course, endorsing Professor Dworkin's thesis that the regime's discretionary authority not to prosecute is the least unsatisfactory device to recognize the existence and condone the public results of the dictates of private conscience.³⁹ Some will object that the solution leaves conscience the prisoner of state theory—any state theory. The complaint has reasonable grounds, but it overestimates the achievements of those who wish to realize the ideal in which no man is ever forced to act in a manner contrary to his conscience.⁴⁰ Another objection is that anti-pop-

³⁷ Hook contends that "conscience" is a dangerous guide for principled action, which if accepted, opens the way for totalitarians along with peace workers. See especially *Paradoxes of Freedom*, Chapter 3. His thesis is overly dependent on viewing conscience as a basis for *political theory*, whereas many who claim its guidance are no more or less than moralists who may be correct or mistaken in their judgments but who seldom offer political theories. I agree with Hook's evaluation that individual conscience alone is an untrustworthy basis for consent to law. Contrast Harold J. Laski, *Authority in the Modern State* (New Haven: Yale University Press, 1927), pp. 32-47. Recent controversies have caused constitutional libertarians to attempt to combine political respect for and legal skepticism about disobedience based on highest principle: "The American Civil Liberties Union Statement on Civil Disobedience," February 1, 1969, mimeo.

³⁸ A third way is possible if one believes that the entire question of civil disobedience is based on what may be owed to others through shared values and associations. For this approach, which differs from mine, see Walzer, *op. cit.*, *passim*.

³⁹ Ronald Dworkin, "On Not Prosecuting Civil Disobedience," *New York Review of Books*, 10 (1968), 14-21.

⁴⁰ The ideal has received notable support from the Roman Catholic Church in Vatican Council II's "Declaration on Religious Freedom." A state, even one that is democratic, can make a declaration of this kind only at its peril. No longer a state, but still a government, the Church faces numerous dilemmas in combining the "no-coercion-toward-conscience-even-when-wrong" ideal with Apostolic and Papal theories. As discussed in the Encyclical

ulist favoritism is practiced through forgiveness of "principled" rule-breaking, an indulgence not to be extended to the "generality" of men—a term used by Judge Charles Wyzanski, Jr. when he accepted a man's refusal on non-theistic, conscientious grounds to be inducted for combat service in Vietnam.⁴¹ The criticism is especially difficult to answer because it exposes the elitist character of civil disobedience to which so little attention has been paid.⁴²

The main problem, however, is to avoid two extremes. To ignore individual conscience as a guide to state response to disobedience is an undesirable concession to legal positivism and philosophical relativism. To elevate conscience as a self-determined yardstick is an unwelcome step toward political atomism. A balance is possible when the non-prosecution option is accepted. It depends on the forbearing character of the American state. Less than optimal, the quality ought to be refined and strengthened; but its present condition is intrinsically valuable to help recognize and respect the dictates of private conscience.

V. CIVIL DISOBEDIENCE AND DEMOCRATIC GOVERNMENT

With the completion of the foregoing sketch of criteria for civil disobedience that reveals certain political ethics and distinguishes it from political revolution and conventional dissent, a provisional response can now be made to the question whether resistance of this kind contributes a service to American democratic thought. A subsidiary issue deals with the possible defects of the current. From the standpoint of American political obligation the area that is most pertinent is the Lockean dispensation. According to this theory, primordial consent established a political society out of which a state emerged, probably through a second contract, as Althusius had argued more clearly than Locke. In any event, original consent entitles the state to a basic loyalty. The citizens retain a portion of their pre-civil authority to self-government through the persistence of inviolable rights and a representative system operating through ma-

Humane Vitae, the birth control issue is one controversy in which the difficulties are revealed. For the American Catholic Bishop's 1968 statement on the issue in which on net balance conscience "as a law unto itself" is subordinated to the Church's teaching authority, see "Human Life in Our Day," *Catholic Mind*, 66 (1968), 1-28.

⁴¹ *U. S. v. Sisson*, 297 F. Supp. 902 (1969).

⁴² For the caution that in a democratic context civil disobedience is minority rule, see John H. Schaar, *Loyalty in America* (Berkeley: University of California Press, 1957), p. 52.

majority will. It is the delegational machinery which normally keeps the state accountable to its citizens who give a few men a fiduciary power to govern. *In extremo*, citizens may legitimately use violence to remake the state when it violates the terms of its mandate. Minority discontent is no proof that the mandate is broken. Only majority sanction can legitimize the claim. Private conscience is recognized by the Lockean tradition, but it is not the basis for a right to rule-breaking.⁴³

The Lockean view of obedience and dissent has two main weaknesses. The fiction of voluntary membership in a political community is at best a literary metaphor or at worst a device for assuring the state consensualist value under the guise of a myth. For civil disobedience a result of the fault is to assign an awesome burden of moral justification for any illegal act to the disobedient, even when the law violated is patently inequitable. The civil disobedient learns what other law-breakers have found, that he faces not only the immediate legal network, but a surrogate to which presumably he had consented in a primeval cavern. Not all evidence of this problem in American political thought lies with Lockean theory, Hobbes' single contract and Leviathan having made themselves felt despite the stronger current of the former. Still, Lockean explanation about the genesis of political obligation gives the state an unearned title to expect and exact obedience even before the stuff of the second contract, the representative system, comes into focus.

The second weakness of Lockean theory lies in its anti-individualist and conformist bent that contrasts with Locke's natural rights and social ideas. The bias shows in his insistence that majority will is needed to begin the valid overthrow of unjust rulers and in the politically undernourished place given to conscience. The influence of these beliefs on any kind of dissent is especially revealed in a condition Robert A. Dahl calls a "J-Curve" situation where the bulk of the citizens agree on many political issues. Relating this condition to political philosophy, he writes:

A vast number of questions that might be of abstract interest to philosophers, moralists, theologians, or others who specialize in posing difficult and troublesome questions are, in any stable political system, irrelevant to politics because nearly everyone is agreed and no one can stir up much of a controversy. If a controversy does arise because of the persistence of a tiny dissenting minor-

⁴³ A similar understanding of Lockean obligation and dissent is Harry Prosch, "Toward An Ethics of Civil Disobedience," *Ethics*, 77 (1967), 176-191, at 178-179.

ity, in a republic the chances are overwhelming; that it will soon be settled in a way that corresponds with the view of the preponderant majority.⁴⁴

The condition described is precisely the kind where there *ought* to be an opportunity to ask troublesome questions and to demand answers from public authorities that are innovative. In an unstable system many voices are heard and the democratic state is apt to change its policies and laws. Sympathetic to Dahl's "others," I detect a need to keep open the possibility of challenges to laws and policies, regardless of the opinion of the "preponderant majority." That this can be allowed in terms of Lockean understandings of dissent is doubtful.

It would be unwise to conclude that because Lockean ideas about obedience and dissent have drawbacks their framework should be discarded. Not only are alternatives, e.g., Hobbesian or Marcusian theories, antithetical to such democratic values as privacy and self-fulfillment, but the Lockean tradition has developed intellectual commitments to civil liberties and participatory government that are crucial for the protection and advancement of human rights and regime accountability. What might be done profitably is to adopt an idea of "justice" to link, without confusing, the rulers and the governed. Skeptical of founding "justice" on the mythical soil of contract, I agree, nonetheless, that some understanding of the notion might overcome the weaknesses of Lockean theory.⁴⁵ Understood as a trans-political, moral ideal rooted in the nature and destiny of man, "justice" partakes of T. H. Green's "common good,"⁴⁶ despite the reservations that can be introduced about his statism and unclear teleology. For civil disobedience an eclectic conception of "justice" which is not mortgaged to primordial contract or state "ends" provides a shared field for presumption about obedience to compete with disciplined challenges. The competition is on terms which do not preordain the outcome, although they unapologetically respect systemic legitimacy.

To proceed this far is to go beyond the mat-

⁴⁴ Robert A. Dahl, *Pluralist Democracy in the United States: Conflict and Consent* (Chicago: Rand McNally and Co., 1967), pp. 272-273.

⁴⁵ Justice and contract are joined in John Rawls, "The Justification of Civil Disobedience," in *Civil Disobedience: Theory and Practice*, Hugo Adam Bedau, ed. (New York: Pegasus, 1969), pp. 240-255.

⁴⁶ On Green's "common good," suggesting that its social context is true but because of faulty use of words he failed to distinguish different goods, see Plamenatz, *op. cit.*, pp. 62-81.

ter of imperfections in the predominant stream of American democratic thought and to enter a discussion of whether civil disobedience is well qualified to guard and further democratic ideals. On this question, Bay is a prominent spokesman for the affirmative. He suggests that civil disobedience can be a new and vital way to realize human values no longer served by majoritarianism because of the inroads of modern knowledge and the distortion of the rule of law and representative machinery into ultimate goods. Visualizing a non-elitist polity with a reallocation of power that lessens poverty and violence and expands human rights, he wishes to substitute for the classic justification of democracy through political obligation an ethic of individual responsibility for the likely results of one's political conduct, including obedience to law.⁴⁷ This proposal is valuable to the degree that it reminds conservative and neo-conservatives of Bracton's dictum that the king is *sub deo et lege*, and how in our time the rule of law means that "the law itself is based on respect for the supreme value of human personality."⁴⁸ Bay's reliance on individual rectitude is more controversial, for although he denies that Thoreau is the model for civil disobedience, his ideas align with the New Englander's thesis that the free man defines his own responsibility.⁴⁹ The realization of Bay's goals, which others seek, requires limits. I contend that the limits mean that the free and responsible man operates within a community that develops his rectitude and the state's. Is this stand close to that of David Spitz who refers to the foundation of the problem of political obligation in the Aristotelian question about whether a good man can always be a good citizen? He argues that it is possible to be true to both through the loyalty of

the citizen to the principles of democracy, despite the presence of unjust laws. In the last analysis, Spitz relies on the goodness and honesty of man operating from moral principles to judge rationally the likely results of his disobedience, and to bring his pressure to bear on the state to try to produce a greater benefit than what is apt to come from obedience.⁵⁰ As an amendment, I would suggest that, in addition to combining the good man's work for the development of the state, the state must be allowed to help him. This is not testimony to the sanctity of the state.⁵¹ As in classical liberalism, he will control the moral balance, but there is or there ought to be a mutuality between man and the state.⁵² For state power can help to liberate him from deprivations. Existentialism to the contrary, he cannot perform the task alone.

Applied to responsible civil disobedience, mutuality does not mean that legal immunity ought to be extended to it. This would be to legitimize and normalize civil protest into a formal, remedial institution that the democratic system already provides in other ways. Routinization would also destroy the logic and spontaneity of disobedience. Yet, civil disobedience can aid, as it has in the past, the selective incorporation into civil rights and liberties of public speech and behavior previously denied to citizens. While some attempts fail and may deserve to fail in such marshy areas of criminal law as conspiracy and trespass, disobedience of the law, as the neo-conservative admits, is sometimes a useful tool to expand the arena of liberty. Moreover, responsible civil disobedience can continue to aid social changes that are beyond the capacity or will of representative institutions. Although civil rights disobedience within individual states had their approval, this is a basic frontier neo-conservatives would rather not pass. They can be answered with the reply that civil rule-breaking can energize the political system to take additional steps to advance social progress, provided it is understood that the criteria suggested in this paper or similar tests

⁴⁷ Bay, *op. cit.*, pp. 484-485. The populism inherent in Bay's ideas is more apparent than real, for he would trade the elitism behind liberal democracy for a new elitism of radicals who would produce bold policies.

are developed as insurance that principled disobedience is not a threat to the constitutional order, but an effort to retain it because of its demonstrated values.⁵³

Those who believe that the representative model, operating fundamentally by "majority" will, coalition leadership and a developing system of rights and liberties, is the best arrangement to be expected in an imperfect world, are unlikely to invite civil disobedience into the house of Madison and Lincoln. Essentially, this is the neo-conservative current. Some, but perhaps not all, libertarians are open to the prospect of legitimizing civil disobedience as a genuinely democratic method. They believe, and I would agree, that civil disobedience can provide a theoretical service in a democracy through the reform of the delegational pyramid. For without contending that Rousseau's city-state ought to be the paradigm for democracy, I suggest that the representative structure which welfare democracy inherited from last century's liberalism and improved in this century has not been so administratively effective or so politically virtuous that it cannot be improved by new arrangements for combining obedience and consent. To experiment is a risk for democratic political obligation. But is there not an equally serious risk if stability is valued ahead of the expansion of accountability?⁵⁴ Distinguished from the use of force to impose decisions and from the existing regime of rights and liberties, disciplined civil disobedience is possibly a creative way to ask the citizens of the state if they are satisfied with other aspects of the delegational model that has served well but which may not

have produced the most equitable and efficient allocation of power and resources to deal with emergent disaffection and unmet needs in the national polity.

But how *necessary* is civil disobedience, given the availability of many legal forms of political opposition and reform? To face this question is to appeal for empirical studies of the benefits or costs of civil disobedience undertaken in our time, measured against the reasonably well-known strengths and drawbacks of conventional forms of political opposition. Recent studies of violence in the United States are of no great value because they have proceeded almost without the aid of ethical distinctions about various kinds of disorder.⁵⁵ The distinctions, as I have tried to show, can be made. The task is to use some set to isolate *civil* disobedience from other forms of unconventional dissent and after empirical analysis to declare whether there is a *need* for this special form of opposition in terms other than the ones that are used frequently to justify it.

Meanwhile, three compelling reasons support the incorporation into American democratic philosophy of *civil* disobedience. As a buffer between civil liberties and rights, and direct action and Communardist ideas, having kinship with both, it provides a testing zone for challenges to representative democracy without complete submission to either established or new rules of the game. Civil disobedience takes soundings for the operative formulas of democracy, not the least of which is how to probe for a conception of justice held by dissidents and state alike. Finally the phenomenon is an educational strategy to rethink persistent questions of political obligation. For all three reasons incentives are supplied, not only by intellectual curiosity, but also by the power, merits and inadequacies of discontent itself.

⁵⁵ A minority of the Eisenhower Commission on Violence cited ethical criteria in its dissent from the majority's faulting of civil disobedience: n. 4, *supra*.

⁵⁴ Political obligation rests on a narrow interpretation of order and stability in Charles S. Hyman with Charles E. Gilbert, *Popular Government in America: Foundations and Principles* (New York: Atherton Press, 1968), 274-275.

RATIONAL BEHAVIOR IN POLITICS: EVIDENCE FROM A THREE PERSON GAME*

WILLIAM H. RIKER
University of Rochester

AND

WILLIAM JAMES ZAVOINA
Florida State University

I. THE CONCEPT OF "RATIONAL BEHAVIOR"

A fundamental controversy in political theory from ancient times until the present concerns the rationality of political actors, what it is, if it exists at all, and whether or not humans display it in politics. Many political scientists are impatient with this controversy because it remains open after so much (apparently futile) discussion. But they ought not be. The problem of rationality is necessarily imbedded in even the simplest kinds of political research, where, if overlooked, it can occasion misinterpretation and even outright error.

Suppose, for example, in an investigation of legislators one uses the notion of party loyalty as an independent variable to explain behavior. This notion seems simple and straightforward enough and not, therefore, likely to involve one in philosophical controversy. But in fact party loyalty can be interpreted in a variety of ways and the choice among them necessarily involves a choice on one side of the controversy over rationality. Loyalty can be thought of, for example, as a truly independent variable, as a product of political socialization, as an expression of affect, and hence as an essentially irrational motive. On the other hand, it may be thought of as itself dependent on bargains rationally satisfying the preferences of legislators. Such bargains may be either short term or long term so that a legislator's manifest party loyalty may result from a series of advantageous bargains with party leaders on particular bills or from an implied bargain with them on career advantage. But, in either case, if party loyalty is the product of bargains, it is something quite different from loyalty based on affect. And this difference in turn makes a profound difference in interpreting the behavior of legislators for a loyalty based on bargains is subject to strains and stresses not found in a loyalty based on affect.

* The work on this essay was undertaken with the support of a grant from the National Science Foundation. We thank the Foundation very much.

Which kind of loyalty exists thus makes a difference in the prediction of behavior and, furthermore, the quality of prediction thus depends on a decision in the philosophical controversy.

This controversy is pervasive in political science. The controversy implicit in the notion of party loyalty as applied to legislators is equally implicit in the notion as applied to voters, and, beyond that, is implicit in such notions as class interest, national interest, alliance membership, etc., when used as variables to explain the behavior of men or nations. It is not possible, therefore, to avoid the controversy in serious political research.

Pervasive as this controversy is, political science has made remarkably little effort to resolve it for its own concerns. Although the present form of the question is: "Are men rational in making decisions?," the greater portion of the philosophizing about political rationality has been in terms of the issue as it was raised by Plato, the Stoics, and the philosophers (e.g. Hobbes and Rousseau) and lawyers (e.g. Grotius and Blackstone) of early modern times. These writers saw no issue in whether or not men are rational. All assumed men are. Rather they debated the nature of this rationality: do men, in behaving rationally, seek to maximize self-interest or to maximize some external goal as set forth for them in divine law, natural law, or the general will? An illustration of the regressive quality of much of current political philosophy is the recent volume of *Nomos* on rationality in which almost all the discussion is in these anachronistic terms.¹

But while political philosophers keep on debating the issues raised by Hobbes and Rousseau, the controversy has changed. Now, as a result of philosophical and scientific inquiry in

¹ Carl J. Friedrich (ed.), *Nomos VII: Rational Decision* (New York: Atherton Press, 1964). There is, however, one work which blends the old and the new very nicely, Paul Diesing, *Reason in Society* (Urbana: University of Illinois Press, 1962).

the two intervening centuries, the question has become: "When faced with the necessity of decision among several alternatives, do men order their preferences among them and choose that alternative which maximizes their utility?" where, of course, utility is understood as a measure of ordered preferences. Or, assuming a general affirmative to that question: "On the basis of what goals do men order their preferences?"² Around these questions today there are a variety of philosophical positions, among the most important of which are:

1. *Those which assert that choosers maximize utility.* Although the contemporary intellectual world is often described as anti-rationalist, the science of economics, which is the most practically successful and intellectually elegant of the social studies, is built entirely on the premise of rational behavior. In an anti-rationalist world, it has kept alive one side of the older rationalism (i.e., the radical individualism and nominalism of Hobbes and Bentham); but it has so refined the problem that its genetic resemblance to its ancestor is only barely visible. Its picture of the rational calculus is that men order preferences according to their tastes, although they impose on the ordering some elementary logical requirements of coherence and consistency. Once ordered, men then behave in situations involving risky choice as if they were maximizing expected utility, where utility is a numerical measure on preference orders. If one assumes that tastes are given and inscrutable, then the will appears as arbiter of taste, and reason appears as the efficient servant of the will. In such a view of rationality, which we call procedural, men are invariably rational. The only way an observer can discover the inscrutable goals is by observing choices among alternatives. From the choice, and from the assumption that the chooser maximized his utility, the observer infers the subject's goals. Although this theory is tautological, it does assert something testable, namely that men behave as if they were rational calculators. In many economic and political applications, however, one assumes further that a particular goal is appropriate for all men in the particular circumstances of the choice. In this view of rationality, which we call substantive, men as producers are said to maximize profit, men as consumers are said to minimize cost, etc. This theory, since it is not tautological, allows tests of assertions about calculation but unfortunately it also involves the scientist in attributing goals

and necessarily, therefore, involves the chance of error from this source. Both versions of rationality, regardless of whether or not a goal is postulated, do, however, assume that men are rational calculators, which is what other, subsequently listed, theories do not assume.

2. *Those which assert choosers choose by habit and discovery rather than by analysis of preference.* Learning theory, which derives from that great nineteenth century realization that man is part of the animal kingdom and from the great twentieth century realization that laboratory animals (and thence man) could be taught to respond positively to stimuli associated with rewards, offers a totally different picture of choice from that implied in the question as we have stated it. In learning theory, choices are said to occur as a result of rewards and punishments administered for previous behavior. If a subject—man or rat—chooses in random exploration an alternative that results in a reward, then on subsequent presentation with the same alternatives he chooses that which led to the reward. The chooser, of course, has preferences, even ordered preferences. And in this sense learning theory is like the theory of rationality in that men are said to choose what is preferred over what is not preferred. But the theories differ in that, in learning theory, the choice results not from a calculus but from the recall of previous consequences. Naturally, there is no maximization of utility here, merely the satisfaction of some desires, which are not necessarily the most pressing ones.

3. *Those which assert that choosers do not maximize utility.* Here the most well-known position is the psychoanalytic, which ultimately derives from the exaltation of will against reason in such writers as Schopenhauer and Nietzsche. As against the rationalistic view that reason is the servant of the will, here will and reason are at war. Not unexpectedly, therefore, the very notion of ordering preferences is rejected as an unrealistic description of behavior. Instead, choice is interpreted as the product of sexual forces modified by rationalizing and socializing counter forces in an essentially disorderly way. To the psychoanalyst, therefore, the answer to the question of whether or not men choose so as to maximize utility is not simply "no" but rather that men are likely to choose exactly oppositely. Somewhat similar to the psychoanalytic position in this respect is the theory of cognitive dissonance. According to this notion, the relation of choice to preference as we stated it in our initial question is a reversal of nature. Instead of choosing so as to maximize utility (a measure of preference), men are said to construct preferences in order to rationalize

² This question, while superficially resembling the old one, differs in the expectation that goals be empirically investigated rather than attributed in arm-chair dicta.

choice. What comes first is choice based on some wholly unrationalized affect such as identification or Oedipal urges or what not. If this choice is challenged, then preferences are ordered to rationalize it. Hence choice is first and preference second, an outright reversal from the theory of rational behavior. Naturally, the theory of cognitive dissonance, like psychoanalysis, has no place for choice that maximizes utility.

Such is the confrontation of rationalism and anti-rationalism as it appears today in social science. A remarkable feature of the dispute is that each of the viewpoints, while supposedly universal, is actually quite closely linked to the behavior studied. Thus the main contemporary exponents of the model of calculating man are economists, who study behavior in the market. The main exponents of the model of choice by habit and discovery are learning theorists, who study behavior in the rat-maze and the class room. The main exponents of the model of choice by reason of sexual drives are psychoanalysts, who study behavior in dreams and fantasy-making. And the notion of cognitive dissonance with its emphasis on choice as against preference was first applied in a study of religious behavior. Each theory, however, seems to work fairly well when applied to the behavior for which it was created and to appear insufficient when applied to behavior generally.

This fact creates a difficult problem for political theory. If, as we have argued, the quality of political research depends in part on the position the researcher takes on the question of rationality, he must choose among the theories in this spectrum. But to do so he needs to make some decision on the kind of behavior he is studying. Is political behavior closer to behavior in the market or to behavior in fantasy? If we could answer this question with assurance, we could adopt wholesale a theory from another discipline. But assuming politics is, in Easton's words, the authoritative allocation of values, it is uncertain whether utility theory or something quite different applies. So far as politics is allocation, it seems analogous to economics, which is often defined as the study of the allocation of scarce resources. So far as politics is authoritative, however, it seems analogous to the world where learning theory applies, with its emphasis on rewards and punishments or even to the dark and vicious world of fantasy where power is thinly-veiled sadism and authority is power with yet another veil.

Given this ambiguous nature of politics, it seems desirable, therefore, to investigate action in a political setting in order to determine in some preliminary way, at least, what kind of be-

havior is political behavior and hence what kind of theory about rationality is appropriate for political science. That is, we need to look at characteristically political behavior with a view toward determining what kind of theory of rationality fits it best.

To a small degree, such work has been done. A generation ago Harold Lasswell studied several politicians psychoanalytically, though the relation between their behavior on the couch and their behavior in political office was never made clear.³ Furthermore, Lasswell wrote as a proponent of a particular theory rather than as an evaluator of competing theories. More recently Robert Lane has studied by depth interviews the thought processes on political issues of a few ordinary citizens, although again the relation of their attitudes to their political actions was not investigated.⁴ Much of the early survey research on voting by Paul Lazarsfeld and, especially, Bernard Berelson was interpreted by its authors in anti-rationalist terms, thereby setting something of a style for subsequent writers; but V. O. Key responded in *The Responsible Electorate* with what reads very much like an interpretation in terms of utility theory of the whole range of data from survey research about voting.⁵ Recently Peter Ordeshook and the senior author attempted to interpret data on the decision to vote so that behavior followed directly from the assumptions of utility theory, although one term of the equation looks very much as if it originated in learning theory.⁶ Although Herbert Simon is responsible for introducing political scientists to learning theory (through his notion of "satisficing" as contrasted with "maximizing"), he never really used it to investigate political behavior. Others, however, have, especially Charles Lindblom, with his notion of incrementalism which is derived from Simon's "satisficing" and which is offered as a general rule of political decision.⁷ And

⁷ David Braybrooke and Charles Lindblom, *Strategy of Decision* (Glencoe: The Free Press, 1963).

Richard Fenno and Davis, Dempster, and Wildavsky have applied something of this notion to explain appropriations decisions.⁸ Unfortunately this short survey mentions most of the important work that has been done. And except for the work by Key none of it has been undertaken in a mood of evaluation and for the purpose of offering an answer to the question of what kind of theory about rationality is appropriate for political science. Clearly more diverse investigations than these are desirable in order to clarify this question. In this essay, therefore, we offer a report on one such investigation which suggests that political behavior is the kind of behavior for which utility theory is appropriate.

II. THE GAME SETTING

It would be fortunate if we could study rationality in politics directly—and sometimes we can as when we investigate whether or not people vote in accord with previously expressed preference. But most political activity, especially that most interesting kind involving the work of professional makers of majorities and public policy, is not readily open to direct investigation. Consequently, we have used surrogate political subjects in a surrogate political setting and we offer evidence about their behavior as indirect evidence about political behavior in a wider world.

This study is based on the assumption that what happens in *n*-person games is closely analogous to what happens in politics. The main activity in an *n*-person game is making coalitions (that is, making policies that satisfy a majority), which is what political leaders spend most of their time doing. Political followers, when they act politically (as in voting), are mainly engaged in joining coalitions. Hence the game activity of making coalitions is very much like the essential activity of politics.

Games are not, of course, perfect analogies for unabstracted natural events, as indeed are not any other laboratory experiments in any social or natural science; but they are closer analogies for politics than any others yet offered. Surely they are closer to the characteristic action of politics than fantacizing on a psychoanalyst's couch. At least games involve those interpersonal transactions which are essential to politics, while behavior in confession does not even involve that. Games, furthermore, seem to us to be better analogies than learning experiments

which typically involve only problem solving and the avoidance of error. Politics does doubtless involve this, but it includes much more, especially the manipulation of relationships with others, creativity in organization, and the like. And these are precisely the kind of activities that are captured in the *n*-person game.

Conversely, behavior in games is probably more closely analogous to politics than is behavior in the market. Transactions in the market are by definition harmonious—at least in the absence of externalities—for every sale is a purchase and both buyer and seller invariably leave the market better off in utility. Even if no trades occur, no one is worse off. It is not so with politics. Some political situations such as elections, are zero-sum, i.e., such that the winner wins what the loser loses. And this guarantees the existence of losers, people who are worse off because they entered the political arena. Even if politics is not zero-sum, typically there are losers. Consider a civil war, say the American Civil War, which may have been zero-sum with respect to the governments but was surely not so with respect to the participants. The losers of that war precipitated it to protect (and extend) slavery; but what they got for their trouble was the Thirteenth Amendment. The war was not zero-sum because the winners did not get the slaves the losers lost. But the losers surely lost something and from hindsight we know they would have been wiser not to have fought at all. So it is with much of politics. Entry into the political arena necessarily involves the risk of loss which is not fully captured by market analogies. Game analogies, however, capture this feature of the real world.

There are, of course, many points at which the game analogy fails. One can try in the laboratory to introduce some of the features of the political world, but the game remains an analogy, not the real stuff of politics. In this experiment we have tried to compensate in a few ways not likely to occur to psychologists for the fact that the laboratory is not the wider world. For example, our subjects were self-selected (that is, they answered advertisements) and were allowed to drop out if they didn't like the game (usually because they lost), just as politicians are self-selected and remain or drop out by a kind of natural selection of winners. For another example, in some of the experiments the subjects played against each other several times and knew from the beginning that this would be so, just as politicians know and are constrained by the fact that they expect to meet again. (From the protocols, we know our subjects were conscious of the repetition, but we suspect that they were not nearly so preoccupied with it as

⁸ Richard Fenno, *The Power of the Purse* (Boston: Little Brown and Co., 1966). Otto Davis, M. A. H. Dempster, and Aaron Wildavsky, "A Theory of the Budgetary Process," this REVIEW, 60 (1964), 529-547.

politicians are said to be.) Again, our subjects, while initially unacquainted, saw each other in the laboratory often enough in intense situations to develop strong feelings of friendship and enmity, which we interpreted as the laboratory equivalent of loyalty, hostility, and even ideology in the political world. But we know, of course, that these putative equivalents are pretty pale imitations of these forces in political life. So, although we have tried to fit the laboratory circumstance to the political circumstance, we know we have not been wholly successful and the game remains only an analogy of politics, not politics itself. But until we can get real politicians to answer questions they would surely regard as silly, we think games in the laboratory are about the best we can do to study political behavior in exhaustive detail.

III. FEATURES OF THE GAME

Although the senior author has elsewhere described this game in some detail, we repeat a brief description of its major features:⁹

1. There are three players. In most groups of subjects these have been college undergraduates, although one group consisted of businessmen. All were from middle class backgrounds. Subjects were assigned to all three positions so that each subject played each position in about one-third of the matches he played.
2. The players negotiate in pairs about coalitions, usually thus:
 - (1,2) for five minutes, while 3 is in another room.
 - (1,3) for five minutes, while 2 is in another room.
 - (2,3) for five minutes, while 1 is in another room.
 This order is then repeated for three (or in some cases, three to six) more conversations. With two groups the order of conversations was varied.
3. At the end of negotiations, players are asked privately and individually what coalition they have formed. If two agree, they are paid, otherwise not.
4. Payments are according to the following schedule:
 - if (1,2) forms, it receives \$4.00
 - if (1,3) forms, it receives \$5.00
 - if (2,3) forms, it receives \$6.00
 - if (1), (2), (3), or (1,2,3,) form, they receive nothing.
5. The von Neumann-Morgenstern solution to

this game is that one of the following divisions of the stakes occur (the "principal points"):

Player 1	Player 2	Player 3
1.50	2.50	0
1.50	0	3.40
0	2.50	3.50

or that any one of an infinity of divisions occur, having the properties either:

- 1) $1.50 \leq x_1 < 3.50$, $2.50 \leq x_2 < 4.50$, $0 < x_3 < 2.00$,

and

$$\sum_{i=1}^3 x_i = 6.00$$

- 2) $1.50 \leq x_1 < 2.50$, $0 < x_2 < 1.00$, $3.50 \leq x_3 < 4.50$

and

$$\sum_{i=1}^3 x_i = 5.00,$$

where x_i is the payment to the i th player.¹⁰ The informal rules of this game were such that a division of the latter two sorts were hard to arrive at, although a few of our ingenious subjects found ways to get to them.

IV. INITIAL FINDINGS

As we interpreted the behavior of the initial group of subjects, it became apparent that they were behaving rationally in some profound and not immediately obvious sense. Experimentation was started with a game which had a solution of [(0,2.00,0), (0,0,4.00), (0,2.00,4.00)] but then was changed to the present game because the subjects found the original game very boring. It was not until this first group had nearly completed its matches with the present game that we realized that they were averaging something quite close to the von Neumann-Morgenstern solution, which is derived directly from utility theory and some elementary standards of rational behavior. That these subjects in these circumstances should, fairly consistently, come close to a socially rational solution seemed to us compelling evidence that utility theory was an appropriate description of their behavior. It seemed even more compelling from the fact that both the subjects and the experimenters were in effect unsophisticated about the solution.

Subsequent groups of subjects further and

¹⁰ John von Neumann and Oskar Morgenstern, *The Theory of Games and Economic Behavior* (Princeton: Princeton University Press, 1953, 3rd edition), pp. 403-418. A simple exposition of the derivation of this solution from the notions of utility theory can be found in R. D. Luce and Howard Raiffa, *Games and Decisions* (New York: Wiley, 1957), pp. 200-203, and William H. Riker, "Bargaining in a Three Person Game," *op. cit.*

⁹ William H. Riker, "Bargaining in a Three Person Game," this REVIEW, 61 (1967), 642-656.

strongly confirmed our belief by coming as close or closer to the solution, although in some groups some of the subjects were initially sophisticated (either because they had solved the game immediately upon learning the rules or because they had learned the solution from subjects in previous groups) and communicated their knowledge among the other subjects as the matches progressed for several weeks. Of the seven groups reported on here, the first, fourth, and seventh were initially unsophisticated and the first and seventh remained so to the end. Since sophisticated and unsophisticated subjects behaved about the same way in arriving at outcomes and since we know from observation and protocols that sophisticated subjects seldom let their knowledge hinder them from pressing a bargaining advantage or sadly recognizing a disadvantage, the degree of sophistication appears to be irrelevant. On the other hand, in their consistent propensity, sophisticated or not, to come close to the solution, each group of subjects further confirmed the belief that they were in sum and on the whole behaving rationally. Even in the five matches in group six where three-person coalitions were formed, the divisions were within the solution and hence quite rational.

In Table 1 is recorded a summary of the results of 206 matches in seven groups. The actual outcomes of each match are reported elsewhere.¹¹ For each two-person coalition, Table 1 records in the first row the number of times this coalition occurred. (Matches in which only single-member coalitions occurred—16 in all—are omitted as are the 5 matches where three-person coalitions were formed.) In the second row is the mean amount ($\hat{\mu}$) earned by the player in the designated position, while the third row contains the standard deviation ($\hat{\sigma}$) around the mean. (Since we have treated these as samples out of a population of possible matches, we have put hats over μ and σ to indicate they are sample estimates, in the case of σ an unbiased estimate.) In the fourth row is the t statistic and in the fifth row in the probability that a t statistic of that absolute value might be achieved by chance.

The information in Table 1 permits us to observe how very close the subjects often came to the von Neumann-Morgenstern solution. The null hypothesis is that the mean payoff to the

players is, for 1, \$1.50, for 2, \$2.50, and for 3, \$3.50. The probabilities of the occurrence of t 's of the particular absolute value (since this is a two-tailed test) indicate whether or not the null hypothesis can be rejected. From these probabilities, it is clearly apparent that the null hypothesis cannot be rejected, except possibly in the case of coalition (2,3) for group 4.¹² All other t 's are well within the range of chance occurrence. The inference then is that in all but, perhaps, this one case, the variations around \$1.50, \$2.50, and \$3.50 are insignificant random variations showing no particular direction or amount of deviations. Furthermore, one also infers that whether the subjects knew it or not, they were coming close to the solution and hence were acting as if to secure the predicted dollar rewards.

Nevertheless, while the net results of transactions as expressed in the divisions appeared clearly to result from rational behavior, paradoxically the individual behavior did not in itself appear to be rational in the sense of maximizing utility. Often subjects voted (and usually thereby chose between two alternative coalitions) in such a way as to reject the coalition that offered them the largest absolute value. For example, player 3 might be offered \$3.80 out of \$5.00 by player 1 and \$3.45 out of \$6.00 by player 2—and yet might choose (2,3) and \$3.45 instead of (1,3) and \$3.80. On a simple interpretation of maximization, clearly such a player was not maximizing. Still his behavior on the average turned out to be very close to what an abstract maximizer is calculated to bring

¹² By reason of another consideration this one case in which rejection of the null hypothesis is feasible does not invalidate the inference because the exception has a special explanation. See William H. Riker, "Experimental Interpretation. . . ." In groups 1-3, 5, and 6, the order of negotiations was [(1,2), (1,3), (2,3)] so that player 1 was omitted from the last certain conversation. For group 7, the order was [(2,3), (1,2), (1,3)], so that 2 was omitted, while for group 4, it was [(2,3), (1,3), (1,2)], so that 3 was omitted. The effects of omission were, for 1 and 2, that they simply did not win as frequently as might be expected although they won the expected amounts in each match. Player 3, however, won just about as frequently when omitted, but won significantly less money. Recognizing that this variation in outcome was thus occasioned by the informal rule that brought the mathematical game into temporal reality, we can then understand that this one deviation in the outcomes reflects not a failure to achieve the rational solution but rather a rational adjustment of the solution in response to a special rule.

¹¹ For groups one to three, see Riker, "Bargaining in a Three-Person Game;" for groups four to seven, see Riker, "An Experimental Interpretation of Formal and Informal Rules of a Three Person Game," in Bernhardt Lieberman, *Social Choice* (forthcoming).

TABLE 1. SUMMARY OF OUTCOMES OF MATCHES BY GROUPS*

	Coalition (1, 2)		Coalition (1, 3)		Coalition (2, 3)	
	1	2	1	3	2	3

* Matches resulting in single member coalitions omitted.

** Matches resulting in grand coalitions omitted.

about. Clearly, there is something wrong with an explanation in which individual irrationalities add up to group rationalities.

It seemed likely on the basis of unsystematic questioning, however, that the subjects were not really behaving irrationally in their individual choice. Instead of maximizing dollar amounts, they initially seemed to be maximizing expected values of the prizes. That is, they seemed to be discounting their anticipated share of the payoff to a coalition by the probability that the coalition would actually occur. Hence, the choice of a smaller amount over a larger might indicate simply a greater confidence that the coalition with the smaller individual payoff would actually form.

This concern for actual formation of a coalition provides a key to interpretation. The central interest of subjects lies not in the amounts won, but in the fact of winning. And if the fact of winning is the central concern, then the value of the prize is secondary. Indeed the subjective value of the prize is probably dependent on the chance one has of getting it. Thus a player proposes a given division of the payoffs because he feels that a coalition could form around this division and alters a proposed payoff structure in an attempt to increase the likelihood of forming a winning coalition. A player who wishes to win does not typically make proposals that he feels have little chance of acceptance.

In this view of subjects' goals, coalitions are seen as being only winning coalitions or losing coalitions with very little interest in the amount won. We assume that a player attempts to form that coalition which he perceives as having the highest probability of winning—i.e., he votes for the player he feels is most likely to vote for him. In this interpretation, then, utility maximization is maximization of the probability of winning.

In order to test for this possibility, subjects in groups 5, 6, and 7 were asked (after each set of three conversations) to estimate the probability that each of the others would vote for them, as well as probabilities for their own vote and for the formation of the several coalitions. To assure that these probabilities were not thoughtlessly estimated the questions were constructed so that the subject was forced to add them up to 1.00. The data from those questionnaires filled out just before the voting provides the basis for a test of the probability maximization interpretation.

Assume that the subject ordered his preferences so that, if P_1 and P_2 are the perceived probabilities of winning in each of two possible coalitions such that $0 < P_1 < P_2$, then the subject preferred P_2 to P_1 and P_1 to 0 and P_2 to

0. Note that this is an assumption of substantive rationality, that is, we have imposed a goal for the subjects to maximize toward and assumed that this goal is appropriate to the situation they are in. We know that his goal may not be wholly appropriate for at least two subjects, both of whom were fairly consistent losers. One subject in group five who, out of 10 matches, won only the first, third and ninth, became especially sulky after his eighth match. After a long dry spell, he had confidently expected to win because of a long term agreement made in his first match. But he lost and felt betrayed and announced he would play no more. He subsequently agreed to play the two further matches for which he was scheduled, but his heart was not in it. Although he actually won one of them, he behaved as if it were beneath his dignity to win and it is possible—though not certain—he preferred to lose. Another subject in group six, who, out of nine matches, won only the fourth and eighth, adopted a stance in bargaining that made him an almost certain loser. Midway in this series subjects invented a method of enforcing trust by exchanging objects of value (such as books, meal tickets, etc.) to be re-exchanged after a bargain to vote for each other was carried out. But the losing subject rejected all such bargains proffered on the ground, invented by himself, that they were not in harmony with the game. It seemed to these observers that his policy served the purpose only of providing himself beforehand with an excuse for anticipated failure. That is, he could say to himself, "I may be losing, but at least I am more ethical than these other fellows." So he too may actually have preferred to lose, for by guaranteeing himself a loss ahead of time he avoided thus the shame of losing when he was trying to win. But these are only two subjects out of 34 in the three groups and their possible preference for losing might have occurred in only six of their 19 matches. Using these two as contrasts, all other subjects appeared to the observers to want to win. We feel safe, therefore, in attributing to all subjects the preference order of P_2 to P_1 , P_1 to 0, and P_2 to 0.

To determine whether or not subjects were maximizing the subjective probability of winning, let $\hat{p}(ij)$ be the i th player's estimate of the probability that the j th player will vote for i , and let $\hat{p}(ik)$ be the i th player's estimate of the probability that the k th player will vote for i . If subjects were maximizing probabilities, then their decision rule must have been the following:

If $\hat{p}(ij) > \hat{p}(ik)$, then i votes for j ;
 If $\hat{p}(ik) > \hat{p}(ij)$, then i votes for k ;
 If $\hat{p}(ij) = \hat{p}(ik)$, then i votes for either j or k .

On the basis of this analysis, we find that the subjects' voting behavior overwhelmingly supports this probability maximization model.¹³ Almost 92% of the voting decisions studied (275 out of 300) can be explained by the probability maximization criterion. Considering that we were careful never to discuss their probability estimates with the subjects in order not to encourage them to rationalize their choices, 92% seems a remarkably high proportion of maximizations.

Yet not all of the 25 instances of failure to maximize can be consigned to the dark world of the irrational. For example, two subjects recognizing that they could more likely win by voting differently, nevertheless chose not to maximize in the current match in order to maximize in a future one. Thus in group 7, match 18, player 1 estimated his chances

from 3, \$1.65 @ odds of .8 or \$1.24
from 2, \$1.45 @ odds of 1.0 or \$1.45.

He voted for 3 and won, explaining his choice on the questionnaire thus: "I have 2, but am thinking of the future," (Since there were only six subjects in the group, each of whom was matched with each of the other four times, he knew for certain that he would meet 3, but not 2, in the one match remaining for him to play. In the conversation after the match, he indicated that this consideration had been the controlling one for him throughout the entire match and indeed he had used it as an argument to secure the adherence of 3.)

Thus of the 25 instances of non-maximization of the probability of winning, 11 appear to have involved an attempt to maximize dollars won. So it can be said that in 286 out of 300 cases, or about 95%, subjects behaved as if they were maximizing some utility of winning.

In the remaining 5% of the cases, however, subjects appear not to have maximized. Some failed to do so quite deliberately for they expressed (in remarks on the questionnaire) opinions that indicated other goals were greater for them than maximization of probability of winning. For some the sanctity of a promise was of greater value. Thus in group 6, match 16, player 3 (who lost) explained: "My word to player 1 is inviolable, although I don't think he considers it such. I'm probably throwing money away, but my vote is 1." (Player 3 was the one, previously mentioned, who almost always lost and refused to bargain in the accepted way because he—iconoclastically—believed this way to be out of harmony with the rules.) For others, it was

more important than money to avoid hurting another. Thus in group 6, match 38, player 1, who by reason of a row between 2 and 3 (of which he had taken advantage) knew that both would vote for him, wrote somewhat shamedly on his questionnaire: "I really feel rotten about the whole thing. I don't want to screw anyone, so I flipped a coin to determine which player to vote for." For still others, gambling itself was of greater value than a sure prize. Thus in the last match in group 7, player 1, who was sure of \$1.50 from 2 and less sure of \$1.55 from 3, still chose 3, explaining: "I'll try for 3 'cause I'm a gambling man—can't lose that much—even though joining with 2 seems a surer victory."

Of the 14 instances of apparent non-maximization, most seem to be based on a sense of honor or the impulse to gamble. Were we using a procedural criterion of rationality, these would also be considered rational since they clearly preferred honor and some money to dishonor and more money. But since we are using a substantive criterion (higher probability of winning rather than less), we must count them as irrational. The remaining instances seem to be that kind of conventional irrationality best summarized by the subject (group 6, match 7, player 1) who wrote on his questionnaire: "total confusion, total insecurity, complete distrust." In these instances, subjects probably behaved irrationally because they were confused (or in some cases, stupid) and distressed by losing.

V. EXPLANATION OF RESULTS

On the basis of the evidence just offered that from 92 to 95 per cent of the choosers tried to maximize the probability of winning and that the majority of others were apparently trying to maximize where some alternative other than winning stood higher in their order of preferences, it seems to us clearly the case that the probability maximization theory—here identical by our assumption to utility maximization theory—describes this surrogate political behavior very well. One can confidently expect, however, that proponents of other viewpoints will try to explain this fairly strong evidence away. Anticipating such reaction, therefore, we offer further evidence that, not only is probability maximization a good explanation, but also that it is a better explanation than the alternatives.

Those who assert that choosers do not employ a rational calculus but make up their preferences to fit some previously determined and affective choice are usually hard to answer because one has no way to get inside the choosers' psyches. So if it is said, for example, that player *i* voted for *j* because *i* felt an intense homosexual attraction for *j*, it is usually not

¹³ Details for the test of each case are available from the authors.

possible to prove or refute such an assertion. No evidence pro or con exists. And in the absence of evidence, the psychoanalytic and the probability maximization theories seem equally good (though equally unverifiable) explanations.

For this experiment, however, there is a way to get inside the psyches, at least a little bit, and thus to make a judgment on the adequacy of the alternative explanations. In this case, the choices made depend not only on the preference structure of the chooser but also on his estimate of the state of nature. One can, therefore, look at these estimates: Are they accurate or inaccurate? Do they apparently reflect an intent to make a careful estimate or do they reflect simply indifference?

We offer the following theory: If the subjects make accurate estimates of the actions of the others (the state of nature), then it can be supposed that, when they choose as if maximizing the probability of winning, they are in fact doing so. If, on the other hand, subjects make inaccurate estimates, then it can be supposed that the state of nature is irrelevant to their choice and that the apparent maximization is simply window dressing to cover up to themselves (i.e., reduce the cognitive dissonance occasioned by their Oedipal urges, etc.).

Suppose the subjects are found to make accurate estimates of the external world. Then the plausibility of the probability maximization theory is strengthened because it appears that subjects are making a careful estimate of their chances to win—the crucial feature of the probability maximization calculus. It appears also that in expending energy on careful estimates, subjects want to maximize. Suppose, however, subjects are inaccurate. Then the plausibility of the probability maximization theory is weakened for it appears to be based on a half-fictional calculation.

Conversely, for the antirational theories, inaccuracy about the external world renders calculation meaningless and suggests therefore that the subjects were not calculating to begin with—which is precisely what the notions of cognitive dissonance and psychoanalysis assert. Thus inaccuracy strengthens the plausibility of these theories. But accuracy weakens it, for if subjects expend enough energy to be accurate, it appears that subjects believe knowledge of the state of nature is important in their choice, in their calculation, indeed. Hence the probability estimates are more than window dressing and the plausibility of a theory that restricts them to this role is weakened.

In these experiments, subjects were on the average surprisingly accurate in their estimates of the state of nature (i.e., their judgments of

how the other players were going to vote). The data is set forth in Table 2, where the estimates of a player about the behavior of others are compared to what the other players actually did. Since the subjects estimated a probability between 0 and 1 for receiving the votes of each of the others, while the voting itself was dichotomous, one cannot measure individual accuracy except in a gross way. But the accuracy of the entire group of judgments can be measured, thus: For all those who estimated that another player would vote for them with a chance between 0 and .2, it should be the case, if the group is perfectly accurate, that ten per cent of those so estimated (i.e., the midpoint of the interval between 0 and .2) actually do so. For estimates in the interval .21 to .4, thirty per cent of those so estimated should actually do so, etc. Thus we have a definition of accuracy for the entire group. Inaccuracy, on the other hand, would occur if, for all those who estimate that another player would vote for them within a given interval of probability (say, again, 0 to .2), it is actually the case that fifty per cent of the others actually do so. Thus inaccuracy is discovered by the fact that voting by the others is random with respect to the subjects' estimates.¹⁴

The results stated in Table 2 are depicted in Figure 1, where the per cent voting for the estimator (on the vertical axis) is plotted against the estimates in intervals of .2 (on the horizontal axis). The straight lines in the Figure represent perfect accuracy and random behavior or inaccuracy, while the curved line indicates the actual degree of the subjects' accuracy about the other players' behavior.

It is apparent from Figure 1, that subjects were on the average quite accurate with respect to the behavior of the other players. The line connecting the per cent voting for in each of the five categories is close to and has about the same slope throughout as the line indicating perfect accuracy. Moreover, it has been demonstrated elsewhere that these discrepancies from perfect accuracy can be attributed to sampling error.¹⁵ On the basis of this evidence, therefore, it seems reasonable to reject anti-rationalist theories conclusively as explanations of this surrogate political behavior.

It is not so easy to reject learning theory. For the events of these experiments, an explanation in terms of learning theory would empha-

¹⁴ We wish to thank Gerald Kramer for help in developing this test.

¹⁵ William James Zavoina, *The Rational Calculus of Coalition Formation*, unpublished Ph.D. thesis, University of Rochester (1969).

TABLE 2. ACCURACY OF SUBJECTS' ESTIMATES OF OTHER PLAYERS' VOTES

Probability of Receiving Other's Vote	Subjects' Estimates of Other's Votes					
	0.0-.20	.21-.40	.41-.60	.61-.80	.81-1.00	Total
Others' Actual Vote	For Against	For Against	For Against	For Against	For Against	
Group 5 less victims of con- spiracy*	1 31 (-2)	10 11 (-1)	30 31 (-4)	40 33 (-8)	38 15 (-3)	240 (-18)
Group 6 less victims of con- spiracy*	4 32 (-1) (-1)	9 19	34 45 (-1)	29 20	43 5 (-1)	240 (-4)
Group 7	4 4	3 16	5 16	17 16	31 8	120
Total Votes	8 64	22 45	68 88	86 61	112 24	583
Percent Received	11%	33%	44%	60%	83%	

* In eleven matches, two of the players formed a conspiracy against the third thus: i and j agreed on a satisfactory imputation and on a plan of conversations of i with k and j with k . This plan typically provided that both would falsely report to k an (i, j) agreement highly advantageous to j and that i would then seek a better agreement with k though still not as good for i as the real (i, j) agreement, while j would seek an agreement with k (also not as good for j as the real (i, j) agreement) on the ground that he (k) distrusted i 's extravagant offer. Functionally, this served to guarantee to both i and j that they were better off with each other and that they could trust each other. Of course, it also meant that k 's judgment of the external world had no relevance to what that world was really like. Since his judgment concerns a fictional world created for him by the conspirators, we have omitted k 's judgments from this table.

size that subjects determined their partners, not by a calculus but by more or less random experimentation which, if successful, would be repeated and, if not, not. And indeed something of this appears to have happened. One can reject learning theory, therefore, not because it fails to explain behavior, but simply because it does not explain it as well as the utility maximization theory.

In the 100 matches studied here, there were, of course, 300 pairs of subjects. Of these 160 pairs were inexperienced with each other in the sense that they had not met previously in a match—and in most cases had never met consciously at all. There were, however, 140 pairs in which subjects were experienced with each other in the sense that the members of the pair had played with each other in a previous match, in some cases in two or even three previous matches. While learning theory could hardly say much about behavior of subjects in the 160 inexperienced pairs, it can say something about the behavior in the 140 experienced ones.

In general, learning theory suggests that, for these 140 pairs, if previous experience had led to success (i.e. voting for or against and winning),

then the members of these pairs would repeat the previous choice. If previous experience had led to failure (i.e. voting for or against and losing), then the prediction is not so clear. However, if on previous experience in a pair, a player voted for and lost, it would seem to be a good indication to vote against on the second match, if only because he knows that voting for is not successful. On the other hand, if a player voted against another and lost on the first meeting, there is almost no guide to action. He knows only that voting against the other did not work, but he is quite inexperienced about the results of voting for. In such case, there is no really good prediction inasmuch as it is reasonable either to vote for as an experiment or to vote against on the basis of experience.

The data to validate these predictions is set forth in Table 3, where the individual experience on the just-previous match—earlier matches, when they occurred, are ignored—is compared with the action taken by the individuals in the current match.

As is apparent from Table 3, the tests of the predictions from learning theory are in part beyond reasonable chance. But still the explanation

FIGURE 1. Accuracy of Subjects' Estimates of the State of the External World

is not as good as the explanation from utility theory. In the first place, learning theory says nothing about the majority of the cases for the subjects had to act in an environment that denied them a previous experience. (Some will say this is not a fair test of a theory; but then the world is full of new conditions and the rat has to go through the maze a first time.) Even when a previous experience was provided, however, the explanation from learning theory is weak. Only 43 per cent of the relevant behavior is explained (i.e., that recorded in the first three columns of row one of Table 3), while in the probability maximization theory from 92 to 95 per cent of the relevant behavior is explained. Furthermore, only the behavior summarized in column 1 of Table 3 is explained well because the favorable results of the test in columns 2 and 3 may easily have occurred by chance. On the other hand, the possibility that chance may have produced the result in the test of probability maximization is almost zero. This is, the probability that one might obtain by chance 275 "yes" out of 300 tries is less than .000001. This value is considerably smaller than that associated with the best prediction under learning theory. Thus, comparing the two viewpoints, learning theory only weakly explains behavior in

the limited range of behavior to which it applies, while the theory of probability maximization explains behavior most of the time. Certainly, for this surrogate political behavior, probability maximization appears to be the more plausible theory.

VI. CONCLUSION

In the introduction we observed that each of the viewpoints toward rational behavior was supported by good evidence in the area of behavior to which the viewpoints were originally applied. Furthermore, we pointed out that, owing to the neglect by political theorists, we had no idea of which area of behavior was the one where political behavior typically belonged and hence we had no idea of what viewpoint toward rationality was appropriate for political science. Finally, we indicated that, whether we wanted to or not, our ignorance on this point had to be repaired if we wished to do sophisticated political studies.

This essay is an effort to repair this ignorance. Unfortunately it deals with surrogate politicians in a surrogate political setting. Since this is probably the best we can get, however, the conclusion that the theory of probability maximization is a more plausible explanation than its alternatives for the behavior studied suggests

TABLE 3. VOTING IN EXPERIENCED PAIRS

		Experience of Subject in Just Previous Match Involving Other Player in Pair			
Action of Subject in Current Match	Votes For	Voted For		Voted Against	
		Won	Lost	Won	Lost

cell (1, 2) < cell (2, 2)		True		$Pr[22 \text{ For}] < .33$	
cell (1, 3) < cell (2, 3)		True		$Pr[36 \text{ For}] < .08$	
cell (1, 4) \simeq cell (2, 4)		Approximately True [#]			

* That is, assuming independent choices with a .5 probability of choosing For, the probability of obtaining by chance 63 or better Fors out of 94 tries is less than .00063.

[#] Since there is no standard of randomness here, a probability of deviation from it cannot be calculated.

that in the interpretation of real political phenomena it is safest to assume that politicians are calculating maximizers.

Doubtless, however, some will resist the analogy from the game saying that the behavior studied was "really" economic rather than political since it involves a monetary reward. But at least since Marx most students of politics have been willing to admit that all of politics involves monetary rewards. And certainly the calculating behavior in this game involves something more than the economic process of maximizing a monetary reward inasmuch as the subjects had to maximize in the face of a highly political kind of uncertainty about how others would vote.

Doubtless, also, some will resist the analogy saying that the behavior studied was simple compared to the complex world of real politics. But it is hard to be sure about degrees of complexity. Surely our subjects often faced a world fully as uncertain as the world of politicians. And while they had but two alternatives to choose from, it is also true of the political world that politicians constantly seek to narrow their range of choice, not only in personal decision, but also in our institutions. Thus, we vote on two candidates, we vote yea and nay on motions, we are offered two parties (or, failing that, government and opposition), etc., etc. In short, in the world outside the laboratory, we seek constantly to make the problem of decision

no more complex than the decisions facing our subjects. So far as we succeed, there is not much difference in complexity between the two worlds.

Nevertheless, still others will resist the analogy saying that, even if politicians succeed in simplifying their decision problems, still the laboratory scene and the people in it lack all that lush growth of ideology and organization found in the real political world. This we of course admit; but it still is true that our subjects, while simply students, were drawn from the class of people who grow up to be politicians and that the laboratory scene did have those features of coalition-formation winning and losing, manipulation of others by both rhetoric and contrivance, etc.—all of which are fundamental to politics and are the building blocks of ideology and organization.

It is possible that one kind of real political situation exists for which the game analogy is quite inappropriate and this is the situation where participants are not conscious of having a choice. One can hardly compare alternatives where there are none to compare. And it may be that much of the time people have no choice, though one strong theological and philosophical tradition insists that choice is always present. But where choice is possible, the message in the evidence from this experiment, though indirect, is crystal clear: utility maximization is the theory that fits political behavior best.

BARRINGTON MOORE AND THE DIALECTICS OF REVOLUTION: AN ESSAY REVIEW

STANLEY ROTHMAN
Smith College

"When I use a word," Humpty Dumpty said, in rather a scornful tone, "it means just what I choose it to mean—neither more nor less."

"The question is," said Alice, "whether you can make words mean so many different things."

"The question is," said Humpty Dumpty, "which is to be the master—that's all."

Through the Looking Glass

I. INTRODUCTION¹

It is not hard to find reasons why Barrington Moore's *Social Origins of Democracy and Dictatorship* has had such widespread influence.² Its approach, that of comparative, historical sociology, seeks clues to the present in the past, and Moore demonstrates mastery of a wide range of historical materials. Yet I feel that the book is ultimately unsatisfactory, for it is marred by a lack of respect for its own sources of information and by contradictions and *non-sequiturs* at critical points in the argument.

In this critique I shall first examine the general thesis of the book and then turn to the case studies which Moore uses to support his arguments. I shall also attempt to account for the sharp contrasts in the quality of scholarship which characterize the study, and will attribute them to Moore's preconceived ideological assumptions about the nature of the good society.

II. THE OVERT ANALYSIS

The central argument of the volume seems to be about as follows:

Historically, societies have industrialized in one of three ways. Each of these has involved violence and the exploitation or oppression of a large bulk of the population by a "ruthless" ruling class. (24, 28-29, 287, 297, 386, 410, 506.)³

The first route taken by England—and with variations by France and the United States—may be called the bourgeois-capitalist-demo-

cratic road. This route required a violent revolution designed to destroy the power of at least a portion of the traditional elite. It also involved the "ruthless" exploitation of both the peasantry and the working class in the early stages of industrial development.

The second road was taken by Germany and Japan. Here the bourgeoisie, too weak to assert itself, joined with a quasi-feudal landowning class in an attempt to modernize society within its traditional social framework. Industrialization was not achieved without exploitation, but revolutionary upheaval was avoided. However, the ultimate outcome was Fascism, and in Germany at least, genocide.

The third route, that of Communism, has occurred in those societies in which the ruling classes could not successfully industrialize. Communist regimes generally come to power on the backs of peasant revolutions, and end with the elimination of the peasantry and the development of a repressive system comparable to although different from that in capitalist countries.

One of these three roads, Moore argues, has been more or less inevitable, and together they exhaust the possibilities of social change. Today the bourgeois capitalist route to modernization seems obsolete, the Fascist road too horrible to contemplate, and even the traditional Communist road (i.e., the Soviet road) historically dated, although China may avoid Russia's mistakes.

Indian political leaders have attempted to avoid these choices and to modernize democratically. Moore thinks they have failed, and he hints fairly strongly that an authoritarian regime will have to emerge if India is to solve her problems.⁴

The evidence Moore brings to his argument is to be found in his case studies. Thus, his choice of cases becomes crucial. Moore could not deal with every country in the world, but his general theory of social change, so far as I can determine, is not at all applicable to black Af-

¹ Professors R. Jackson Wilson, Daniel Aaron, Cecelia Kenyon, Murray Kitley, Guenter Lewy and Malcolm Smith all read an earlier version of this essay and offered criticisms. Professors Wilson and Aaron were especially helpful. Naturally, the errors which remain are mine.

² (Boston, 1966).

³ As with many other of his statements, Moore occasionally hedges (508, for example), but this is the overall thrust of his analysis.

⁴ The general argument is summarized on pp. xv-xvi, 413-414. On the obsolescence of bourgeois capitalism and Russian Communism, see pp. 507-508, 483. On Moore's hopes for China, see p. 230. I will add additional references in the sections on specific countries.

rica or to the Middle East, and, thus, to much of the "third world." In addition its applicability to countries like Sweden or Norway seems problematical.⁵ Moore specifically excludes the Scandinavian countries from his discussion, arguing that, since they are small countries which "depend economically and politically on big and powerful ones . . . the decisive causes of their politics lie outside their own boundaries." (xiii) Moore offers no support for this argument, yet deals in great detail with at least one country—India—which was influenced in very decisive ways by an outside power. One suspects, then, that other reasons lay behind his choices.

Of more significance at this point are Moore's neo-Marxist assumptions as to the underlying pattern of social causation. He argues (1) that the mode of production in a given society determines ideology of the social classes of which it is composed and its political structure, and (2) that all ruling classes have as their primary goal the fullest possible exploitation of those whom they dominate. Ecological factors are unimportant and cultural variables are epiphenomenal since they either reflect the economic system or are mechanisms used by the ruling classes to further their own interests. Thus, Northern commitment to an anti-slavery position in the American Civil War is to be explained by the emergence of an urban capitalist civilization; and Hinduism and the caste system, symptoms of India's historical backwardness, both survived only because they served the interests of the ruling strata. (123, 136, 335-36.) Nor are Japanese cultural patterns relevant to an understanding of the Meiji Restoration, which was based entirely on the self-interest of a particular segment of the ruling class, just as the support of social legislation by the English bourgeoisie in the mid-nineteenth century was merely a sop to the lower orders, because everyone knew that the bourgeoisie now dominated English politics. (240, 245, 441.)

The mode of production and class exploitation are key to Moore's overall historical analysis. Past revolutions have been inevitable, because the ruling classes were unable to transcend their own ideologies and unwilling to accept lim-

itations upon their opportunities for exploitation.

Moore essentially claims that his frame of reference enables him to systematize the study of comparative history more effectively than alternate models, and that he was forced to his conclusions by the facts themselves. (356, 505 and the Preface.) However, Moore also levels a sharp theoretical attack upon models that give more weight to cultural variables, specifically the work of Max Weber, who emphasized the uniqueness of European history, and developed what is perhaps the most powerful modern theoretical alternative to a Marxist or neo-Marxist analysis.

An overall evaluation of the value of Moore's categories must await an examination of their utility in dealing with the various countries with which he is concerned, but the following reflections are not out of order at this point.

First, Moore's two central propositions have no necessary connection. The values of a given social class may be determined by its economic position, but this does not prove that these values necessarily involve the maximization of its opportunities for "exploitation."

Further, the propositions are not equal in explanatory value. The discovery of economic correlates for the *Weltanschauung* of a particular class may be offered as evidence that these factors were causal, but to assert that a given *Weltanschauung* is supported because it is self-serving explains little or nothing. Even if the ruling classes in India were only interested in exploitation, this would not tell us why they chose Hinduism and the caste system as their instruments. Moore's volume, as we shall see, is full of question-begging explanations of this type.

Sometimes, as a last resort, Moore does give an independent role to cultural and ecological variables, even though he would seem to weaken his thesis in the process. For example, what is one to do with an analysis which continually downplays the role of ideas and then lists as one reason for the mild treatment of the Chartists by the English ruling classes the fact that:

Russell was a doctrinaire Whig devoted to the ideal of liberty and anxious to avoid encroaching on the free discussion of political issues. (34.)

There are many other instances of the *ad hoc* introduction of other variables. After emphasizing economic factors in the behavior of the English bourgeoisie, Moore suddenly brings in England's reliance upon a Navy (stemming, one assumes, from the fact that the country is an island) as among those factors which explain the

⁵ For that matter the analysis seems inapplicable to those countries in Southeast Asia, e.g., Thailand, which, for all practical purposes, lack a landowning gentry. On Thailand see: David A. Wilson, *Politics in Thailand* (Ithaca, 1962), p. 52; James Mosel, "Thai Administrative Behavior" in W. J. Siffin (ed.) *Toward the Comparative Study of Public Administration* (Bloomington, 1959), pp. 283-288; and D. Insor, *Thailand* (New York, 1963), pp. 44-45.

lack of repressiveness of English society. (32, 444.) It is almost the only time that this variable is mentioned with regard to England, and Moore doesn't even consider why Japan's island position did not play a similar role. Or, to take another example, he argues that Japan's imperialism was the result of economic contradictions which led to Fascism. English imperialism, on the other hand, was the result of:

... a combination of adventure, reasons of state, commerce, and plunder: motives and causes that were really indistinguishable during that burst of energy released all over Europe by the decay of the traditional Christian medieval civilization and the rise of a new and much more secular one. (342.)

Moore's habit of blending quasi-economic determinism with other whimsically introduced factors, including cultural variables, makes it hard to systematize his position, and raises serious questions about his interpretation of the societies which he uses to illustrate his general theory. Indeed, since he offers no explicit criteria one gets the impression that decisions as to what weight he should accord cultural factors were based less on a concern with placing his material in a theoretical perspective, than upon a desire to convince his readers of the validity of assumptions brought to his study.

Moore's discussion of exploitation suffers from similar limitations. He considers the concept objective and measurable. In fact, he lists the criteria which determine whether a given class relationship is exploitive. But, although in theory he allows for gradations in exploitation, the English, French, German, Japanese, Indian and Chinese aristocracies all seem to have shared one aim, that is, to squeeze as much out of their peasants as possible.

One wonders whether a concept which is not used to differentiate among societies, has any empirical utility. The confusion is increased by Moore's tendency to hedge. Peasants, he argues, revolt because of objective exploitation. If they revolt even while their objective situation is improving, it is only because they realize that the "lord's exactions increased and his contribution . . . declined." (473.) If they don't, their failure to revolt is explained by inertia. As for those peasants who resist the revolution, Moore redefines them as being part of the exploiting classes because of shared ideas. Thus they present no analytic problem. Moore says of the French Revolution that:

To be sure, there were members of roughly the same social strata fighting on opposite sides. But they were fighting for opposed social objectives. . . . Victory for one side or the other meant the victory or defeat of class privileges. On these

grounds alone it seems impossible to deny that the Terror was an instrument of class warfare. . . . (518.)

Furthermore the evidence which he offers to prove that a given ruling class has been entirely exploitive and almost entirely parasitic is not always very compelling. For example, he argues that the Chinese gentry fulfilled hardly any useful function in Chinese society. (203-05.)⁶ Most contemporary scholars, on the other hand, would contend that China attained relatively high levels of general prosperity, social order and cultural and commercial development during the height of the Ch'ing dynasty in the seventeenth and early eighteenth centuries. Certainly the political order must have played some role.⁷ But, Moore argues that the increase in population which occurred at that time and which most observers might take as a sign of effective social organization and rising living standards, did not stem from these factors. Rather it was the gentry who increased the birthrate of the peasants in order to drive up the price of land and to impoverish the masses. (168.) On the face of it the argument is less than convincing. During the early part of the period, at least, living standards continued to rise despite the increase in population, partially because the regime sponsored the opening of new areas for cultivation and introduced new crops.⁸ Ping-ti-

⁶ Moore does mention the improvement of irrigation, but downplays its importance. Indeed the major purpose of improving irrigation was to increase the possibilities of exploitation. (169.) He also argues that its role in the maintenance of order was unimportant, given the place of the clans in administering local justice. Besides, when large scale banditry did develop it was largely the consequence of exploitation by the ruling class. What evidence, one wonders, is relevant to the question of measuring exploitation? Moore, in effect, has it both ways. If a ruling class does literally nothing, it is clearly parasitic, but whatever functions it performs are performed for bad reasons and it is still parasitic.

⁷ See Ping-ti Ho, *Studies on the Population of China, 1368-1953* (Cambridge, 1959), pp. 268-270. Moore cites Ho several times but appears to deny that living standards were rising for the population as a whole. (*Origins*, 179.) Interestingly enough, however, he does argue, at least indirectly, that China was better off than India in this regard, and Japan was better off than China (*Origins*, 330-333 and *passim*.).

⁸ Ho, *op. cit.*, 269. Edwin O. Reischauer and John K. Fairbank, *East Asia: The Great Tradition* (Boston, 1958), I, p. 393.

Ho, whom Moore relies on for population data, argues that the Chinese were hoist by their own petard. Having created conditions of general prosperity, the régime was finally faced by over-population in relation to resources, under circumstances in which it had reached the limits of its capacity to raise levels of productivity within the framework of the existing system.

Whether or not the Chinese gentry did at one time serve some function in Chinese society has little to do with the general conclusions which Moore reaches about the necessity for a modernizing revolution in China. The difference between Moore's view and one which emphasizes the irony of Chinese development is a difference between a view of history as involving genuine tragedy, and one which sees it as a conflict between heroes and villains. Despite Moore's explicit disclaimers, it is quite clear that the latter is his perspective.

Finally, Moore's stake in proving that all ruling classes are completely exploitive sometimes leads to contradictory appraisals. Thus, he usually describes Feudalism as "gangsterism." But, in talking of modernizing elites, he concedes that feudal arrangements had at least protected the peasants against grosser forms of exploitation.⁹

* * *

Moore offers several reasons for rejecting approaches to the study of society which give significant weight to cultural factors. He implies, first, that such explanations tend to emphasize continuity and downplay change, and thus have a conservative bias. (485-86.) There seems little intrinsic reason why this should be so, and Moore offers none. Max Weber, whom Moore spends a good deal of time criticizing, uses cultural variables, in part, to explain the great European revolutions which began in the seventeenth century, and Robert Heilbroner has come to conclusions about the third world at least as radical as those of Moore, by emphasizing the role of cultural impediments to peaceful change.¹⁰ But, even if the charge were true, it would not constitute an adequate scholarly reason for rejecting explanations of this type.

Nevertheless, his attack on the use of "cultural-continuity" explanations is worth examining in detail because it undermines his own approach, although he may not realize this. "The assumption . . . that cultural and social continuity do not require explanation," notes Moore:

⁹ Compare, for example, *Origins*, 10, 214, 241 with *Origins*, 12, 194.

¹⁰ In "Counterrevolutionary America," *Commentary* (April, 1967), pp. 3-10.

obliterates the fact that both have to be recreated anew in each generation, often with great pain and suffering. To maintain and transmit a value system, human beings are punched . . . cajoled, bribed, made into heroes, encouraged to read newspapers, stood up against a wall and shot. . . . To speak of cultural inertia is to overlook the concrete interest and privileges that are served by indoctrination . . . (486.)

Earlier he had argued:

Such explanations are logically the same as the famous explanation of the effects of opium as being due to its "dormitive" properties. They beg the fundamental question: why did this particular outlook prevail when and where it did. (240.)

Moore is unfair. Those who argue that the cultural inheritance of a society is a significant part of any explanation of its dynamics do so on the basis of some fairly sophisticated propositions concerning the transmission of cultural values. And Moore himself, despite his strictures, is sometimes forced to recognize the "stickiness" of cultural patterns. In the same chapter from which the above quotation is taken, he explains the revolt of at least some samurai against the new Japanese regime as a function of the difficulties of shedding romantic "feudal notions." (252.)

More importantly, as Moore's own "question-begging" explanations indicate, economic self-interest does not exist in a vacuum. If we must take account of the concrete interests that are served by adherence to certain cultural norms, the reverse is also true; men define their interests in terms of the values which they deem important.

Further, Moore himself tends to emphasize continuity, albeit in a rather different way from those whom he criticizes. For example, in explaining the acceptance by the Chinese peasant of a regime which was fundamentally exploitive, Moore argues:

. . . it seems more realistic to assume that large masses of people, and especially peasants, simply accept the social system under which they live without concern about any balance of benefits and pains . . . unless and until something happens to threaten and destroys their daily routine. Hence, it is quite possible for them to accept a society of whose working they are no more than victims. (204.)

Is this explanation of continuity any more satisfactory than a "cultural" explanation? Indeed it is less so, for it does not suggest any mechanism by which ideas about these institu-

tions are transmitted. Unlike most sociologists concerned with the transmission of culture, Moore puts considerable emphasis on the violence done the individual by the socialization process. Somehow, he seems to feel that this weakens an argument which takes cultural continuity for granted. But why? If the process of socialization were as brutalizing as he makes it out to be, it might strengthen the hands of those who urge that continuity is natural, and change that must be explained. Having given up so much in the process of becoming part of any society, adult members of that society would resist proposed changes in the value structure with considerable ferocity. In short, Moore's argument proves nothing.

In criticizing Max Weber Moore wishes to undermine an interpretation of European developments which stresses the role played by Christianity and more specifically English Calvinism. His basic argument is that one can find the characteristics associated with the Protestant ethic in all of the societies under study, and that therefore the emergence of Calvinism cannot be used as an explanation for English economic and political developments. But, as Reinhard Bendix points out, Weber never argued that the Protestant ethic was the only reason that capitalism emerged first in Europe. Rather, his analysis deals with Protestantism as one variable among others.¹¹ Secondly, in proving the existence of a "Protestant ethic" in India, or China, or Japan, Moore relies heavily upon travelers' reports. These, of course, are of very limited value, and Weber never denied that at least some of the values associated with the "Protestant" ethic might be found to a limited degree among segments of any population.

Further, Moore has a very limited understanding of the attitudes which Weber believed characterize modern capitalism. In dealing with France, for example, he quotes Forster's study of the nobility of Toulouse to prove that many of the provincial nobility were characterized by "thrift, discipline, and strict management," as well as a powerful desire to increase their wealth. (51.) As Moore sees it, this shows that their attitudes were the same as those described by Weber as constituting the Protestant ethic. The only difference between the French nobility and the English gentry was that the former, instead of rationalizing their estates, "used the prevailing social and political framework to 'squeeze more grain out of the peasants and sell it.'" (53.)

¹¹ See Reinhard Bendix, *Max Weber: An Intellectual Portrait* (Garden City, 1962).

Whether or not this description of the French nobility is accurate, it does not support Moore's argument. Weber never argued that the desire to increase one's wealth or even the organized effort to do so was a peculiarly capitalist phenomenon. What differentiates the capitalist orientation from pre-capitalist orientations is not only its greater rationality in terms of organization, but also its emphasis upon mastery of the environment. Profit is the unintended consequence (and in some ways unwanted consequence) of this Calvinist drive toward mastery, toward changing the external world through labor. Thus profits based primarily on colonial or fiscal exploitation, on the basis of force guaranteed by political authority, i.e., continuous earnings through compulsory payments, or various methods of tax-farming, are considered by Weber to be part of pre-capitalist economic structures.¹²

Indeed a good many scholars have pointed to just the characteristics Moore describes, in contrasting both the French aristocracy and the bourgeoisie with their English counterparts before and after the Revolution. Their point is that French attitudes remained pre-capitalist in so far as they were not innovative.¹³ Forster himself is careful to point out that the limited sample of provincial nobles he studied had made very few efforts to follow the English example of exploring new techniques for raising the general level of productivity.¹⁴

Moore's attack on Weber is less than successful. It remains to be seen whether or not the application of his own frame of reference to the countries studied is more adequate than one derived from a Weberian model.

III. THE WESTERN CASE STUDIES

The assumptions which guide Barrington Moore's analysis reveal themselves only grad-

¹² Bendix, *op. cit.*, 53.

¹³ See, for example: Bert F. Hoselitz, "Entrepreneurship and Capital Formation in France and Britain Since 1700," in National Bureau of Economic Research, *Capital Formation and Economic Growth*, p. 311; David Landes, "French Entrepreneurship and Industrial Growth in the Nineteenth Century," in Barry E. Supple (ed.), *The Experience of Economic Growth* (New York, 1963), pp. 340-353; and George V. Taylor, "Non-capitalist Wealth and the Origins of the French Revolution," *American Historical Review*, 72 (January, 1967), pp. 469-496.

ually in his historical case studies, and it is to these we must now turn. My knowledge of the material varies widely with the countries involved, and my analysis will not be directed primarily at "disproving" his argument on the basis of the evidence, but rather on pointing up some of the contradictions in his analysis.

Moore's Western case studies are confined to England, France, and the United States, with briefer scattered references to both Germany and Russia. Although I will stress those aspects of Moore's work with which I disagree, I should note that the differences are only in emphasis, for much of what he says is part of a general scholarly consensus. However, as in most matters of social analysis, differences of emphasis often result in radically different conclusions.

England, to Moore, is a paradigm case of industrialization, and his chapter is designed primarily to prove three propositions. First, he attacks the notion that the English have some peculiar knack for settling social disputes peacefully. (4.) The relative peacefulness of English society in the eighteenth and nineteenth centuries was preceded *necessarily* by an outburst of violence in the seventeenth century. Without this violent revolution produced by intemperate and violent men, the later development of peaceful parliamentarianism would have been inconceivable. (20, 39.)

Second, the English civil war was essentially a contest between two societies based on differing economic systems, between the traditional aristocracy, and the commercially oriented gentry supported by urban commercial interests. (14-20.)

Third, the industrial revolution in England was accompanied by "massive violence exercised by the upper classes against the lower," (29.) which was not different in kind from that exercised by other "ruthless" elites during the process of industrialization.

Competent historians, of course, do not subscribe to a non-violent myth of English history any more than does Moore. The fact remains, however, that even the English Civil War was relatively mild by continental standards, something which Moore himself recognizes and attempts to explain. The Civil War aside, it is still the relative peacefulness of British evolution since the eighteenth century which poses the more interesting problem.

For his economic interpretation of the Civil War, Moore relies heavily upon Tawney's "rise of the gentry" thesis, a position which commands far less than universal support among English scholars today, including some of those

he cites.¹⁵ Moore relies, too, upon an analysis of the geographic distribution of the opposing forces in the Long Parliament, noting, as have all previous commentators, that the more "commercial" sections of the realm generally supported the Parliament, while the more backward generally supported the monarchy. (510-514.) The problem lies in the fact that even in the areas supporting the Parliament, there was strong latent support for the king, and, further, these were the same areas in which the dissenting sects were strongest.¹⁶ Moore's case for a basically economic interpretation of the revolution, one which de-emphasizes religious and other factors, is not very strong.

Indeed Moore seems to be in a quandary, for he admits in the end that the Civil War did not result in the displacement of one class by another. Its major contribution to bourgeois democracy seems to have been the killing of an English king—a killing which served as a stern reminder to later monarchs. (18, 17.)

The killing of the king, of course, was a political rather than an economic act. It is not clear why it should have been so traumatic. As Plumb and others have pointed out, this was far from the first king the English had killed. Down to the seventeenth century the English had something of a reputation as regicides.¹⁷ What caused the trauma? If, as Moore suggests, the Civil War did not produce a fundamental alteration in the class structure of the society, it is at least possible that the changing political culture of

¹⁵ He cites Lawrence Stone as more or less supporting Tawney's thesis. (*Origins*, 15). Stone, however, specifically rejects his own previously held belief in the key role played by such factors. Indeed, he calls for the replacement of economic interpretations of the Civil War by broader sociological interpretations, and argues that other factors, including religious factors, played a key role in the conflict. See Lawrence Stone, *The Crisis of the Aristocracy* (New York, 1967; Abridged edition), pp. 4, 7-9, 345-354.

¹⁶ See, for example, Ivan Roots, *The Great Rebellion* (London, 1966), pp. 62-68; Stuart E. Prall (ed.), *The Puritan Revolution* (New York, 1968), ix-xxii, and Charles Wilson, *England's Apprenticeship* (New York, 1965), pp. 108-140.

¹⁷ J. H. Plumb, *The Growth of Political Stability in England* (London, 1967), p. 19. In the 200 years before Henry VII established the Tudor dynasty, England had been ruled by twelve monarchs. Only three reigned until death overtook them. Of the remaining nine, seven were deposed, five of whom lost their lives by violence, and two went insane.

English society played some role, and that religious factors played at least as important a role in these changes as did economic.

No one seriously doubts the importance of economic factors in explaining changes in political and other values in England and elsewhere, but the evidence indicates that religious and constitutional issues were at least as significant, and were not merely dependent variables. Wide agreement had been reached in the Long Parliament on purely economic issues; it was the political and religious question, as well as Charles' personality, which ultimately produced the conflict.¹⁸ It is hard to believe that the English Civil War could have occurred without the political aggressiveness of the dissenting sects, and there is every reason to believe that another Monarch might have been able to escape with his head.¹⁹

There is little evidence that enclosures or the commercialization of agriculture were greatly accelerated by the Civil War itself, and, in any event, the dissenting sects were rather more favorably inclined to enclosure than other religious groups.²⁰ I should note that while Moore sometimes sees the Civil War as opening the floodgates to enclosure, he offers no evidence for this assertion, and at other times is quite willing to admit that the process was a gradual one until the late eighteenth century, to which we may now turn. (19, 25.)

Moore's analysis of English industrialization represents what must be called a "post-revisionist" position, in that he sharply criticizes those scholars who have tried to alter the traditional picture of the consequences both of enclosure and of industrialization. Before we analyze his attack in somewhat more detail, let us consider briefly the revisionist account of the changes which took place in late eighteenth and early nineteenth century England.

First of all, such scholars as Mingay, Jones and Thompson deny that the wave of enclosures which swept over England in the late eighteenth century served to break the back of the small peasant proprietor and to convert him into a rural or urban proletariat. They argue that

while the concentration of landownership by about 1830 was greater than in the seventeenth century, it was not much greater, and that the increase had been a very gradual one.²¹ In fact, while the enclosures of the late eighteenth century took land from some peasants, others received land. The evidence seems to indicate that the number of small owner occupiers actually increased for a short time.²² The proportion of agricultural workers to owners was about $1\frac{3}{4}$ to 1 at the end of the seventeenth century; 140 years later it had risen to only about $2\frac{3}{4}$ to 1.²³ The real source of the gradual decline in small holders was not enclosure, but the relative disadvantages of small-scale agriculture in an era of commercial farming.²⁴

Revisionist scholars argue further that enclosures did not depopulate the countryside. Instead the rural population actually increased during the period. In many cases the largest migrations took place from unenclosed areas, or areas which had been enclosed much earlier. The creation of an urban and even a rural proletariat was far more the result of the increase in population than it was the result of enclosures.²⁵

²¹ Some of the important works on the subject include: E. L. Jones and G. E. Mingay (ed.), *Land, Labour and Population in the Industrial Revolution* (London, 1967); E. L. Jones, *Agriculture and Economic Growth in England 1650-1815* (London, 1967); J. D. Chambers and G. E. Mingay, *The Agricultural Revolution, 1750-1850* (London, 1966); F. M. L. Thompson, "The Social Distribution of Landed Property in England Since the Sixteenth Century," *Economic History Review*, XIX, 3 (1966), pp. 505-517. A classic and much earlier "revisionist" analysis is J. H. Clapham, *An Economic History of Modern Britain* (Cambridge, 1926), I, pp. 98-142. See also B. H. Slicher Van Bath, *The Agrarian History of Western Europe* (London, 1963), pp. 318-321. The edited volumes contain some of the classic earlier studies which are the basis for much of the revisionists' case.

²⁰ W. E. Tate, *The Enclosure Movement* (London, 1967), pp. 143-153, and Wilson, *op. cit.*, pp. 141-142.

Further, they argue, all the evidence we have indicates that living standards for workers, both rural and urban, did not fall during the period of industrialization. Rather the picture is one of gradual amelioration interrupted by such things as the effects of the Napoleonic wars, bad harvests, et cetera. On the whole, real wages increased at about the same rate as the relatively slow growth of per capita national product. The evidence indicates that income may have been becoming rather more equally distributed among social classes during the whole period of industrialization. Certainly income inequality does not seem to have increased.²⁶

To be sure there was a good deal of suffering among certain groups as old skills became outmoded, or, especially in the south, because of a lack of labor mobility. Certainly the transition might have been made more easily and more humanely in a perfect world. But, the fact of the matter is that the great growth of urban centers and industrialization took place first in England, and in the early nineteenth century. It must be judged by these standards. The alternatives were mass starvation and migration as in Ireland or land hunger and migration to cities in which no jobs were available as in France. In both of these countries population increased during the eighteenth century, but industrialization did not absorb excess labor.²⁷ Moore conveniently forgets to point out that in France migration to the cities occurred without the benefit of massive enclosures.

Moore agrees with the revisionists that the dismal picture painted of the results of enclosures and early industrialization by radical historians was somewhat overdrawn, but insists, without offering any new evidence, that the radical case still stands in its broadest outline. His critique of the revisionists rests on three kinds of arguments which may, for want of better terms, be called "adjectival," "rhetorical" and "psychological." The "adjectival" argument turns on the tendentious use of key words. Thus

Movements in England, 1701-1831." It will be published in a forthcoming issue of *Explorations in Entrepreneurial History*.

²⁶ The best summary of the data is to be found in Phyllis Deane and W. A. Cole, *British Economic Growth, 1688-1559* (Cambridge, 1967, 2nd ed.), pp. 25, 27-28, 283, 301, and Lee Soltow, "Long Range Changes in British Income Inequality," *The Economic History Review*, XXI (April, 1968), p. 1729. Needless to say the issue is still fairly controversial.

²⁷ C. E. Labrousse, *La Crise de l'économie française à la fin d'Ancien Régime et au début de la Révolution* (Paris, 1943), xxii-xxiii.

when revisionists cite the lack of peasant resistance to enclosure in the nineteenth century as evidence for the fact that peasant hostility to enclosure was not that great. Moore, citing them, states that "... the old peasant community finally gave way and disintegrated." (28.) Or where some commentators might see the poor laws and other measures as a sign of the relative responsiveness of the English ruling classes to changes which were but imperfectly understood, Moore emphasizes the horrors of being forced to receive public assistance. He neglects to point out, of course, that however many people were on poor relief in the late eighteenth and early nineteenth centuries, evidence for the late seventeenth and early eighteenth centuries indicates that

At a conservative estimate, a quarter of the population could be regarded as permanently in a state of poverty and underemployment if not of total unemployment. This was their chronic condition. But when bouts of economic depression descended, the proportion might rise to something nearer a half of the population.²⁸

The rhetorical argument is simply that no matter how it occurred, the fact is that the peasantry was destroyed. An entire social class was eliminated. The psychological argument is tied in very closely with the rhetorical argument and is best summarized in Moore's own words:

... it still seems plain enough that, together with the rise of industry, the enclosures greatly strengthened the larger landlords and broke the back of the English peasantry, eliminating them as a factor from British political life. From the standpoint of the issues discussed here, that is, after all, the decisive point. Furthermore, for the "surplus" peasant it made little difference whether the pull from the towns or factories was more important than the push out of his rural world. In either case he was caught ... between alternatives that meant degradation and suffering, compared with the traditional life of the village community. That the violence and coercion which produced these results took place over a long space of time ... must not blind us to the fact that it was massive violence exercised by the upper classes against the lower. (28-29.)

This passage is based on a mis-statement of the facts, in so far as it ignores population growth and other causal factors. However, let us disregard that and analyze the other components of the argument.

First, to assert that the elimination of a class and its occupation is by itself evidence of "mas-

²⁸ Wilson, *op. cit.*, p. 231.

sive violence" is to blur key distinctions. Isn't it important whether the change took place suddenly or over a longer time? And doesn't it make a difference for peasants whether they were driven to the city or attracted to it? Common sense, I think, would urge that these considerations are of significance if we are concerned with the human costs of social change. According to Moore, after all, industrialization was both necessary and inevitable, and as with all major social changes it involved a good deal of pain. We can evaluate the relative costs in a moral sense (if at all) only in terms of the alternatives which were available at the time, and by comparison with other societies.

Migration to the cities undoubtedly involved degradation for some. That it took place gradually, and that peasants often went to cities not far from their homes probably made the transition less severe. Moreover it was younger people who most often left and they may well have gone to the city because of the wider opportunities it offered.

It is true that, in some cities at least, death rates probably rose with the initial spurt in population, but as Englishmen learned to cope with problems of sanitation, urban mortality began to fall rapidly, and continued to do so during most of the nineteenth century.²⁹ I suspect that this was a net psychological gain for all city dwellers. Further, there is at least some evidence that by the early nineteenth century, city dwellers were taller and healthier than their rural counterparts, as even a Marxist like Hobsbawm must admit.³⁰ The disorganization and despair supposedly characteristic of the new working class is based on unproved suppositions, and there is at least some evidence on the other side. Crimes of violence declined in England during the nineteenth century and sporadic riots were increasingly replaced by organized political and trade union activity.³¹ Isn't this perhaps a sign that leaving a condition which Marx described as "idiocy," the ability of these peasants turned workers to shape their own destiny was increasing?³² Isn't it also possible that the rela-

tive peacefulness of political activity on the part of the working class was related to gradually improving conditions, and to the general sense of responsibility which, as Moore sometimes admits, characterized both the English aristocracy and the English middle classes?

One more issue deserves consideration in dealing with England, both for its intrinsic importance and for later discussion. Moore is forced to ask himself why English capitalists did not have to engage in the kind of repression during the nineteenth century which he will describe as characteristic of other nations, and thus did not have to turn to the aristocracy for assistance:

Other capitalist tasks, such as the further disciplining of the labor force, English industrial leaders could carry on their own with a minimum of help from the state or the landed aristocracy. They had to do so because the repressive apparatus of the English state was relatively weak, a consequence of the civil war, the previous evolution of the monarchy, and of reliance on the navy rather than on the army (32.)

One detects here a conservative streak in Moore. It is almost as if institutional and cultural patterns once established have a life of their own. Indeed, to use Moore's own arguments, there is no reason that British industrialists should not have created a repressive apparatus if they felt the need for it. Actually Moore sometimes is forced to admit that conditions in England were improving during the nineteenth century, an improvement he ascribes to English industrial pre-eminence and imperialism, and also to "a strong current of *opinion* in favor of doing something to alleviate mass distress . . . which is traceable to England's historical experience. . . ." (34.)³³

Despite Moore's rhetoric we have come full

this from contemporary developments. Alex Inkeles, in an intensive study of urban migrants in Chile, and other countries, argues that the adjustment from rural to urban life and to the factory is not nearly so difficult as is sometimes imagined. Indeed urban factory workers from rural backgrounds not only regard their situation as an improvement over rural conditions, but, on most indices which have been used, are more able to cope with the world. The results of Professor Inkeles' work will be published in book form in the near future.

³³ The emphasis in the quote is mine. At one point much later Moore literally brings in the kitchen sink and relates British attitudes to England's whole historical tradition including the use of unpaid justices of the peace. See *Origins*, 444.

²⁹ See Deane and Cole, *op. cit.*, p. 131 and *passim*.

³⁰ E. J. Hobsbawm, *The Age of Revolution, 1789-1848* (New York, 1962), p. 28. His data is from Belgium, but one suspects that it applied equally well to England.

³¹ J. J. Tobias, *Crime and Industrial Society in the 19th Century* (London, 1967), pp. 22-50.

³² This is certainly the impression left by E. P. Thompson's *The Making of the English Working Class* (New York, 1966), despite his attempt to prove rather a different kind of case. See, for example, pp. 830-831. We have some hard data on

circle. In fact, English developments were relatively peaceful, going back even as far as the Civil War, and English industrialization, given the era and the options, was relatively humane.

* * *

To Moore the French Revolution destroyed a feudal regime which was slowly changing and created the basic institutions of a bourgeois capitalist society. (105-06.) The Revolution took the form it did because, for reasons which Moore does not really explain, the French gentry while becoming capitalist, directed their energies to milking the peasants rather than driving them from the land. (52.)³⁴ Whatever the costs of the Revolution it was necessary, even in its radical phases, for it produced a society superior by far to the old regime and prevented France from eventually going through a Fascist phase. (78, 104-5, 413.)

As with his English case study Moore's analysis is essentially "pre-revisionist." It is quite clear for example that by the latter part of the eighteenth century, only remnants of what might be loosely called feudalism remained in France.³⁵ It is also quite clear that the supposedly sharp line between bourgeois and aristocrat was actually far more permeable than has been thought. More important, there is little evidence of a sharp differentiation between the aristocracy and the bourgeoisie in their use of capital, their relation to the land, or their participation in commerce. Both groups, if we use the term loosely, were participating in "bourgeois" economic activities in much the same way, and, with exceptions, the economic activity of both groups combined some elements identified with a "capitalist" mentality as defined by Weber, and a pre-capitalist mentality.³⁶ Finally, it is quite clear that, at least in its early stages, the so-called bourgeois revolution was not initiated by the bourgeoisie, if we define the bourgeoisie in a narrowly economic sense. The leaders of the first moves consisted not of men of commerce but of professionals such as lawyers and bureaucrats of both a "bourgeois" and an aristocratic back-

ground. True, the bulk of the initiators were bourgeois, but only in the legal sense that they were not members of the aristocracy, i.e., the sense in which the term was used in the eighteenth century.³⁷

Moore admits some of this, and sometimes argues that the French Revolution was a bourgeois revolution not because it was caused by the bourgeoisie, but rather because it established a "capitalist" system of private property, and equality before the law. (105-06.)³⁸ This argument begs the basic question, i.e., the role played by changes in the system of production. Indeed, if the role of economic classes is not decisive, Moore's whole analysis falls apart, for then landed, non-commercial gentry can make a bourgeois revolution, and Fascism is not the inevitable outcome of the failure of the bourgeoisie to do so. Indeed Moore recognizes this. Throughout the chapter, as in other chapters, the emphasis is upon economic classes as the source of social change, except where it is inconvenient. (68-9 *passim*.)

It is impossible to know whether the terror was necessary for the partial victory of the "bourgeois revolution." Pace Moore, the radical phase of the Revolution contributed little to those basic changes in France's legal structure initiated from 1789-1791 and brought to fruition under Napoleon.³⁹ On the other hand the terror was one of a series of mechanisms by which the Revolutionaries were able to defeat their enemies at home and abroad.

It is also impossible to know whether a milder revolution or non-revolutionary reform would have resulted in a more pronounced "Fascist" phase in French life than she experienced. Moore's argument here depends upon his categories rather than any evidence he adduces. It might be well to point out, however, that while the Revolution did modernize the French legal system and uproot the old class system, paving the way for a more modern society, some of its

³⁴ His supposed explanation actually consists of a description of the differences between English and French gentry.

³⁸ If establishing equality before the law and a modern system of private property are the essential features of bourgeois democracy, then the restoration in Japan established a bourgeois democratic regime, something which Moore denies.

³⁹ The definitive study is Jacques Godechot, *Les institutions de la France sous la Révolution et l'empire* (Paris, 1951).

consequences inhibited later "capitalist" development. The very fact of Revolution and Napoleon's continental system were such that France had fallen much further behind England in terms of economic development by 1815 than she had been in 1789; some promising moves in the direction of free trade taken by the monarchy were dropped by the revolutionaries and Napoleon, and, more importantly, the creation of a large vested group of small peasant owners inhibited rather than aided the growth of commercial agriculture. Nor is there much evidence that the Revolution changed the attitudes of the commercial strata in the society. In fact, the mutual antagonism which characterized various social groups in the aftermath of the Revolution and the instability of French regimes, may have inhibited the development of a more dynamic entrepreneurial attitudes. In any event, French economic growth after 1815 was not any faster than under the old regime, and France did not begin to modernize until the late nineteenth century. In fact her economic structure remained highly traditional until the mid-twentieth century.⁴⁰ Nor did the Revolution really solve one of the major problems that had served to bring it about, i.e., the pressure of population on land. This problem was really solved (if this was a solution) by the peasants themselves, as they increasingly turned to birth control and the limitation of family size, a trend which had already manifested itself in the 1770's.⁴¹

Finally, in addition to the terror, French military casualties during the Revolution and the Empire are estimated at about 1,300,000 men, to which must be added those who died during famines which resulted from general disorder and military action.⁴² To all of this we must add the schism in French life produced by the Revolution—a schism which was at least partially responsible for the violence which characterized French life through most of the 19th and early 20th century, as well as the rapidity with which France collapsed during World War II. When Moore asks us whether we would have preferred

"moderate reform" to the Revolution, he neglects these results although he is quite willing to place in the balance all of the injustices of the old regime from time immemorial. (104.)

Even those who reject his neo-Marxism would agree that a Revolution like that which developed in France could not have occurred much before 1789. The real question, then, is, given a choice, which alternatives would have been the least costly? In abstract terms, it seems to me that gradual reform on the English model has much to be said for it.

Moore's analysis of the Revolution is unconvincing in its major dimensions. I certainly would not deny the role of the economic changes which were taking place in France in creating pressures for a restructuring of the society. Perhaps my major disagreement with him lies in my willingness to consider as key factors the ideas of the Enlightenment, and the example of England, as these undermined the legitimacy of traditional French society. It was this conjunction of ideological and cultural variables, together with economic changes, which was responsible for the unique development of modern Europe.⁴³

* * *

Moore's scattered references to Germany are designed to demonstrate that the failure of a bourgeois revolution and resulting modernization from above led to National Socialism. He never tells us why this should have been so, aside from a few remarks on the irrationality of the German economy. (442.) nor does he satisfactorily explain why the German bourgeoisie failed to create the kind of modern capitalist state which would not have succumbed to totalitarianism.

According to Moore, the bourgeoisie needed the aristocracy if Germany were to be unified and the German working class kept in its place. Not only did they support the aristocracy; they also adopted their life style and values. (36-7, 34, 437.) But why couldn't the German middle classes have supported the aristocracy and retained the "bourgeois" values which their economic position should, theoretically, have impelled them to adopt? By what mechanism is the rational acceptance of the leadership of one class by another transmuted into the acceptance of their values? Why could not the German bourgeoisie merely have accepted the leadership of the aristocracy, until the state had been unified and they were no longer needed,

⁴⁰ For references on this point, see the sources cited in footnote 37. See also Cobban, *op. cit.*, pp. 68-80, Alexander Gerschenkron, "Reflections on Economic Aspects of Revolutions," in Harry Eckstein (ed.), *Internal War* (New York, 1964), pp. 180-204, and Arthur L. Lunham, *The Industrial Revolution in France* (New York, 1955), pp. 3-13.

and then dispensed with their services?⁴⁴ It is at points like this that Moore's neo-Marxism becomes vulgar Marxism and begins to lose all theoretical coherence.

Moore's discussion of Germany flows into his American chapter. In summary his argument is that in 1861, the United States made a choice between an essentially English pattern and a German (or perhaps Russian or Chinese) one. The alternatives were revolution (the Civil War was the "last capitalist revolution"), or an alliance of Northern businessmen and Southern "Junkers." (115, 131, 153, 421.) Moore's explanation of why the alliance did not take place is out of step with much of the best recent scholarship on United States history. But it may be more important to ask whether the materials for an alliance even existed. If they did not, Moore has created an interpretation of the Civil War by posing a false pair of alternatives.

No evidence exists pointing to a possible Northern business and Southern Junker alliance at any time before the Civil War. Neither before nor immediately after the Civil War was there a cohesive business community drawn into supporting common policies by a need to control or a fear of a "radical" working class. Businessmen split widely on every major issue that arose during the whole period, from banking to cheap money, to the tariff, the last of which is central to Moore's argument.⁴⁵

The dual program of cheap land and high

"We may also ask why the German working class was so much more of a threat to the German bourgeoisie than the English working class was to the English middle class? Despite the rhetoric, they were not notoriously more violent. And if the relatively mild rhetoric of British working class leaders is to be explained by rising living standards, as Moore suggests, why didn't this have the same effect on German workers whose real wages almost doubled between 1870 and 1914? See Ashok V. Desai, *Real Wages in Germany, 1871-1913* (Oxford, 1968), p. 36.

⁴⁵ Robert Sharkey, *Money, Class and Party*, Baltimore, 1967), discusses the Reconstruction period in some detail and reviews the general literature. The book is but one of a series which have succeeded in demolishing Charles Beard's portrait of Reconstruction beyond repair. On the Tariff question see Richard Hofstadter, "The Tariff Issue on the Eve of the Civil War," in Gerald D. Nash, *Issues in Economic History* (Boston, 1964), pp. 50-55, and David Montgomery, *Beyond Equality* (New York, 1967), pp. 64-65. On the bank issue see Bray Hammond, *Banking and Politics in America from the Revolution to the Civil War* (Princeton, 1954).

tariffs which, according to Moore, forged the economic alliance between the North and the West owed a good deal to the attempt by the Republican party to develop a majority by appealing to a wide variety of groups on the issues which were most salient to them. Moore finds it strange that Northern business never thought to marry the issues which they were supposed to be concerting to marry, and that it was left to "politicians and journalists" to do so. (125-28, 130.) It is only curious if one assumes that political parties are merely epiphenomenal, and that all social policies must be explained in purely economic terms.

The one constituency which supported both free land and higher tariffs was not Northern business, but rather the same elements who provided the "radical" core of the Republican party—small businessmen and farmers. Both groups were wedded to the idea of building a powerful America composed primarily of small property owners, and also saw both the tariff and cheap land as contributing to these goals.⁴⁶

Moore's attempt to differentiate between the North and the South on the basis of their economic systems (contrasting Capitalist systems) is no more successful. It is true that slavery was partly an economic institution, and that the origins of slavery must be sought in economic variables. But unless one assumes that slaves were notably more efficient than free labor, or that only Negroes could effectively work plantations, the fact that Negro slavery came to characterize Southern agriculture, and that the South fought so hard to retain it, cannot be explained by economics alone. On purely economic grounds, there was little reason for southern Americans to refuse to accept the kind of sharecropping arrangements which Brazilians found relatively easy to consider and which, in fact, they ultimately came to themselves in the aftermath of emancipation. In short, racism was a key variable.⁴⁷

We may ask, too, how closely the southern plantation owner resembled the Junker. While social mobility in the South was probably lower than in the North, class lines in the white community were considerably less sharp than in Europe. Indeed the South had accepted universal white suffrage, and Southern politicians had to

⁴⁶ This is the general thrust of W. R. Brock's analysis in *An American Crisis: Congress and Reconstruction, 1865-67* (New York, 1966).

⁴⁷ Winthrop D. Jordan, *White Over Black* (Chapel Hill, 1968). Jordan proves fairly conclusively that negative attitudes toward Africans preceded the establishment of slavery, and were a key factor justifying it in the minds of English settlers.

take into account this constituency. The presence of the blacks also served to reduce social class distinctions between whites.⁴⁸ Further, as Moore points out, the Junker used the German peasant as an ally in order to maintain his position. (38.) If the Negro was, as Moore also argues, the only group in the United States resembling a conventional European peasantry, it is extremely difficult to conceive of an alliance of this kind ever developing. (111.)

Finally, if it was the North's economic system which produced anti-slavery feeling, one would expect to discover some correlation between type of economic activity and abolitionist sentiment. Moore tries to find this in the family farm in the North (although he is not sure why the same feelings are not produced by family farming in the South). (129.) The evidence belies this. Opposition to the extension of slavery among yeomen farmers in the North was often based on anti-black feeling.⁴⁹ On the other hand, if we look for the sources of abolitionist sentiment, the key factor seems to be religious. Abolitionists come in substantial numbers from radical Protestant backgrounds.⁵⁰

The assumption that Northern businessmen would have deferred to the leadership of Southern "Junkers" to produce a "German" solution to industrialization if the Civil War had not occurred is absurd. It does not tie in with our picture of the South or of the country in general. Did the North need the Southern Junker in order to create a national state? Did Northern businessmen emulate the life style or culture of the Southern gentry? On the contrary it was they who felt self-confident and the Southerners who felt on the defensive. One of the reasons that the Civil War came when it did was that Southern militants correctly believed that the balance of power was tipping rapidly in favor of an increasingly powerful industrialized North, and that, given ten or twenty years more, the South would be overwhelmed with ease. To talk of a German solution to industrialization in America is a little like assuming that it is the tail which wags the dog.⁵¹

⁴⁸ See the discussion in W. J. Cash, *The Mind of the South* (New York, 1941), pp. 31-43.

⁴⁹ Eugene H. Berwanger, *The Frontier Against Slavery* (Urbana, 1967).

⁵⁰ David Donald, *Lincoln Reconsidered* (New York, 1961), pp. 19-36.

⁵¹ On the relative position of the North and South see Peter d'A. Jones, *The Consumer Society* (Baltimore, 1965), pp. 127-128. That the South faced a crisis of which this factor was part, is pointed out by Eugene D. Genovese, *The Political Economy of Slavery* (New York, 1967). Nevins

Nor is Moore on firmer ground in arguing that Reconstruction was liquidated by the creation of an alliance between Southern ex-Junkers, and northern businessmen, so fearful of nascent radicalism in the North that they were willing to leave the Negro to his fate. Woodward, whom Moore cites for this, offers little or no proof of the assertion in his book, which deals with the compromise of 1877. Rather, a reading of the volume indicates that the compromise, aside from particular political-economic gains for both sides, was forged largely because of a fear of renewed sectional violence.⁵²

In fact, the evidence points the other way. The Republicans abandoned the Negro because they had become self-confident enough to believe that they no longer needed his votes, and because the passions aroused by the Civil War had died away.⁵³ The failures of Reconstruction are to be laid to the continuing racism which characterized American society, and to the limitations of the very liberal ideology which was so instrumental in producing the crusade against slavery.⁵⁴

IV. THE ASIAN CASE STUDIES

While Moore recognizes some of the difficulties of comparing European and Asian countries, he is convinced that the categories he has developed are universally applicable and his discussions of China, Japan, and India are intended to round out both his theoretical and his moral case.

China's failure to break through to a modern society, Moore argues, stemmed not from cultural limitations or institutional structure but from concrete class interests. The Chinese gentry, rather than turning their efforts to raising productivity, preferred to increase their

certainly implies that this was one of the reasons for the militancy of at least some Southerners. See the selection from his *Ordeal of the Union*, Vol. I, in Edwin C. Rolywine, *The Causes of the American Civil War* (Boston, 1961), pp. 200-216.

⁵² Indeed Woodward himself lists this as the key factor in the compromise. See C. Vann Woodward, *Reunion and Reaction* (Boston, 1951), pp. 13-14.

⁵³ Sharkey, *op. cit.*, points out the difficulty of uncovering a unified capitalist versus agrarian or worker position during the period. He is supported in this by Montgomery, *op. cit.*, and Irwin Unger, *The Greenback Era* (Princeton, 1964). Both of the latter stress the importance of ideological as well as economic variables.

⁵⁴ See Brock, *op. cit.*, especially pp. 274-304. See also Stanley P. Hirshon, *Farewell to the Bloody Shirt* (Bloomington, 1962), and Kenneth M. Stampp, *The Era of Reconstruction* (New York, 1966), especially pp. 186-215.

wellbeing by squeezing still more out of the peasantry. (179-80.) In the last analysis the only alternative to a Communist revolution was a quasi-Fascist road to modernization, although, because China was at a relatively early stage of development, this did not take quite the same form as it did in Europe. (196-7, 178.)⁵⁵

Moore's strictures against arguments which explain some of the differences between the West and China on cultural grounds are quite similar to those which he has used before. There is evidence that by the nineteenth century the Chinese were willing to turn to Western technology; the gentry were willing to engage in commerce, and all the right attitudes were available, though perhaps latent. (179.) Ultimately, however, the landed gentry controlled the state, and it was easier to increase the population and exploit peasants than to turn to methods designed to expand production. Why it should have been easier to operate in this fashion, Moore does not tell us, except to assert that "... there was no rapidly growing urban population with at least moderately diffused and increasing prosperity that could act as a stimulus to rationalized production for the market." (*Ibid.*)

The argument is unconvincing. Urbanization and moderately diffused prosperity may be a requisite for economic growth (the English gentry, then, were not that exploitive), but China had had both at various periods, including what, in some ways, was a highly developed system of commerce.⁵⁶ It is hard to escape the feeling that

⁵⁵ Moore is a little more cautious. He points out that the Kuomintang resembled European Fascism in a number of interesting ways. However, the general thrust of his argument is clear.

⁵⁶ According to Rhoads Murphey, large cities were proportionately more numerous in China than in Europe until the nineteenth century, and until the eighteenth century urbanism may have been higher. He argues that as much as a quarter or more of the population lived in towns and cities of more than 2500 population and perhaps 10 or 15 per cent in cities over 10,000. Most cities or towns of more than 5,000 had well defined commercial or manufacturing districts, and special areas for each important enterprise. These only represent educated guesses, but I gather that the order of magnitude is accepted as correct by most scholars in the field. See, "The City as a Center of Change; Western Europe and China," *Annals of the Association of Geographers*, LIV (1954), p. 354. Incidentally, in dealing with Japan, Moore drops the requirement of "moderately diffused and increasing prosperity." The key factors in Japan were peace and luxurious display on the part of the nobility (*Origins*, 234-235.)

cultural as well as institutional factors played a significant role in inhibiting Chinese development. Mary Wright, whom Moore cites to support his view that the restoration monarchy could not raise adequate revenues lest it alienate the gentry class, actually argues a quite different case. The regime's failure lay basically in its inability to conceive of efficient ways of using available resources because its institutional structure was based on Confucian precepts. The Japanese monarchy could restructure the economy because the loyalty of the gentry was to a given monarchy and a given nation. In China this was impossible because loyalty was to an institutionalized culture of a universalized type. (182-83.)⁵⁷ Moore denies that the Chinese gentry differed in kind from other aristocracies. He bases his case on the argument that since land was a key source of wealth, and wealth was a key source of acquiring bureaucratic position, the differences between the Chinese and other gentry were unimportant. (160-65.) But to paraphrase him, this is to confuse morphology with dynamics. In China potential entrepreneurial talent was diverted to the gentry scholar class through the examination system. In Japan, on the other hand, the fact that aristocratic status was hereditary and closely tied to the land may have been an important factor in the earlier development of an entrepreneurial class.⁵⁸

Chiang Kai-shek is both authoritarian and unattractive. It is less clear that he is a proto-Fascist. This is a key point, for Moore clearly uses Fascist as a scare word, evoking images of genocide. (304-05.) Let us try to deal with the issue. First, within the framework of Moore's own scheme, Chiang Kai-shek could not have established a Fascist regime. Fascism, after all, emerges only after conservative modernization has produced a series of fundamental economic

⁵⁷ Wright points out first that there were good economic arguments against increasing the tax on land, and, second, that there were other mechanisms available to the government which would not have alienated any major economic groups, but which it did not use. See Mary C. Wright, *The Last Stand of Chinese Conservatism* (Stanford, 1957), pp. 169, 186, 193. Moore and I must have derived a different meaning from the text, for he cites almost the same pages. Wright does not deny that the regime was limited in its power by various interests. The real question, however, is the relation between interest and ideology.

⁵⁸ Marion J. Levy, Jr., "Contrasting Factors in the Modernization of China and Japan," in Simon Kuznets (ed.), *Economic Growth: Brazil, India, Japan* (Durham, 1955), p. 523.

crises. China had not yet passed through such a phase. The point may seem a quibble, but it is extremely important, for if the Kuomintang regime was incipiently Fascist, then Fascism is not merely a later result of conservative modernization, and the whole dialectic of Moore's analysis is open to question.

What evidence does Moore offer? Chiang was an incipient Fascist, Moore argues, because he led a single party, which relied, in part, on a secret police apparatus; he used force to solve social problems; he was a nationalist; he urged moral regeneration rather than developing "realistic analyses" of Chinese problems, and he failed to discourage industrialization.

What do these arguments add up to? The leaders of many third world nations could be characterized in much the same way, including such diverse types as Bourguiba, Nasser, Sekou Touré, Nkrumah and Ayub Khan. To describe them all as latently Fascist or Communist would not seem to further political analysis.

Chiang's writings certainly lack detail on economic questions, but so have the writings of a good many modernizing oligarchs before they consolidated power. In fact, the regime did institute a good many legal and economic reforms between 1928 and 1937, and, it did encourage industrialization. Industrial growth in China between 1928 and 1937 is estimated at perhaps six to eight per cent per year.⁵⁹ If his regime made a fatal mistake in ignoring the problems of the peasantry, it demonstrated that it was capable of learning. Once on Formosa it initiated and carried through reforms based on the original Kuomintang program.⁶⁰

Chiang Kai-shek had not yet consolidated his power when the Japanese invaded in force, and his emphasis on building a modern military machine was based on a reasonable assessment of both Japanese and Communist intentions. His failure to press land reform was partly related to a feeling that the consolidation of power and national defense had first priority.⁶¹ Of course,

his control over local leaders actually decreased during the war itself.⁶²

His policy was clearly wrong. However, we do not know what he would have done had he consolidated his power. After all the Communists also subordinated agricultural reforms to the requirements of victory by downplaying collectivization, just as, at an earlier period, they had worked with the Kuomintang despite the "bourgeois" character of that party.

The creation by Chiang of a police state on the mainland and on Formosa can be explained, partially by the fact of very real opposition to his policies. On Formosa these policies include the fanatic desire to reconquer the mainland, a desire as pathetic as it is unreal. However, that a man nearing death should cling to the dream which has given his life meaning, says little about what his actions might have been under other circumstances.⁶³

Moore's critique of Chiang's emphasis upon the "excessive" individualism of the Chinese and his calls for moral regeneration is rather peculiar, in that he admits that the theme was not merely rhetorical, and is to be found in the writings of Sun Yat-sen. (208.) The same theme of moral regeneration finds its echoes, too, among the Chinese Communists, who are also relying upon moral rhetoric and compulsion to eliminate vestiges of "reactionary individualism."

Finally, as Moore points out in citing the evidence for the regime's incipient Fascism, Chiang argued against precipitant action and urged the importance of thinking correctly before acting. (198.) However, nothing could be further from Fascist doctrine, which urges the primacy of action over thought.

Whether Chiang Kai-shek could have succeeded in modernizing China at less cost than that exacted by the Communists or even at all we do not know. However, the description of his regime as incipiently Fascist does not really contribute to our understanding of either him or China.⁶⁴

Moore's chapter on Japan is a paradigm study of the relationship between "conservative modernization" and the emergence of Fascism. Given a Japanese bourgeoisie which was too weak to assert itself, conservative oligarchs took charge of the modernization process. The industrialization which followed was characterized by repression, with the masses being kept at a subsistence level. After 1925 the evils of the system became apparent to everyone, and Japanese businessmen, unable to create a vigorous internal market, because it would have threatened their exploitive paternalism and their profits, joined with the military to create a Fascist regime. (290-91, 299-300, 3043-5.) The ultimate result was Pearl Harbor. Japan had escaped the horrors of radical revolution only to create greater horrors for herself. As Moore puts it, comparing Japan to China:

A hundred years from now, or perhaps in much less time, the partial nature of Japan's social and industrial revolution, especially the very limited "revolution" of the Imperial Restoration in 1868, may seem to be the essence of Japan's tragedy. . . . On the other hand, contemporary Chinese society, despite severe difficulties and setbacks, shows signs of moving ahead. By learning from Soviet mistakes, China could conceivably surpass Russia. (229-230.)

Moore's analysis of the sources of Japanese economic growth in the pre-Restoration period is unconvincing. If, as he argues, Chinese and Japanese landlords were equally exploitive in intention, and neither contributed in any way to such growth, wherein lies the difference between the two societies? Certainly late seventeenth and eighteenth century China, as Japan, was characterized by both peace and luxury; why did nothing comparable to Japanese development occur? Moore's discussion offers us no clues, unless the Japanese landlord was not as clever as his Chinese counterpart.⁶⁵

How repressive was post-Restoration Japan?

creased substantially, except around a few large cities, and that the Communists established their strongest and most important bases in areas of relatively low tenancy. See Roy Hofheinz, "The Ecology of Chinese Communist Success: Rural Influence Patterns, 1923-1945," in A. Doak Barnett (ed.), *Chinese Communist Politics in Action* (Seattle: University of Washington Press, 1969), pp. 3-77. His analysis is confirmed in an exhaustive study by Dwight H. Perkins. See his *Agricultural Development in China 1368-1968* (Chicago: Aldine Publishing Company, 1969).

⁶⁵ Compare footnote 56.

If Moore wants to make a case for the "repressiveness" of the Japanese process of industrialization, he must demonstrate that the new regime was more repressive than the old, or that it was more repressive than comparable Asian societies of the period.

It is difficult to support either proposition. While Japan's progress until 1930 was uneven, it was moving in the direction of greater openness. That large numbers of people remained wedded to a traditional outlook is beside the point. A legal system had been created which established relative equality before the law by eliminating feudal privileges; both education and social mobility were rising sharply; the masses were slowly being drawn into the political process, and new ideas were reaching ever larger numbers of people through the press and in the universities.⁶⁶

Moore's contention that the great mass of the population benefited little if at all from industrialization is not supported by the evidence. Indeed the only data he offers are references to an article by Ohkawa and Rosovsky, and to Allen's *A Short Economic History of Japan*, to the effect that Japan was forced to import increasing amounts of rice. He also cites Allen to prove that *per capita* consumption of rice fell after 1925. (289.) Actually, he misreads Allen's figures, for the table cited shows *per capita* consumption of rice rising between 1925 and 1929 and only falling after that year.⁶⁷

It is true, as Allen points out, that Japan did import increasing amounts of rice beginning after World War I, in part, because Japanese agriculture could no longer advance as rapidly as previously within the existing agricultural framework. However, Allen adds, (and Moore fails to mention), that (1) Japanese population was increasing rapidly during this period. (2) It seemed wiser to grow rice more cheaply in Korea and Taiwan and diversify agriculture on the mainland.⁶⁸ Allen's figures show that rice consumption had been rising steadily since 1880. Since the transition to military rule and Fascism came in 1932, according to Moore, it seems a rash judgment to assert that three years of declining consumption are proof that 50 years of steady progress was a "short range success" which had already begun to display its "dubious side," and that now "the evils of the system had become apparent to everyone," especially when

⁶⁶ Fairbank, Reischauer, and Craig, *op. cit.*, II, pp. 513-578.

⁶⁷ The table (X) appears on page 201 of Allen's volume.

⁶⁸ G. C. Allen, *A Short Economic History of Japan* (London, 1962, 2nd edition), p. 116.

one remembers that the period of decline was partly the product of a world-wide depression. (289, 297.)⁶⁹ Japan's agricultural problem was not different from that of some other nations which lacked a traditional landlord class, nor is it true to assert that Japan's oligarchs were unwilling to create "a vigorous internal market." (290, 298.) As Allen indicates, almost eighty per cent of domestic production was for the internal market.⁷⁰

Thus far, I have only relied on sources which Moore cites. Other materials are available which demonstrate that despite a rapid growth in population, the general standard of living rose for the great bulk of the Japanese population. In fact, it rose about as rapidly as the per capita increase in gross national product for most of the period, and it rose more rapidly for peasants than workers in the period before World War I.⁷¹ While per capita consumption of rice

⁶⁹ One wonders who "everyone" was, given the fact, as Moore himself notes (*Origins*, 300), that right wing parties received only a small percentage of the vote in the 1936 elections. He fails to point out that relatively moderate pro-system parties captured the overwhelming bulk of the popular vote in 1932, 1936, and 1937, and that left wing parties were also quite small. See Robert Scalapino, "Elections and Political Modernization in Japan," Robert E. Ward (ed.), *Political Development in Modern Japan* (Princeton, 1968), pp. 249-92. Since this essay was originally written, I have come across a very useful article on the subject by George M. Wilson. See his "A New Look at the Problem of 'Japanese Fascism,'" in *Comparative Studies in Society and History*, X (July, 1968) 403-412.

⁷⁰ Allen, *op cit.*, pp. 159, 213, 224. Indeed Japanese prosperity in the postwar period indicates that democracy and reform are quite compatible with high profits.

⁷¹ Alan A. Gleason, "Economic Growth and Consumption in Japan," in William W. Lockwood (ed.), *The State and Economic Enterprise in Japan* (Princeton, 1965), pp. 391-444. Gleason presents evidence which indicates that from 1890-1925 real consumption *per capita* rose somewhat more rapidly in Japan than in the United States. Some scholars have recently challenged the traditional picture of Japanese economic growth, claiming that living standards before the restoration were higher than is generally assumed, and, thus, subsequent growth was slower. I am in no position to come to any final conclusion on this, but Rosovsky's suggestion that the overall picture is not radically altered seems reasonable. See Henry Rosovsky, "Rumbles in the Ricefields: Professor Nakamura vs the Official Statistics," *The Journal*

fell between 1929 and 1932, per capita consumption of all foodstuffs did not fall but remained at 2,300 calories a day. As Gleason notes:

A postwar FAO study reported that when climate, body weights, age and sex composition of the population are taken into consideration, the estimated daily requirement per person in Japan is only 2,300 calories. If we accept this estimate as applying to earlier decades, then we may conclude that by 1926 Japan had reached an adequate level of food intake in terms of calories and that this, rather than population pressure, accounts for the stability of the intake during the following decade.⁷²

The Japanese economy faced serious problems in the 1930's, problems which stemmed in part from her social structure, in part from the international environment, and in part from the rapidity with which a country with limited natural resources had industrialized. Nevertheless all sections of the population had benefitted from economic growth.

Moore's assertion that big business was one of the main props of Fascism is equally unsupported. The decade of the 1920's, when business seemed to be moving toward domination, was a period during which Japan moved away from her previously imperialist policies; and during the 1930's business, although split, was less sympathetic to imperialist activities than many other groups.⁷³

Moore establishes his case by definition. Since the military elite could not do without big business, then big business must have been part of the coalition which supported Fascism. By this logic, any government which had come to power, except for a Socialist government, would have been the one at least partially engineered by big business, whatever the attitudes of business to-

of Asian Studies, XXVII (February, 1968), 347-360.

⁷² Gleason, *op. cit.*, pp. 402-403. In fact rice consumption per head has continued its decline in the postwar period as the Japanese have shifted to other foods, a pattern which began in the 1920's. It is this shift rather than a sudden decline in living standards which probably explains the data cited by Allen. For example Japanese consumption of meat increased 400% in the period between 1892-1896 and 1923-7. *Ibid.*, p. 401.

⁷³ For example, William W. Lockwood, *The Economic Development of Japan* (Princeton, 1954), p. 76; Reischauer, Fairbank, Craig, *op. cit.*, II, pp. 510-511; William W. Lockwood, "Japan," in D. A. Rustow and Robert E. Ward (eds.), *Political Modernization in Japan and Turkey* (Princeton, 1964), pp. 129-131.

ward it. The same logic can be, and is, used to prove that the Labor government in England came to power in 1945 as a result of its willingness to enter into a coalition with big business, as did the New Deal in the United States. The argument is on a level with one that asserts that the United States is ruled by clerks because all governments have been forced to rely on them.⁷⁴

German Fascism was based on a mass party which did draw upon anti-capitalist sentiment. No such party of any real size developed in Japan. To assert that genocide comparable to the Nazis' destruction of the European Jews did not occur in Japan only because capitalism was not sufficiently advanced seems to me a very dubious proposition. (304.) Dominant religious, racial, and ethnic groups have been committing genocide against other groups under all sorts of regimes down through human history. An understanding of the behavior of the Nazis *viz a viz* the Jews must take into account the whole complex relation between Jews and Christians in Europe.

I see little reason to ascribe Japanese imperialism solely to her peculiar economic problems. It is far more easily explained by the emergence of Japan as a nation in an international environment characterized by imperialist nationalisms, and a nationalist tradition of her own which probably finds its ultimate roots in her relation to China. To be sure, the nationalist drive was exacerbated by Japan's dependence on Foreign markets, given the nature of her industrialization, the depression, and the often hysterical reaction of European nations to supposed threats of inundation by Japanese goods. World War II was a tragedy for Japan but certainly not a greater one than France's imperialist adventure during the Napoleonic period, which, to use Moore's logic, must be seen as a natural outgrowth of the French Revolution.⁷⁵

* * *

Moore's Indian case study is his last, and in some ways his most interesting. India has had no bourgeois revolution, nor has it taken the conservative or Chinese road to modernization. Rather the effort has been to raise the standard of living of the Indian people through moderate social reform within the framework of relatively

⁷⁴ It could also be used to prove that Japanese democracy today is based on big business for the same reasons.

⁷⁵ In fact, given the population and weapons differentials which characterized the nations and the periods, it may have been rather less of a tragedy if we, as Moore seems to, take the number of people killed as our index.

democratic institutions. Thus far the effort has been less than successful, for growth has been slow and almost universal poverty and degradation are the norm. However, the full story has not yet been written and the future is somewhat open. Moore's chapter tries to determine why India chose the road it did, and attempts to evaluate the policies which have been followed.

Moore's analysis of traditional India is based on an examination of the Mogul Empire. He concludes that there were no real signs of incipient industrialization before the British arrived, and leaves the strong impression that Indian society was both far less developed and far more exploitive than either China or Japan. He attributes its failure to develop a surplus to two factors. First, the property of all members of the society could revert to the sovereign upon the death of its owner. The result was an emphasis upon lavish display during one's lifetime. Second, Mogul taxation of the peasant was a fixed proportion of the crop, rather than, as in Japan, a fixed assessment on the land, a practice which discouraged effective cultivation. (328, 333.)

Moore gives relatively little weight to religion or the caste system as a block to development. Caste did render central government superfluous, and inhibited the formation of an alliance of dissident aristocrats and peasants comparable to that which developed in Japan. (353.) However, this was, in the last analysis, of secondary importance. (355.) As for caste itself, its ability to survive for so long is probably due to its very diffuseness, and its origins are to be found in human nature:

Human beings in a wide variety of civilizations have an observable tendency to establish "artificial" distinctions. . . . Children elaborate artificial distinctions all the time in Western society. . . . The reason for this tendency toward snobbishness—highly developed in some of the most "primitive" societies—is not easy to perceive. Though I cannot prove it, I suspect that one of the few lasting and dependable sources of human satisfaction is making other people suffer and that this constitutes the ultimate cause. (338.)

While the British presence was not as exploitive as some Indian nationalists have charged, it inhibited development. The British imposition of law and order favored those who had property; their attempts to create an independent class of peasant farmers failed; they did not turn economic surpluses into industrial plant; and, most important, their presence precluded both the Japanese and Chinese approach to modernization. (345-47.) Rather, energies

which might have been turned in other directions were fused in a nationalist attack upon British rule. The fusion took place in the person of Gandhi, who was able to unite the urban bourgeoisie and the peasantry into one movement. Both he and the Congress Party appealed to commercial interests because his attacks on the British and thus the landlord class which their rule benefitted, were combined with support of the institution of private property. (371, 373, 377, 378.)

Since independence, India has made little progress. Relying on Gandhi's ideology, the government has emphasized programs based on the "felt needs" of the peasants, and has not broken the control of the upper classes in the villages. (392-3.) The fault lies primarily with Nehru, who refused to act decisively although he had much more political leeway than is commonly assumed. (407.) For the future, growth can be achieved by:

allowing the upper strata in the countryside free rein, but taxing their profits and organizing the market and credit mechanism in such a way as to drive out the moneylender. If the government in this way succeeded in tapping the present surplus generated in agriculture and encouraging the growth of a much bigger one, it could do a great deal more about industry on its own resources. (409.)

Alternatively the government could:

. . . go over to a much wider use of compulsion, more or less approaching the communist model. Even if it could be tried in India, it seems highly unlikely that it would work. Under Indian conditions for a long time to come, no political leadership—no matter how intelligent, dedicated and ruthless—could . . . put through a revolutionary agrarian policy. The country is too diverse and too amorphous still. . . . The administrative and political problem of forcing through a collectivization program against the barriers of caste and tradition in fourteen languages seems too formidable to require further discussion. (409.)

In conclusion:

Either masked coercion on a massive scale . . . or more direct coercion approaching the socialist model will remain necessary. (410.)

For, as Moore argues at the beginning of the chapter:

Political democracy may seem strange in both an Asian setting and one without an industrial revolution until one realizes that the appalling problems facing the Indian government are due to these very facts. (314.)

Moore's analysis neglects almost completely one aspect of India's historical development which differentiates it sharply from China and Japan—the fact that India has yet to develop what both of these countries developed a long time ago, social and political cohesion on a national scale. Historically, the very heterogeneity of the sub-continent must be regarded as an important source of her relative lack of development.⁷⁶ India has known only one period of political unity, and the relatively short lived Mogul Empire never covered the whole country. Even within the boundaries of the Empire the administrative unity developed cannot be compared to that of China.⁷⁷ If Moore is willing to cite the diversity of India as a serious impediment to any program of reform today, it certainly must be included as a key factor in the past. Nor does Moore touch at all upon ecological problems—India's resource base and the problems of a tropical agriculture dependent upon the monsoon. While such variables are less and less important in the modern period, it seems unreasonable not to deal with them in describing differential development in a pre-industrial past.⁷⁸

Moore's discussion of the origins and development of caste is equally unsatisfactory. The fact that caste is eroding today under the impact of economic change says nothing about its effect on economic development at an earlier period, and Moore's analysis of its origins in the cupidity of human nature fails to explain why human viciousness took the peculiar form it did in India. One wonders, too, why the particular method of exploitation characteristic of India, i.e., taking a fixed portion of the crop, should have so inhibited the development of a surplus; after all, the absolute amount available to the peasant would have grown if his productivity increased. Even if Moore's argument is correct, why was the equally exploitive Japanese ruling class so stupid as to fail to see the advantages of adopting Indian customs in determining their share of peasant efforts? One wonders, too, why Chinese rulers failed to latch on to a custom of expropriating wealth with death along the lines followed by Akbar?

The weakness of Moore's argument becomes

⁷⁶ A. L. Basham, *The Indian Sub-Continent in Historical Perspective* (London, 1958).

⁷⁷ The point is made by Moreland, upon whom Moore relies quite heavily, See W. H. Moreland, *India at the Death of Akbar* (London, 1920), p. 4.

⁷⁸ Morris D. Morris, "Towards a Reinterpretation of Nineteenth Century Indian Economic History," *Journal of Economic History* (December, 1963), p. 609.

apparent in his treatment of British rule, for by his own analysis the British eliminated at least some of the mechanisms which had prevented the development of a surplus, and the only result, at least according to the author, was the continued growth of parasitic landlordism. It may be true that the overall effect of the British presence and the emergence of Gandhi, was to inhibit the development of either the Japanese or the Chinese alternative, as Moore argues. However, his case depends upon the acceptance of his categories, rather than on the evidence. It can be just as plausibly argued that if British rule had not provided a common focus for nationalist aspirations, and Gandhi had not appeared, the result would have been the complete fragmentation of the subcontinent. (446.)⁷⁹

I am not prepared to judge the efficacy of Nehru's policies. On Moore's own evidence their weakness lies not in the failure of the regime to break the power of the upper classes, but rather on its failure to develop intelligent programs. Moore does not accurately cite a single case study in which reform was blocked by the power structure of the village. He does cite several in which bureaucratic routine and an excessive idealization of traditional village culture resulted in failure. (400-403.)⁸⁰

Interestingly enough, this is the only case study in the volume in which, at various times, ideological commitment as against class interests is explicitly accorded substantial independent causal efficacy. Thus, British reforms in agriculture are laid to the ideology of the British, and Nehru's failures are laid to an idealization of the village and an unwillingness to rely on certain forms of compulsion.

Why does Moore suddenly reverse himself? Perhaps because India is the prime example of the failure of moderate reform. Here men of relatively good will have attempted to avoid various violent and repressive models, and have failed. Hence, Moore drops his neo-Marxism in dealing with India to make a policy point, namely that neither liberalism nor democracy can work in the developing countries. The lesson to be derived from the Indian case is quite

⁷⁹ Moore, in fact, suggests that one of the major reasons for the lack of development of a Hindu variant of Fascism is the fragmentation of the Hindu world along caste class and ethnic lines.

⁸⁰ To prove his case, Moore uses Rene Dumont, *Terres Vivantes* (Paris, 1961); Gough's essay in McKim Marriott, *Village India* (Chicago, 1955), and Alan R. Beals, *Gopalpur* (New York, 1962). None of them directly support his assertion and Beals states almost the opposite on p. 82.

clear. Despite some cautionary statements, Moore believes that the only two alternatives open for India are repression on the Japanese model and violent revolution of the Chinese type. Given his previous assessments of these alternatives, we can guess which he prefers. This brings us to the heart of the assumptions underlying his whole effort.

V. THE UNDERLYING ASSUMPTIONS

Moore's analysis does not establish either his substantive or his theoretical propositions. All industrialization has not been more or less equally violent and repressive; all ruling classes are not equally exploitive; and Fascism is not the necessary outcome of so called "conservative industrialization." If I have justified my initial assertion that Moore's perspectives were brought to rather than deriving from the materials with which he deals, we may now turn to a direct examination of these perspectives.

Toward the end of *Social Origins of Dictatorship and Democracy*, Barrington Moore states some of his assumptions in fairly clear form. The three paragraphs involved are worth quoting in full:

For a Western scholar to say a good word on behalf of revolutionary radicalism is not easy because it runs counter to deeply grooved mental reflexes. The assumption that gradual and piecemeal reform has demonstrated its superiority over violent revolution as a way to advance human freedom is so pervasive that even to question such an assumption seems strange. In closing this book I should like to draw attention for the last time to what the evidence from the comparative history of modernization may tell us about this issue. As I have reluctantly come to read this evidence, the costs of moderation have been at least as atrocious as those of revolution, perhaps a great deal more.

Fairness demands recognition of the fact that the way nearly all history has been written imposes an overwhelming bias against revolutionary violence. Indeed the bias becomes horrifying as one comes to realize its depth. To equate the violence of those who resist oppression with the violence of the oppressors would be disleading enough. But there is a great deal more. From the days of Spartacus through Robespierre down to the present day, the use of force by the oppressed against their former masters has been the object of nearly universal condemnation. Meanwhile the day-to-day repression of "normal" society hovers dimly in the background of most history books. Even those radical historians who emphasize the injustices of prerevolutionary epochs generally concentrate on a short time span preceding the immediate outbreak.

In that way, too, they may unwittingly distort the record.

That is one argument against the comforting myth of gradualism. There is an even more important one, the costs of going without a revolution. There have been the tragedies of the victims of fascism and its wars of aggression, the consequence of modernization without a real revolution. In the backward countries today, there continues the suffering of those who have not revolted. In India we have seen that this suffering has been in good measure the price of democratic slowness in the Asian context. . . . There are also positive arguments on behalf of revolution. In the Western democratic countries revolutionary violence (and other forms as well) were part of the whole historical process that made possible subsequent peaceful change. In the communist countries too, revolutionary violence has been part of the break with a repressive past and of the effort to construct a less repressive future. (505-506.)⁸¹

I do not know on what basis Moore arrives at these generalizations about Western scholars. The best historians are quite willing to describe regimes as exploitive when they feel that they are, and do not merely describe their problems on the eve of revolutions, or only condemn the violence of the "oppressed." They are rather less likely than Moore, however, to set up an absolute standard of exploitation. Rather they are inclined to evaluate regimes more or less within the context of the historical period, and with an awareness of both the cultural and technical resources available. Nor do they usually divide the historical actors categorically into oppressors and oppressed. Rather, they have a sense of history as involving tragic encounters among men equally caught up in their own limitations, and, in evaluating the outcome of revolutions, they attempt to balance losses against gains, and to criticize only violence which seems purposeless or unnecessary.

Moore's writing indicates that he is one of that generation of scholars to whom the Soviet Revolution once represented the hope of a radical transformation of mankind. Disillusioned by the results of that Revolution, he has now, with the mellowing of the Soviet regime, been able to

justify his earlier enthusiasm for it by arguing that it has been no more repressive than other alternatives. (31, 506.) And while he is no longer sure that a free non-repressive society can ever be created, he looks to new radical revolutions in the "third world" as embodying hope for the future. (508, and his remarks on China.) Indeed, while he talks of past revolutions in the West as having provided the opportunities for later peaceful change, he seems convinced that Western societies are becoming increasingly irrational, and that change may have to involve the repression of false ideas if we are to move on toward the goal of a compulsionless society. (442.)⁸² However, much he may talk about an objective standard of exploitation which may be used for purposes of historical analysis, it is also clear that his definition of exploitation derives from his conception of a free rational and compulsionless society. By this definition, of course, all historical societies have been exploitive, and his refusal to differentiate degrees of exploitation now makes sense. To a man standing on the moon the differences between mountains and valleys on the earth must seem rather insignificant. By these standards, all socialization is repressive.

In all of this, his neo-Marxism serves a useful function. After all, if men can learn, and if new ideas can change their behavior, then peaceful reform is possible. If, on the other hand, class interests deriving from the economic substructure of the society and acquisitive drives are the basic motivations in all historical systems, then change must be apocalyptic. Further, if history is the product of clashes between human beings who are caught up in cultural limitations, and who fight and die for ideas sincerely held, it is

⁸² Moore is very ambivalent on this question. See his essay in Robert Paul Wolff *et al.*, *A Critique of Pure Tolerance* (Boston, 1965). He is ambivalent on a number of other issues as well. On the one hand he feels that men are capable of discovering scientific truths which will enable them to create a more humane society. On the other he is not sure that enough men can learn quickly enough to avoid the necessity for revolution even in advanced countries. He is not clear as to whether it is their class position, their general selfishness or their ignorance (or stupidity) which is the key variable here. In *Origins* he gives not a single instance of men learning from past mistakes in such a way as to act more humanely for the general welfare, and yet the implication of his chapter on India is that its leaders can learn a limited truth, i.e., the need for some form of compulsion if India is to industrialize.

⁸¹ Moore loves to cite such great "truths" as: "A policy of law and order favors those who already have privileges, including some whose privileges are not very large." (*Origins*, 354). To which I might reply: "A policy of violence and disorder favors those who are both aggressive and strong, including those who are just a little more aggressive than the vast majority of the people."

far more difficult to dismiss their suffering than if they are merely "exploiters" and "oppressors." The image overwhelmingly conveyed by the volume is that of a Manichean struggle between Good and Evil.

And yet Moore's neo-Marxism also has disadvantages. Aside from the difficulties of applying the analysis to his material, difficulties which I have tried to outline in this paper, the approach limits his ability to draw moral lessons from history. What moral guide to action can we draw from the Japanese experience? As Moore describes it, the actors moved inevitably to a predetermined end.

Moore uses his categories as a rhetorical de-

vice, discarding them when they do not serve rhetorical purposes. Thus to demonstrate the impossibility of liberal or moderate reforms, he sometimes treats liberal or reformist ideas and the men who held them as free agents, who apply their ideology because they mistakenly believe in it rather than because of exploitive class interests.

It may be that violent national Communist revolutions are necessary if a good many of the developing nations are to modernize, and that the costs of such revolutions would be less than the costs of not having them. However, Moore has not made a case for this proposition. I find his position intellectually and morally untenable.

REPLY TO ROTHMAN

BARRINGTON MOORE, JR.

Harvard University

Stanley Rothman is laboring under a series of misapprehensions. What appears to give them some minimal coherence is evidently the curious conviction that in criticizing *Social Origins of Dictatorship and Democracy* he must cope with the work of a disillusioned former fellow-traveler. In discussing my alleged fundamental assumptions, toward the end of his essay, Rothman asserts:

Moore's writing indicates that he is one of that generation of scholars to whom the Soviet Revolution once represented the hope of a radical transformation of mankind. Disillusioned by the results of that Revolution, he has now, with the mellowing of the Soviet regime, been able to justify his earlier enthusiasm for it by arguing that it has been no more repressive than other alternatives. (31,506.)¹

Upon reflection I think I am entitled to take this as a compliment to my efforts at critical detachment. In my books on the Soviet Union I must have restrained my hostility to the point where my critic could succeed in discovering what he takes to be evidence of enthusiasm. At any rate, his discovery is a completely original one!

After this discovery Rothman goes on to at-

¹ With a sense of amused astonishment I reread pages 31 and 506 in *Social Origins*, which Rothman cited as specific evidence for his claims. On page 31 in footnote 65 I was *describing* a type of disillusionment that took place in England as the French Revolution entered its radical phase and comparing that disillusionment with American reactions to communist expansion after 1945. In so doing I said: "There is the same ambiguity about the character of the revolutionary enemy, the same exploitation of this ambiguity by the dominant elements in society, *the same disillusionment and dismay among its original supporters as the revolution abroad deceived their hopes.*" (Italics added) How Rothman could so misread my remarks as to attribute this type of disillusionment to me personally I cannot understand. On page 506 there is no hint at all of my alleged shift of views. Perhaps what Rothman meant to cite was page 505 where I said: "As I have reluctantly come to read this evidence, the costs of moderation have been at least as atrocious as those of revolution, perhaps a great deal more."

tribute ideas to me that he probably got from reading the works of my very good friend, Herbert Marcuse. For example, so far as I remember, I have never used the expression "non-repressive society," which has become in a way Professor's Marcuse's trade-mark. ("Less repressive" is quite another expression, which I do use.) Nor did I use the expression "free non-repressive society," preferring to say "free and rational society," on the page cited by Rothman in this same paragraph. Indeed, to continue examining this passage as an example of Rothman's criticism, I have never been sanguine about "revolutions in the third world as embodying hope for the future" of mankind, much as such revolutions against American attempts to prop up various forms of political landlordism do seem to me justified. But perhaps Rothman is simply mixed up, because I doubt very much that either Marcuse or I would ever speak about "the goal of a compulsionless society!"

By this point it may already be apparent that the basis of Rothman's critique is so comic I wonder whether he deserves a serious reply. I have decided to say something, however, because there may be a number of readers of this journal seriously interested in the issues who have not read *Social Origins*. It is also quite possible that he and his helpers have found some factual errors.²

² That I misuse my sources Rothman asserts more than once. Sometimes he means that my interpretation of an author's data leads me to a conclusion different from that of the author, as in the case of my use of the evidence in Mary Wright's *Last Stand of Chinese Conservatism*. That is a valid difference, I believe, and one that Rothman also uses when, for example, he draws different conclusions from those of E. P. Thompson (footnote 32), but its validity rests, of course, on the evidence offered for the change.

What appears to be a more damaging accusation is the kind of flat statement Rothman makes about my alleged inability to cite properly. For example, in referring to my discussion of the Community Development Program in India, he says: "Moore does not accurately cite a single case study in which reform is blocked by the power structure of the village." (p. 00) In the accompanying footnote, he cites only three of my many sources, declaring: "None of them directly support

This, however, is a matter I must now leave to specialists, since my work for the past five years has been on other problems. On the other hand, Rothman's treatment of my text raises serious doubts about his scholarly craftsmanship.

As a result of Rothman's technique of twisting arguments in *Social Origins* and then attacking these caricatures, the author finds it impossible to recognize his own views. *Social Origins* is mainly about different forms of social structure, their varying origins and political consequences. In its essentials, this central aspect escapes Rothman's vision. Thus he can assert that "Moore denies that the Chinese gentry differed in kind from other aristocracies," and can put the rhetorical question: "If, as he argues, Chinese and Japanese landlords were equally exploitive (*sic*) in intention, and neither contributed in any way to such [economic] growth, wherein lies the difference between the two societies?" After the pains to which I went to describe the differences—in respect to internal organization, relationships to the peasantry, to the government, and to the commercial classes—Rothman's comments show that he chose

his assertion and Beals [*Gopalpur*] states almost the opposite on p. 82."

In the first place, it is simply not true that the three sources (and others cited earlier and later) do not "directly support" my statements, which consist mainly of close paraphrases from the sources cited. Now, as to Beals' stating "almost the opposite" of my general view that the wealthy landlords blocked reform when it threatened their interests or control over the village, I see not the slightest contradiction on p. 82 of Beals' study. There Beals credits the wealthy Gopalpur landlords, who are the "kingpin of the social structure of the villages they control," with being "the innovators who introduce new agricultural techniques," as well as other improvements in the village in many cases. But unlike Beals, Rothman does not ask the simple question: "For whose benefit are these innovations or reforms?" Beals had already given his explicit answer on p. 80, where he pointed out that some wealthy landowners introduced new and costly fertilizer, equipment, crops and techniques—but they did this only on their own large acreage farms. Many of these innovations were not suitable for farms of small acreage, as is true elsewhere in the world, of course. Small farmers, then, remained dependent for seed and credit on the wealthy landlord. Furthermore, as Beals adds, on p. 82 but not cited by Rothman, "If those who now serve as laborers are converted into farmers, there will be no one to do the weeding and harvesting." The landlord's stake in the *status quo* is, I think, clear.

to sweep these crucial considerations under the nearest rug.

Somewhat earlier in his essay there is an even more glaring example. About my discussion of the American Civil War, Rothman says: "The assumption that Northern businessmen would have deferred to the leadership of Southern 'Junkers' to produce a 'German' solution to industrialization if the Civil War had not occurred is absurd." (p. 72) Here, as in many other instances, Rothman attributes to me views that are the precise opposite of those I expressed. My point was *not* that the Civil War prevented this form of coalition. Rather it was that the Civil War happened in large measure because the conditions necessary for this type of reactionary coalition were weak or absent.

Also typical is Rothman's habit of selecting part of an argument that seems to support his charges and omitting material that shows his claims to be false or ridiculous. For example, in my general discussion on moderate reform and revolutionary radicalism (pp. 505–506), Rothman chooses to quote *only* the three paragraphs that deal with the costs of revolutionary violence. The fourth paragraph, without which the whole discussion loses its focus, begins:

The gradualist argument seems shattered. But precisely at this point the revolutionary argument also collapses. It is clear beyond all shadow of doubt that the claims of existing socialist states to represent a higher form of freedom than Western democratic capitalism rest on promise not performance. There is no denying the patent fact that the Bolshevik Revolution did not bring liberation to the people of Russia. At most it may have brought the possibility of liberation. Stalinist Russia was one of the bloodiest tyrannies the world has yet seen.

In the same vein I went on to say that "The range and depth of Stalinist repression and terror were far too great to find explanation, let alone justification, through some conception of revolutionary necessity." For this terror, I pointed out, there were deep institutional roots, an issue discussed in other writings of mine. "In general," this passage concludes, "one of the most revolting features of revolutionary dictatorships has been their use of terror against little people who were as much victims of the old order as were the revolutionaries themselves, often more so."

On the whole, for all its scholarly façade, Rothman's critique has much of the air of a Congressional inquiry. Throughout, but especially toward the end, it has the characteristic ring of orthodoxy under threat and engaged in unmasking presumably dangerous intellectual in-

tentions. If there is a danger somewhere—and there probably is to important values that Rothman may possibly share with me—that danger resides primarily in a set of social facts and trends. *Social Origins* did not create the facts, and Rothman's earnest efforts will not make the facts go away.

As part of such attempts, he calls my views "neo-Marxist" or "vulgar Marxism." Now, my general view of Marxism is that it is often superb for the insights it gives into the behavior of the upper classes, but that it is nearly worthless for the understanding of the behavior of the lower classes. To be just a trifle more specific, the ways in which dominant classes pump an economic surplus out of the lower classes does, in my judgment, constitute a major key to the understanding of any specific social structure. Political levers, traditional customs and even values, all play their part—often one more crucial than the mode of production itself, in this process of extracting the surplus.³ On the other hand, the Marxist tradition is of little help, I find, in understanding those aspects of social structure among the lower classes that lead at times to resistance and revolution against the prevailing order or at other times to docile acceptance. If that is "neo-Marxism" ac-

³ As to my being anti-Weber, I can only say that I regret that Rothman can read *Social Origins* as constituting in any substantial sense an attack on Max Weber, whom I greatly respect and whose pessimistic views on Western civilization I share.

cording to *Social Origins*, so be it. I find only sheer caricature in Rothman's effort to restate my assumptions in the opening portion of his critique, with its remarks about the mode of production determining ideology, or on exploitation as a "primary goal" of ruling classes, or on the survival of Hinduism and the caste system "only because they served the interests of the ruling strata," or on the Meiji Restoration as "based entirely on the self-interest of a particular segment of the ruling class," or on past revolutions as "inevitable" (something patently unprovable). His restatement is a caricature of the *conclusions* I reached after much puzzling and re-thinking—and does not even dimly reflect the assumptions with which I began. In any case, the issue is not whether *Social Origins* is neo-Marxist or not—but whether it is correct.

It would be possible, though fruitless, to go on at much greater length and in greater detail—especially fruitless since "explicit disclaimers" do not constitute legitimate evidence to my critic. The book itself really has to stand as the most valid answer to Rothman's kind of criticism. It is safe to anticipate that my critic can and will find even more ideas in *Social Origins* and in my reply that he can misrepresent. Yet the ambiguity of his last paragraph gives me reason to think that the book carried some persuasion, even for him. Therefore I hope that even he may wish to reread it in a calmer spirit some years hence.

(EDITOR'S NOTE: For further comments by Professor Rothman, see the Communications section of this issue.)

A POSSIBLE EXPLANATION OF ROUSSEAU'S GENERAL WILL¹

PATRICK RILEY

Harvard University

A "general will" is a philosophical and psychological contradiction in terms; will is a conception understandable, if at all, only in terms of individual actions. The problem cannot be

N. B.: For the convenience of American readers, reference has been made whenever possible to a standard English translation of Rousseau. All translations from French editions are my own.

¹ This title was adopted not out of modesty, but simply because this article makes certain assumptions which are not universally agreed on. Most importantly, it holds that Rousseau understood "will" not only as a psychological attribute but also as a moral faculty; that there is an implicit metaphysical dimension in Rousseau without which a concept such as "willing" would be incomplete. By treating the concept of volition in psychological rather than in metaphysical terms, however, Mrs. J. N. Shklar, in her persuasive *Men and Citizens: A Study of Rousseau's Social Theory* (Cambridge University Press, 1969) is able to make the general will both internally consistent and closely related to Rousseau's individual psychology. That is, by treating individual will as a defense-mechanism, and the general will as a collective defense-mechanism (used largely as a weapon against inequality, whose effects for Shklar are mainly psychologically destructive), she is able to make the general will conceptually plausible. This reading, however, seems to involve a weakening of those (admittedly few) passages in which Rousseau speaks, in a traditional way, of volition as a moral faculty whose endorsement is the source of all moral legitimacy, e.g., "to deprive your will of all freedom is to deprive your actions of all morality" (*Contrat Social*, chapter IV). This idea is clearly the foundation of Rousseau's attack on paternalism and on the equation of right and force. It is certainly possible to conceive the "general will one has as a citizen" in a psychological and metaphorical sense, if one imagines this "generality" in terms of factors wholly congruent with psychology: education, public spectacles and games, the authority of the legislator. But this can never show how a will in anything but a psychological sense can be general, simply because the education and authority congruent with psychology are not congruent with a concept of free will and of moral choice. A psychological treatment of volition does in fact hold out the best prospect of a consistent treatment of Rousseau; but it also involves a weakening of the voluntarist and contractarian elements of his philosophy.

glossed over by attempting to reduce the general will—as did T. H. Green—to a "common ego," or to an analogical forerunner of Kant's pure practical reason.² Why, then, did Rousseau make so unviable an idea the center of his political theory,³ and why has that idea continued to receive serious attention?

The general will has continued to be taken seriously because it is an attempted (though not explicit) amalgam of two extremely important traditions of political thought, which may be called, roughly, ancient "cohesiveness" and modern "voluntarism." Political thought since the 17th century has been characterized, among other things, by voluntarism, by an emphasis on the assent of individuals as the standard of political legitimacy.⁴ One certainly finds this in many of the most important thinkers between Hobbes and Kant; and even Hegel, while scarcely an "atomistic individualist" or a contractarian, explicitly argued that while "in the states of antiquity the subjective end simply coincided with the state's will," in modern times "we make claims for private judgment, private willing, and private conscience." When a political decision is to be made, Hegel continued, "an 'I will' must be pronounced by man himself." This "I will," he thought, must have an "appropriate objective existence" in the person of a monarch; "in a well-organized monarchy, the objective aspect belongs to law alone, and the monarch's part is merely to set to the law the subjective 'I will'."⁵ If even Hegel allows this voluntarist turn in his own non-contractarian theory, it goes without saying that all of social contract theory can be seen as the supreme example

of voluntaristic ideas. No theory, then, escaped the enthronement of will—quite literally, in Hegel's case—at some point in the political scheme. Why voluntarism, political legitimacy through authorization by individual wills, came to hold such an important place in Western thought, requires a book to itself, a history of political will.⁶ What is probable is that ancient quasi-aesthetic theories of the best regime and the proper end of man gave way, with the introduction of Christianity, to thinking about politics after the model of “good acts”: just as good acts required both knowledge of the good and the will to do good, politics now required moral assent, the implication of the individual in politics through his own volition. The freedom to conform voluntarily to absolute standards had always been important in Christian doctrine; the Reformation doubtless strengthened the element of individual choice in moral thinking, while downplaying the role of moral authority. And it was natural enough that the Protestant view of individual moral autonomy and responsibility should spill over from metaphysics into politics, forming the intellectual basis of contract theory. The mere excellence of a social institution would no longer be enough; it would now require rational assent. However voluntarism and contract theory arose, what is certain is that ideas of the “good” state increasingly gave way to ideas of the merely “legitimate” state.⁷ And this legitimacy, after the 17th century, was often taken to rest on will.

But while voluntarism took care of legitimacy, it could say nothing about the intrinsic goodness of what is willed. It is, of course, possible to assert that whatever is willed is right simply because it is willed.⁸ But this was not enough for Rousseau; and it was precisely here that he made a stand for a particular kind of will. He wanted will to take a particular form;

he wanted voluntarism to legitimize what he conceived to be the unity and cohesiveness—the generality—of ancient polity, particularly of Sparta and Rome. Indeed his political ideal was the ancient polity, now willed by moderns who were as concerned with reasons for obligation as with perfect forms of government. Against the alleged atomism of earlier contract theory, Rousseau wanted the generality—the non-individualism, or rather the pre-individualism—of antiquity to be legitimized by consent. Here of course he got himself into the paradox of insisting on the willing of the essentially non-voluntaristic politics characteristic of antiquity. He got himself, that is, into a philosophical paradox of willed non-voluntarism; but if this paradoxical concept, the general will, a will which is the corporate “will” of a whole society, a will to stop being willful, cannot be philosophically defended, it can at least be unravelled with interesting implications for all voluntaristic and perfectionist theories—not to mention democratic theories, which are always hard-pressed to fuse what is wanted with what is intrinsically good. And this treatment helps to clear up some of the usually insoluble paradoxes in Rousseau, and to make his thought clearer, if not less problematical.

I

Jean-Jacques Rousseau was a severe critic of modern political life—of its lack of a common morality and virtue, of its lack of patriotism and civic religion, of its indulgence in “base” philosophy and morally unconstructive arts.⁹ At the same time, he was a great admirer of the more highly unified political systems of antiquity, in which, as he thought, morality, civic religion, patriotism, and a simple way of life had made men “one,” wholly socialized and truly political.¹⁰ And he thought that modern political

life divided man against himself, leaving him, with all his merely private and anti-social interests, half in and half out of political society, enjoying neither the amoral independence of nature nor the moral elevation afforded by true socialization.¹¹

Why Rousseau thought the unified ancient political systems preferable to modern ones is not too hard to understand. He conceived the difference between natural man and political man in very sharp terms; while for most contract theory political life was merely non-natural (and this largely to do away with arguments for natural political authority), for Rousseau it was positively unnatural, or anti-natural, a complete transformation of the natural man. The political man must be deprived of his natural powers and given others, "which are foreign to him and which he cannot use without the help of others"; politics reaches a peak of perfection when natural powers are completely dead and extinguished, and man is given a "partial and corporate existence."¹² The defect of modern politics, in Rousseau's view, was that it was insufficiently political; it compromised between the utter artificiality and communality of political life and the naturalness and independence of pre-political life, and in so doing caused the greatest misfortunes of modern man: self-division, conflict between private will and the common good, a sense of being neither in one condition nor another. "What makes human misery," Rousseau said in *Le Bonheur Public*, "is the contradiction which exists between our situation and our desires, between our duties and our inclinations, between nature and social institutions, between man and citizen."¹³ To make man one, to make him as happy as he can be, "give him entirely to the state, or leave him entirely to himself . . . but if you divide his heart, you will rip him apart; and do not imagine that the state can be happy, when all its members suffer."¹⁴

Above all, the imperfect socialization of modern man, in Rousseau's view, allowed private persons and corporate interests to control other private persons, leading to extreme inequality and personal dependence; only generality of laws based on an idea of common good, he thought, could abolish all private dependence, which was for him, perhaps, the supreme social evil. What he wanted was that socialized men might be "perfectly independent of all the rest, and extremely dependent on the city,"¹⁵ for only the power of the state, and the generality of its laws, "constitutes the liberty of its members."¹⁶

Ancient polities such as Sparta, Rousseau thought, with their simplicity, morality (or politics) of the common good, civic religion, moral use of fine and military arts, and lack of extreme individualism and private interest, had been political societies in the proper sense: in them man was "part of a larger whole" from which he "in a sense receives his life and being."¹⁷ Modern "prejudices," "base philosophy," and "passions of petty self-interest," on the other hand, assure that "we moderns can no longer find in ourselves anything of that spiritual vigor which was inspired in the ancients by everything they did" (*Gouvernement de Pologne*).¹⁸ And this spiritual vigor may be taken to mean the avoidance (through identity with a "greater whole") of "that dangerous disposition which gives rise to all our vices,"¹⁹ self-love. Political education in an extremely unified state will "lead us out of ourselves" before the human ego "has acquired that contemptible activity which absorbs all virtue and constitutes the life and being of little minds" (*Économie Politique*).²⁰ It follows that the best social institutions "are those best able to denature man, to take away his absolute existence and to give him a relative one, and to carry the *moi* into the common unity" (*Émile*).²¹ These social institutions, in ideal ancient polities, were always for Rousseau the creation of a great legislator, a Numa or a Moses: they did not develop and perfect themselves in political

experience, but were "handed down" by the law-giver.²²

But if Rousseau thought highly unified ancient polity, and its political morality of common good, superior to modern fragmented politics, and its political morality of self-interest, at the same time he shared with modern individualist thought the conviction that all political life was conventional and could be made obligatory only through individual consent. He very definitely thought that he had based political obligation and rightful political authority on convention: "civil association is the most voluntary act in the world; since every individual is born free and his own master, no one is able, on any pretext whatsoever, to subject him without his consent."²³ Indeed, the first four chapters of the *Contrat Social* are devoted to refutations of erroneous theories of obligation and right (paternal authority, the "right of the strongest," and obligation derived from slavery). "Since no man," Rousseau concluded, "has natural authority over his fellow men, and since might in no sense makes right, convention remains as the basis of all legitimate authority among men."²⁴

And yet Rousseau was also clear that contract theory provides, in itself, little more than a mere theory of political obligation. In the *Lettres de la Montagne* (VI), speaking of contract and consent, he said that a state is made one by the union of its members; that this union is the consequence of obligation; and that obligation can follow only from convention. He admitted that the foundation of obligation had divided political theorists: "according to some, it is force; according to others, paternal authority; according to others, the will of God."²⁵ All theorists, he said, establish their own principle of obligation and attack that of others. "I myself have not done otherwise," Rousseau declared, "and, following the soundest element of those who have discussed these matters, I have settled on, as the foundation of the body politic, the contract of its members." And he concluded by asking, "what more certain foundation can obligation among men have, than the free agreement of him who obliges himself?"²⁶

One may suspect that for Rousseau, contract theory was more a way of destroying wrong theories of obligation and authority, than of creating a comprehensive theory of what is

politically right. While for Hobbes and Locke the theory of obligation by consent is of central importance, for Rousseau it is not a complete political theory. Any political system "which confines itself to mere obedience will find difficulty in getting itself obeyed. If it is good to know how to deal with men as they are, it is much better to make them what there is need that they should be" (*Économie Politique*).²⁷ That, in a word, was Rousseau's criticism of all contract theory: it dealt too much with the form of obligation, with will as it is, and not enough with what one ought to be obligated to, and with will as it might be.

His criticism of Hobbes is based on this point. Hobbes had, indeed, established rightful political authority on consent, rejecting paternal authority and obligation based on either natural or divine law; he had made law (and therefore morality) the command of an artificial "representative person" to whom subjects were "formerly obliged" through transfer of natural rights (save self-defense) by consent.²⁸ But Hobbes had done nothing to cure the essential wrongness (in Rousseau's view) of modern politics; private interest was rampant, and indeed paramount, in Hobbes' system (could one not decide whether or not to risk one's life for the Hobbesian state?). The essential error of Hobbes, Rousseau thought, was to have read back into the state of nature all the human vices which half-socialization had created, and thus to see culturally-produced depravities as "natural" and Hobbesian absolutism, rather than the creation of a feeling of a common good, as the remedy for these depravities. "The error of Hobbes and of the philosophers," Rousseau declared, "is to confound natural man with the men they have before their eyes, and to carry into one system a being who can subsist only in another" (*L'État de Guerre*).²⁹ Rousseau, who thought that a perfectly socialized state (like Sparta) could elevate men, and turn them from "stupid and limited animals" into moral and intelligent beings,³⁰ must have thought Hobbesian politics incomplete, one "which confines itself to mere obedience," one which did not attempt to make men "what there is need that they should be," but which, through a system of mere mu-

tual forbearance,³¹ did not undertake any improvement in political life. "Let it be asked," said Rousseau, "why morality is corrupted in proportion as minds are enlightened";³² Hobbes might well have an enlightened view of obligation (to the extent that he based it on consent), but he did nothing about the moral corruption caused by "private interest" and "individual will."

Rousseau, then, held in his mind, at once, both the idea that the closely unified political systems of antiquity (as he idealized them) were the most perfect kinds of polity, and the notion that all political society is the conventional creation of individual wills through a social contract. Holding both these ideas created problems, for while the need for consent to fundamental principles of political society, for creation of a mere political construct through "will and artifice," are doctrines characteristic of what Michael Oakshott has called the "idiom of individuality,"³³ the ancient conception of a highly unified and collective politics was dependent not only on a morality of the common good quite foreign to any insistence on individual will as the creator of society and as the basis of obligation (and Rousseau sometimes recognized this, particularly in the *Économie Politique*), but was also dependent on a view of political life as the highest, most all-embracing end of man, and was, moreover, considered both natural, and prior, ontologically if not chronologically, to the independent existence of self-sufficient men. Given the ancient view of the morality of the common good and the supreme importance and naturalness of political life, ancient thought had not had to create theories of political obligation (which are needed only when the duty to obey is in doubt); politics being the highest end of man, obligation was not a real problem, and the task of the great legislator was not to show why men ought to obey, but merely in what way—under which kind of regime—they should do so. Legislation was the task of giving the most perfect form to an intrinsically valuable activity.

Rousseau, not being a systematic philosopher (as he often pointed out), never really reconciled the tensions between his theory of obligation, and his model of political perfection. If one wants to make Rousseau more consistent than he cared to be, one must admit that his ancient ideal model, as the creation, not of a contractual relation of individual wills, but of a great legislator working with political education and a

common good morality, is not "obligatory" on citizens, is not founded in right. It is true that Rousseau sometimes spoke as though ancient systems were constructed by mutual individual consent; but he did not usually speak in those terms. Even though, for him, all political society, ancient or modern, is artificial in the sense that it is not the original condition of man, contract theory comprehends an additional element of artifice, namely the notion that a society must be created by the will of all its members. Rousseau rarely spoke as though ancient polity had been artificial in this sense; he usually said that ancient systems were created, not by contract, but by the genius of legislators like Moses and Lycurgus. Moses, for example, "had the audacity to create a body politic" out of "a swarm of wretched fugitives"; he "gave them customs and usages."³⁴ Lycurgus "undertook to give institutions" to Sparta; he "imposed on them an iron yoke" (*Gouvernement de Pologne*).³⁵ It is, really, only in the *Contrat Social* that Rousseau makes much reference to consent or contract in ancient politics; the usual emphasis (as in the *Économie Politique* and *Gouvernement de Pologne*) is on great men, political education, and the absence of a highly developed individual will.³⁶

One can say, moreover, if one wants to juxtapose parts of Rousseau's thought to each other, that he made fundamental errors in analyzing the unified spirit of ancient politics, by recognizing the desirable effects of a morality of the common good, without recognizing that the very absence of a notion of individual will as supreme had made that morality (and thereby that unity) possible. But, after all these things have been pointed out, it remains to be said that Rousseau was consistently clear that modern calamities caused by self-interest must be avoided, and that the political systems created by ancient legislators were better than any modern ones. Although it did not always occur to Rousseau that both the merely self-interested will which he hated, and the will necessary for consent to conventional society, were part of the same idiom of modern political thought, and perhaps inseparable, he always thought that mere will, as such, could never create a proper political society. For him, then (whatever the confusions over naturalness, will, or the presence or absence of either or both in any political idiom), the problem of political theory, above all in the *Contrat Social*, became that of reconciling the requirements of consent (which obligates) and

perfect socialization (which makes men "one"); men must somehow choose the politically perfect, somehow will that complete socialization which will preclude self-division. Will, though the basis of consent, cannot be left as it is in traditional contract theory, with no proper object. If it is true that it is the source of obligation, it is also true that merely self-interested will is the cause of everything Rousseau hated in modern civilization.³⁷ And perfect political forms, whatever Rousseau might have said about their being "given," must now (in the *Contrat Social*) be willed.

Setting all the contradictions and vacillations aside, then, there are two important elements in the two views that Rousseau held simultaneously: first, that the importance of ancient polity had to do with its unity and its common morality, and not with its relation, or lack of it, to contract theory; second, that individual consent (whatever this might do to the "legitimacy" of Sparta) is needed for obligation, which is needed because the state is conventional. It is impossible to make every element of Rousseau both consistent and true to the political principle that he tried to establish: that will is not enough, that perfect polity alone is not enough, that will must be united to perfection, and that perfection must be the standard of what is willed. And this, perhaps, is the source of that odd idea, *general will*: a fusion of the generality (unity, communality) of antiquity with the will (consent, contract) of modernity. What makes Rousseau, without doubt, the most utopian of all great political theorists, is his insistence that even a perfect political system be willed by all subject to it. "Undoubtedly," he said, "there is a universal justice derived from reason alone; but this justice, to be admitted among us, must be mutual . . . conventions and laws are necessary, therefore, to unite rights with duties, and to accomplish the purposes of justice."³⁸ Though "that which is good and conformable to order is such by the nature of things, independent of human conventions,"³⁹ those conventions are yet required.

Rousseau's political thought is a noble attempt to unite the best elements of contract theory, of individual consent, with his perfect, unified ancient models, which, being founded on a morality of common good, had no private wills to "reconcile" to the common interest (which was natural), and thus no need of consent, no need of contract. It is this (perhaps unconscious and certainly unsystematic) attempt to fuse two

modes of political thought, to have common good *and* individual will, which gives Rousseau's political thought that strange cast which some have thought contradictory; a vacillation between "individualism" and "collectivism," but which was not merely that. The problem for Rousseau was more specific and more subtle: how one can obey only his own free will, the source of obligation, in society; how it is possible to purify this will of mere private interest and selfishness, which create inequality, destroy virtue, and divide man against himself; how it is possible to insure that this individual will will want only what the common good—preferably a common good like that of ancient politics—requires. It is really a problem of retaining will, but of making it more than mere will, so that society will have a common good and a general interest, *as if it enjoyed a morality of the common good*—a morality which Rousseau sometimes recognized as the real foundation of ancient unity.

Looked at from this point of view, all of the paradoxes and "problems" in Rousseau's theory become comprehensible: why will must be retained, and why it must be made "general"; how general laws will promote the common good, but why not law, but legislative will, is final; why a great legislator can suggest perfect political forms, and why he cannot merely impose them. Above all, it is clear that this point of view helps to explain the greatest paradox in all of Rousseau—that is, the paradox created by the fact that, in the original contractual situation, the motives needed by individuals to relinquish particular will and self-interest, and to embrace a "general" will and the common good, cannot exist at the time the compact is made, and can only be the *result* of the socialization and common morality that society alone can create.⁴⁰ It is certain that if either an ideal of social perfection (Sparta), or a notion of conventional society created by mere will, were enough for Rousseau, he never would have insisted on a combination of will and perfect socialization, on a general will. There would, in fact, be no paradox at all, if perfection were only a formal question, if the state were founded on a morality of the common good and obligation were not a central problem. A great legislator, like Moses or Lycurgus, could create the best forms, and obedience would be only a question of correspondence to a system naturally and rationally right. But Rousseau said that a new-born people must, in order to will good laws, be able to "appreciate sound political prin-

ciples";⁴¹ these cannot be merely given to them, but must be willed. Why is it that "the social consciousness to be created by the new institutions would have to preside over the establishment of those same institutions,"⁴² unless, somehow, the people must understand and will the system? There would be no paradox of cause and effect (the central problem of sound politics) in Rousseau if men did not have both to will, and to will a perfection which presupposes (on Rousseau's own terms) a transcendence of mere will, and the attainment of all the advantages of a morality of the common good, without actually having that morality, which would destroy obligation.

It remains to show that the attempted fusion of individual will and common-good morality is comprehended in the notion of the general will.

II

Rousseau begins the *Contrat Social*, not with the conception of general will, but with a fairly traditional contractarian view of the origin of society. Men being naturally (if not by nature)⁴³ perfectly independent and society made necessary only by the introduction of property (and the consequences of this introduction), men unite by contract to preserve themselves and their property. In this conventional society, there is an area of common interest, "for if the opposition of private interests made the establishment of societies necessary, it is the agreement of these same interests that made it possible."⁴⁴ It is "what these several interests have in common," says Rousseau, "that constitutes the social bond." It is only on the "basis of this common interest that society must be governed."⁴⁵

Rousseau does not talk in these rationalistic, contractarian terms for very long. Soon enough it turns out that society's "common interest" is not merely what a lot of private interests have in common: society, when it is perfect, is a complete transformation of these private interests; it is only when "each citizen is nothing, and can do nothing, without all the rest," that

society "may be said to have reached the highest attainable peak of perfection."⁴⁶ It is only, in other words (keeping in mind which societies had attained peaks of perfection), when society is much like highly unified ancient society, that "perfection" is reached; it is only "in so far as several men conjoined consider themselves as a single body"⁴⁷ that a general will can operate.

This transformed society must be governed on the basis of common interest (which has become something more than traditional common "interest"); only general laws, the creation of a general will (sovereignty), can govern the common interest.⁴⁸ Laws must be perfectly general, because the general will which makes them "loses its natural rectitude when directed toward any individual and determinate object."⁴⁹ The sovereign (the people when "active," when willing fundamental law) must, of course, make such law: "the people subject to the laws should be their author; only those who are forming an association have the right to determine the conditions of that society."⁵⁰ But, if fundamental law is the creation of a general will, how does such a will come about? It cannot be the sum of individual wills, for "the particular will tends by its nature to partiality,"⁵¹ and this, clearly, has been the source of modern "calamities." Law must be willed by those subject to it, for will is the source of obligation. Yet mere wills can never yield generality, and law must be perfectly general, which can happen only "when the whole people legislates for the whole people."⁵² If general laws alone, composed with a view to the common good, were enough, there would be no problem; but even the most general laws must be willed. How can a self-interested multitude "by itself execute so great and difficult a project as a system of legislation?"⁵³ How can a genuine general will, which will create general "conditions" for society, arise?

It is on this point that Rousseau is weak, uncharacteristically weak; he is always able to say what a general will must *exclude*, but he cannot say what it is. And this should come as no surprise. For, strictly speaking, the idea of general will is an impossibility; the ideas of generality, and of will, are mutually exclusive. Will, whatever its crudity as a psychological construct, is characteristically a concept of individuality, of

⁴¹ *Ibid.* (CS).

particularity, and it is only metaphorically that one can speak of will as "general." No act of philosophic imagination can conjure up anything but a personal will. What can be imagined (and what, in any case, Rousseau admired in ancient society), is not really a "general" will, but a political morality of common good, in which individual will is, to be sure, not suppressed, but simply does not appear in contradistinction to, or with claims or rights against, society. What gave ancient polity (particularly in theory) its unity was not the concurrence of many wills on central points of common interest; rather a moral idiom in which extreme socialization was natural, and in which there was little notion of "will and artifice," gave rise to this unity.

There are a number of revealing passages in which Rousseau observes that something like a political morality of common good, rather than a general will, is necessary for the unity and communality which he desires—for example, at the end of Book II of the *Contrat Social*, where he discusses "the most important of all" laws, "which preserves the people in the spirit of its original institutions," that is, "manners, morals, customs and, above all, public opinion . . . a factor with which the great legislator is secretly concerned when he seems to be thinking only of particular regulations."⁵⁴ Here Rousseau does not, of course, speak of consent or will, but of a kind of political education which will promote a common good.

And he gave other indications that he knew that unity was the consequence of thinking about political relations in terms of a common good, rather than in terms of "cancelling out" of private wills "all the mutually destructive pluses and minuses," so that a "general will remains as the sum of the differences."⁵⁵ Indeed, in the *Économie Politique* he said that if men "were early accustomed to regard their individuality only in its relation to the body of the state, and to be aware, so to speak, of their own existence merely as a part of that of the state, they might at length come to identify themselves in some degree with this greater whole. . . ."⁵⁶ If children are educated in state laws which promote only a common good and a common morality, "they will learn to cherish one another mutually as brothers, to will nothing contrary to the will of society."⁵⁷ There are similar passages in the *Gouvernement de Pologne*, and in the *Projet pour la Corse*, in which the idea of a morality of the common good, reinforced by political educa-

tion and legislation, is set forth, with little or no reference to consent or to will.⁵⁸

But, much of the time, and particularly in the *Contrat Social*, Rousseau speaks not in the idiom of the common good, but of a tension between particular will and general will, and of *reconciling* these wills.⁵⁹ Indeed, the whole concept of political virtue is entirely tied up with this reconciliation of wills, as Rousseau demonstrates in the *Économie Politique*. There he says that the "first and most important rule of legitimate or popular government" is "to follow in everything the general will," but that, in order to follow the general will it must be known, and clearly distinguished from individual or particular will, and that "this distinction is always very difficult to make, and only the most sublime virtue can afford sufficient illumination for it."⁶⁰ A few pages later, he says that "if you would have the general will accomplished, bring all particular wills into conformity with it; in other words, as virtue is nothing more than the conformity of the particular wills with the general will, establish the reign of virtue."⁶¹ Is it not clear that the argument is circular?—that conformity of particular to general will creates virtue, and that virtue is necessary to bring particular will into conformity with general will? This circularity is not due to the fact that Rousseau had no clear conception of virtue; on the contrary, ancient politics were models of virtue, as he described them.⁶² The circularity is caused by trying to make virtue *as* unity, *as* communality, dependent on reconciliation of particular to general will, whereas in fact (and as Rousseau recognizes on adjoining pages of the same treatise), virtue *as* conformity to a common good morality is the creation of great legislation and political education. Vacillation on the true source of ancient unity and communality (reconciliation of wills, or absence of will), is the cause of the circularity of the concept of virtue in Rousseau; moreover, this circularity reflects the same kind of cause-effect paradox as that referred to at the end of part I. In both cases, Rousseau knows perfectly well what he admires: the virtue of ancient society, and the perfection of laws in ancient society. It is only when, in both cases, he tries to describe the possibility of these attrib-

utes in terms of reconciled will that he falls down. Nor is this surprising; for, as has been noted, he did, sometimes, recognize that the absence of the very notion that caused all his problems—will as supreme—had constituted the greatness of antiquity. All the paradoxes, circularities and vacillations in Rousseau are caused by the attempted fusion of moral-political idioms which are incompatible on fundamental points.

A clear illustration of just this point is Rousseau's treatment of Brutus in the *Histoire des Moeurs*; in that fragment Rousseau, observing that "it will always be great and difficult to submit the dearest affections of nature to country and virtue,"⁶³ cites Brutus' execution of his treasonous sons as an example of this "submission," not ever mentioning that this was no case of "submitting" particular will to a general will, but (more likely) a case of a common-good morality (coupled with the rights of the Roman *pater familias*) at work. Yet in other works written at about the same time, he makes no reference to submission of will in Roman society, and talks only of legislation and political education.⁶⁴

Nonetheless (and despite these vacillations), it is easy to see why a fusion of political idioms was attempted. For even though perfect socialization was Rousseau's ultimate ideal, consent and will, as the source of obligation, were too important to be summarily discarded. Thus the general will, though an impossibility, was a necessity.

"Actually," said Rousseau, "each individual may, as a man, have a private will contrary to, or divergent from, the general will he has as a citizen" (*Contrat Social*).⁶⁵ This could not, of course, be the case in a state with a common-good morality reinforced by legislation and education (the system sketched in the *Économie Politique*). The passage cited from the *Contrat Social* shows that in that work, the most "contractarian" of Rousseau's writings, and the closest thing he had to a systematic political theory, neither mere will nor perfection wins out alone. For in the *Contrat Social*, there is the possibility that a private person (already a concept of modern individualism) may regard "the artificial person of the state as a fictitious being," and that this "may make him envisage his debt to the common cause as a gratuitous contribution."⁶⁶ It seems clear that if Rousseau were not

trying (however unsystematically) to reconcile will and perfect socialization, these problems could not exist: the new state could not be considered a fictitious being (for it would educate men to think something different); one would not think of his political role as a "contribution" (because one would be naturally part of a greater whole); and there would be no conflict between man and citizen (because the distinction would not exist). Is not the paradox that a man must be "forced to be free"⁶⁷ if his particular will does not conform to the general will an indication that Rousseau tried to gain the advantages of a common-good morality (particularly in the *Contrat Social*) through reconciliation of wills, and this only because will is necessary to obligation?

There is, finally, in Rousseau's most systematic political work (the *Contrat Social*), no postulation of a political morality of the common good as the source of the much-desired unity. Rather, there is a constant attempt to bring particular will into conformity with general will through the efforts of a "great legislator." What the great legislator, in his wisdom, knows to be good, supplies the absence of a common-good morality. Now, the difference between the great legislator of ancient politics and Rousseau's ideal legislator, corresponds exactly to the difference between giving a presupposed unity (without strong will) a perfect form (antiquity), and making people *will* perfect forms (modernity). "All" in the contractual period "stand equally in need of guidance."⁶⁸ Individuals "must be obliged to bring their wills into conformity with their reason," that is, they must will that which is, in itself, rationally best. The combination of individual consent and the legislator's guidance "will effect a union of understanding and will within the social body."⁶⁹ And what is rationally best (to avoid that self-division caused by half-socialization) is the perfectly united and communal polity of antiquity. The legislator, who effects the bringing of will into conformity with reason (not by force, but through persuasion and religious devices), supplies the defect of common-good morality, and simply gets each individual to will something like the laws which *would have* resulted from such a morality. What Rousseau ultimately has, then, is not a "general will" (which is inconceivable), but a "will to the general," which is conceivable if one recalls that political perfection requires both truly general laws and consent to them. Rousseau did not, could not, abolish will—but he prescribed the

⁶⁹ *Ibid.*

form that it must take, and this form is clearly derived from the generality and unity of ancient polity (as Rousseau saw it)—but without a morality of common good, which would have destroyed obligation.

Moreover, not only the form of laws (generality) is derived from ancient models; the *conditions* under which good laws (and indeed good states) are possible, are little more than idealizations of ancient political circumstances. A people is "fit for legislation," according to Rousseau, if it has no old laws, if it is free from threats of invasion and can resist its neighbors, if it is small enough that its "individual members can all know one another," if it can get along without other peoples, if it is "neither very rich nor very poor," and can be self-sufficient, and if it is one which "combines the firmness of an old people with the docility of a new one."⁷⁰ Clearly most of these conditions of the possibility for good polity are abstracted from Rousseau's idealized version of ancient city-states, particularly Sparta. Not only the form of a good political system, then, but also the empirical conditions which could make such a system possible, are derived from Rousseau's models of perfection.

What has been said thus far may be summarized in this way: 1) a perfect state (that is, a perfectly socialized, united and communal state) would have perfectly general laws (that is, laws dealing only with Rousseau's vision of a common good); 2) but laws, especially the most general laws, must be willed by everyone subject to those laws, in order to be obligatory—and they must be made obligatory, for society is merely conventional; 3) therefore, will must take the form of general laws; 4) but will tends to the particular, and law, though the creation of will, must somehow be general; 5) moreover, for particular wills to appreciate the necessity of general laws, effect would have to become cause; 6) therefore, a great legislator, whose instruction can supply the defect of a morality of the common good—the only morality which would *naturally* produce general laws—is necessary; 7) but this legislator is impossibly rare, and, in addition, he cannot create laws, however general and good, for sovereignty is inalienable; 8) thus the legislator must have recourse to religion, and use it to gain the consent of individuals to the general will; 9) but now "consent" is something less than real consent, since an irrational device has been used; 10) finally, the whole system is saved for individual will by the fact that "a people always has a right to change its laws, even the best,"⁷¹ that legislative

will, rather than law itself, is supreme, and that the entire social system can be abolished by will, for "there is not, and cannot be, any sort of fundamental law binding on the body of the people, not even the social contract."⁷²

The theory of Rousseau, then, ultimately reduces itself to two elements: the need for a great legislator to create a "general will," and the extreme limitations put on this legislator by the fact that this general will, though (of course) general, is still will, and must be will. Both elements are the consequence of attempting to unite all the requirements of will with all the advantages of perfect socialization. The legislator may formulate and propose general laws which will produce perfect socialization, and he can get them "willed" through religious devices; but the sovereign cannot be permanently bound, even by perfect laws, and can change these laws and even dissolve society. Thus neither perfection nor will has all the claims in Rousseau; but will can finally be, even if only in a destructive way, triumphant, for if a people "is pleased to do itself harm, who has a right to prevent it from doing so?"⁷³

It is not meant, by analyzing Rousseau in this way, that he was always perfectly consistent in desiring that particular wills should consent to that which an ancient morality of common good would require; indeed, he vacillated on several points, notably in his treatment of civil religion, in which he allowed any tolerant sect to exist, so long as it did not claim exclusive truth or refuse to subscribe to the basic articles of civic religious policy.⁷⁴ Above all, though, Rousseau insisted that each socialized man should somehow "obey no one but himself," and thought he had found a solution to this problem in making the conditions of society (laws) perfectly general and equally applicable to all, so that, the conditions being equal for all, and willed by all, "it is in the interest of no one to make [social requirements] burdensome to the rest,"⁷⁵ and that, since the society cannot wish to hurt all its members by enacting bad general laws, society need offer its members no guarantees.⁷⁶ But this system is essentially modified by the fact that a will to general laws absolutely cannot be attained with mere wills as they are (the cause-effect problem again), but only through the influence of a great legislator: by Rousseau's assertion that there is no real limit to the extent of undertakings possi-

ble between the sovereign and its members;⁷⁷ by the idea that the sovereign is the sole judge of how many "powers" of individuals must be socialized;⁷⁸ and by the notion that an ideal society should be very highly socialized indeed. It is modified above all by part IV, chapter II of the *Contrat Social*, which shows, perhaps more clearly than anything in Rousseau, that consent is no longer to be a question of mere volition, and that the general will is something like a modified common-good morality.

The constant will of all the members of the state is the general will; that is what makes them citizens and free. When a law is proposed in the assembly of the people, what the voters are being asked is not precisely whether they do or do not approve of the proposal, but whether or not it is in conformity with the general will, which is their own. Each, when casting his vote, gives his opinion on this question; and the declaration of the general will is found by counting the ballots. Thus when an opinion contrary to my own prevails, this proves nothing more than that I was mistaken, and that what I thought to be the general will was not.⁷⁹

The meaning of this (usually confusing) passage can be understood if "common good" be substituted for "general will"; then it can be seen how general will is *constant* will, and how citizens are not being asked whether they approve a proposal, but whether it is in conformity with a common good.

With all of these modifications in mind, it is clear that, while Rousseau's theory of society and law really is, as he insisted, an attempt to preserve liberty, that liberty is conceived in an odd way: it is "obedience to self-imposed law"⁸⁰ (which must, of course, be general law). Liberty, then, comes down to freeing the individual of all private dependence by making him "very dependent on the city" and its general and equally-applied laws. But, though liberty is obedience to self-imposed law, proper law cannot be created without modification of will by a great legislator, and thus the very idea of liberty is, like other elements of Rousseau, a fusion of the idioms of individual will and of highly unified society. It is because of these modifications that Rousseau's political theory cannot be so easily assimilated to traditional constitutionalism, or to Kant's theory of law, as

some have imagined.⁸¹ For legislative will, and not law itself, is supreme in Rousseau. Nor can Rousseau be easily assimilated to the German "romantic" tradition of the early 19th century, because he would never have replaced general will with the historical evolution of national spirits; he was clear that history, in itself, cannot "justify" anything.⁸² This non-assimilability to other traditions proves that those who view Rousseau as a unique and isolated figure are probably correct; he was, in his own words, one of those few "moderns who had an ancient soul."⁸³

III

The only object of this study has been to elucidate the concept of the general will, and to clear up some of the paradoxes in the *Contrat Social*, by analyzing what Rousseau thought about will and contract, on the one hand, and about perfect political systems, on the other. It has not been a central object to attack Rousseau as unsystematic, to reproach him for not adequately reconciling two modes of political thought, or to "improve" his ideas by making them more consistent. No series of conceptual ambiguities can detract anything from Rousseau's status as the greatest of political psychologists and the most eloquent critic of the psychological destruction wrought by inequality. Nonetheless, it is evident that there is an insurmountable conceptual problem in Rousseau's political thought, and it is this: voluntarist theories are usually composed of two parts, a theory of will as a moral agency, and a theoretical standard of right to which will ought to conform (arbitrary willfulness usually being rejected as a standard of right). In Locke or in Kant, the standard of right to which will must conform (natural law in the first case, universal rational law in the second) does not contradict voluntarism (once one gets around the problem of reconciling free will and absolute standards: in itself a problem which defeated a Leibniz and reduced Kant to hypotheses). But in Rousseau the standard to which will must conform (ancient perfection, or its equivalent) is itself non-voluntaristic; and therefore will and the standard to which it must conform are contradictory. The standard which gives will its object is the very

⁸¹ Cassirer, Ernst, *Rousseau, Kant and Goethe*, translated Gutmann, Kristeller and Randall, (Harper Torchbacks, New York, 1963), pp. 30 ff.

negation of voluntarism. And it is for this reason that Rousseau's political system is somewhat paradoxical. The idea of general will, the paradox of cause and effect in the contractual situation, the circularity of the concept of virtue—all these are due to an attempt to fuse the advantages of a politics founded on will, and of one founded on reason and perfection. One must, in Rousseau, will the kind of society in which one lives, because "to deprive your will of all freedom is to deprive your actions of all morality,"⁸⁴ and this deprivation destroys the obligation one has to obey. Yet mere will can yield only particularity and inequality, and will never produce rational perfection. To retain the moral attributes of will, but to do away with will's particularity and selfishness—that is the problem of Rousseau's political thought. It is a problem which reflects the difficulty which Rousseau found in making free-will and rational authority co-exist in his moral and political thinking. Freedom of the will is as important to the morality of actions for Rousseau as for any traditional voluntarist; but he was suspicious of the very faculty, the only faculty, which could moralize. And that is why he urged, in the *Économie Politique*, that "the most absolute authority is that which penetrates into a man's inmost being, and concerns itself no less with his will than with his actions."⁸⁵ Can the will be both morally autonomous and subject to the rationalizing influence of authority? That was the point which Rousseau never settled altogether. Even Émile, the best-educated of men, chooses to continue to accept the guidance of his

teacher.⁸⁶ How much more, then, do ordinary men need the guidance of a great legislator when they embark on the setting up of a system which will not only aid and defend, but also *moralize* them! The relation of volition to authority is one of the most difficult and one of the most inscrutable problems in Rousseau; the general will is dependent on "a union of will and understanding within the social body,"⁸⁷ but that understanding, which is provided by authority, weakens the idea of will as an autonomous authorizing faculty.

To project the question on a grander scale, one can see in Rousseau's political thought an intuitive attempt to reconcile the two greatest traditions of Western political philosophy, that of "will and artifice" and that of "reason and nature." (Oakeshott) For general will is surely rationalized will. And yet it is not self-rationalized will in a Kantian sense, but will rationalized by the standards and conditions of idealized ancient polity.

Whatever Rousseau's means, in undertaking a fusion of two great modes of political thinking, and however unsuccessful the attempt to make general will a viable conception, one must always, while analyzing and even criticizing the result, grant the grandeur and importance of the effort. For if one could succeed in having the best of both idioms, one would have a political philosophy which would synthesize almost everything valued in the history of Western political thought.

INTERNATIONAL SUBSYSTEMS: STABILITY AND POLARITY

MICHAEL HAAS

University of Hawaii

I. BIPOLAR OR MULTIPOLAR STABILITY?

One of the current controversies within international relations deals with the "stability" of bipolar as opposed to multipolar stratifications of world power. Morton Kaplan, in codifying the views of classical balance of power theorists,¹ advances the view that multipolar systems are more stable than bipolar systems.² Kenneth Waltz, sagely pointing to the relatively peaceful international arena since World War II, argues that a bipolar distribution of power can guarantee world stability.³ Many a priori arguments have been presented to buttress the Kaplan and Waltz hypotheses.⁴ In one of the most

¹For statements of classical "balance of power" theory, see R. W. Mowat, *The European States System* (London: Oxford University Press, 1929); Carl J. Friedrich, *Foreign Policy in the Making* (New York: Norton, 1938); Hans J. Morgenthau, *Politics Among Nations* (4th ed.; New York: Knopf, 1967), Part IV; Frederick L. Schuman, *International Politics* (6th ed.; New York: McGraw-Hill, 1958), pp. 70-72, 275-78, 577-79, 591-92; Martin Wight, *Power Politics* (London: Royal Institute of International Affairs, 1946). ⁴Among the advocates of multipolarity we may count Roger D. Masters, "A Multi-Bloc Model of the International System," this REVIEW, LV (December, 1961), 780-98. Bipolarity is favored by Raymond Aron, "The Quest for a Philosophy of Foreign Affairs," *Contemporary Theory in Inter-*

elaborate such formulations, the "interaction opportunity" hypothesis of Karl Deutsch and J. David Singer, the presence of stabilizing cross-cutting alliances is postulated to be most likely within multipolar systems, which in turn are a function of the number of major powers and members of a system.⁵ In an attempt to bring the two opposing strands of theory into a larger framework, Richard Rosecrance more recently has suggested that bipolarity and multipolarity may each have their peculiar costs and benefits.⁶ Bipolarity, according to Rosecrance, is distinguished by (1) an absence of "peripheries," such as areas for colonial expansion or neutral powers to woo; (2) all international behavior is highly politicized; (3) there are many crises; (4) changes in power confrontations are either significant or trivial, with no intervening shades of gray; (5) each pole is dominated by major powers highly motivated to expand their domains, willing even to incur brinksmanship situations and hostility spirals; (6) no detente is possible. Multipolarity, on the other hand, is hypothesized to have (1) more interaction opportunities and thus less preoccupation (or obsession) with any one set of states; (2) fewer arms races; (3) more international conflicts; (4) the outcomes of international conflicts are harder to predict in advance; (5) changes in power confrontations have ambiguous consequences for the overall distribution of power. Rosecrance, therefore, urges a "bi-multipolar" arrangement that would combine the best features of both alternatives. The empirical questions and intriguing hypotheses so eloquently raised by Kaplan, Waltz, Deutsch, Singer, and Rosecrance have remained largely unexamined, however.

To date only two efforts have been made to

national Relations, ed. Stanley Hoffmann (Englewood Cliffs: Prentice-Hall, 1960), pp. 79-91; Amitai Etzioni, *Political Unification* (New York: Holt, Rinehart, Winston, 1965), pp. 69-70. See, however, William E. Griffith, "Eppur Se Muove," *Daedalus*, XCIII (Summer, 1964), 916-19.

⁶Richard N. Rosecrance, "Bipolarity, Multipolarity, and the Future," *Journal of Conflict Resolution*, X (September, 1966), 314-27.

assemble data for a test of the proposition that international stability is related to the stratification of power in international systems. In one study, Rosecrance establishes nine historical "international systems" between 1740 and 1960 in terms of differing power configurations.⁷ After delineating a number of qualitative categories for describing an international system, he supplies codings for each of the nine systems and proceeds to conduct a necessary and sufficient condition analysis of preconditions to *stability*, which he defines as the ability of a regulator to cope with disturbances threatening to undermine an existing power distribution (where the ratio of regulator strength/level of disturbance is high). With respect to power distribution, the lone unipolar system in his sample is fairly stable, but multipolarity is as Kaplan predicts clearly more stable than bipolarity. Considering "resources" either as areas ripe for colonial and imperial expansion or as new states that may be targets for ideological or political proselytization, Rosecrance's codings reveal that the availability of unappropriated resources makes for stability; scarcity, for instability. The existence of contending or non-status quo ideologies means that conflict will be intense, but a divergence in ethos between elites is neither a necessary nor a sufficient condition for instability, thus confirming Waltz' suspicion concerning the insignificance of ideological aspects of the contemporary bipolar world. Insecurity of domestic elite tenure at home is always associated with instability abroad. But the drawing of boundaries such that allegiances are nationalist rather than dynastic has not resulted in a more benign international arena; in fact, unstable systems have been encountered more frequently since the rise of nationalism and the use of citizen forces. The increasing world level in economic development is associated with a higher level of disturbance and fails to be channelled to augment the power of regulators of international systems. And no single regulator, whether balance of power, concert of great powers, alliance

system, or international organization, has been able to maintain stability in all of the cases: the record of the concert is better, but the breakdowns of 1848 and 1914 were too extraordinary for an informal practice of summit conferences to avert or to resolve. Whenever the disturbance level is high, regulators have proved inadequate.

In a second study, J. David Singer and Melvin Small pay closer attention to alliance patterns. Starting with the hypothesis that the onset of war is associated with an increase in alliance commitments between countries, they assemble an impressive array of data on wars and alliances in order to test balance of power theory empirically.⁸ For the years between 1815 and 1945 they collect statistical indicators for each member of the family of nations, and slice international systems in a manner not dissimilar to Rosecrance, for they analyze four subsamples of international systems—a "central system" composed of mostly European countries for two eras, 1815–1899 and 1900–1945, and a "total system" of central and peripheral countries for the same two eras. Although intercorrelations between number of alliances and number of wars are mostly positive across all years for the total and central systems, when results for the nineteenth century are compared with twentieth century findings, the two eras exhibit opposite patterns. For the 1900–1945 period most correlations are positive, demonstrating that modern wars have been preceded by the formation of many alliances; between 1815 and 1899, in contrast, correlations are mainly negative, revealing that alliance involvement may have served as a deterrent to the expression of international conflict by military means in the nineteenth century.

The two studies, however, were not originally designed to permit a comprehensive, systematic test of the relationship between power distribution and international stability. If we define a *pole* as a militarily significant cluster of units within an international arena, and *stability*⁹ in terms of rates of incidence of warfare within the arena, we soon discover that the analytical procedures followed by Rosecrance, Singer and Small need to be clarified and tightened considerably,

⁷ Richard N. Rosecrance, *Action and Reaction in World Politics* (Boston: Little, Brown, 1963). For some critiques, see George Liska, "Continuity and Change in International Systems," *World Politics*, XVI (October, 1963), 118–36; James N. Rosenau, "The Functioning of International Systems," *Background*, VII (November, 1963), 111–18; Dina A. Zinnes, "The Requisites for International Stability," *Journal of Conflict Resolution*, VIII (September, 1964), 301–305; J. David Singer, "The Global System and Its Sub-Systems: A Developmental View," *Linkage Politics*, ed. James N. Rosenau (New York: Free Press, 1969), pp. 21–43.

⁸ J. David Singer and Melvin Small, "Alliance Aggregation and the Onset of War, 1815–1945," *Quantitative International Politics*, ed. Singer (New York: Free Press, 1968), pp. 247–86.

⁹ "Stability" is most customarily defined as behavioral change over time, such as in Michael Haas, "Types of Asymmetry Within Social and Political Systems," *General Systems*, XII (1967), 69–79. Rosecrance's definition deals with the extent of regulatory potency in coping with instability.

especially with respect to the criteria for selecting "international systems." One question to pose is *geographic*—whether Rosecrance's nine and Singer's and Small's four systems are international or in actuality are regional in scope. Rosecrance makes occasional references to events taking place in North America and Japan, but most of his attention is directed to European interstate politics; Singer and Small explicitly acknowledge that their "central" systems are European in composition. A second problem is the *dating* of separate eras. Rosecrance finds nine eras between 1740 and 1960, while Singer and Small arbitrarily divide the data into two sets, 1815-1899 and 1900-1945. Further discussion of these analytical problems seems warranted before undertaking a comparative test of the relationship between stability and polarity.

Accordingly, the design of the research presented below will consist of an interweaving of analytical and empirical operations. Initially, the concept of "international subsystem" will be defined in such a way that analytical criteria can be used to detect subsystem arenas and members therein. For each of these entities, or units of analysis, it will be necessary to assemble indicators of the independent variable—stratification—and the dependent variable—stability. *Stratification* may be defined as the distribution of resources within a subsystem, including such elements as the number of members, their relative power, alliance ties between members, and an aggregate judgment as to the number of power centers on military-strategic questions. Analytical criteria determine the nature of the entities, so some variables will record the intuitive ratings upon which the study is based. Data on alliances have been provided by Singer and Small, and judgmental assessments by Rosecrance will be used in order to discover with which phenomena they are most closely associated. *Instability* of subsystems is empirically defined as the number of wars of various types. The total number of variables is 68, so to achieve an overview of the data multivariate procedures will be applied. First of all, the independent and dependent variables will be separately factor analyzed to ascertain the empirical structure for each set of measures; through this means we will know whether there are distinct types of stratification and instability, thus broadening the scope of the original bivariate question of a relationship between stratification and instability into a task of determining which kinds of stratification are related to what kinds of instability. Secondly, the dependent and independent variables will be analyzed together in order to discover whether the power structure of an international subsystem in fact is a concomi-

tant of one or another type of instability in the behavior of members of the subsystem. The cross-running of dependent and independent variables will be handled by factor analysis, smallest space analysis, and cluster analysis. All three of these techniques are taxonomic in character, inasmuch as they describe clusterings of data; none actually "test" hypotheses in the classic manner prescribed by textbooks on inferential statistics, but they have the virtue of identifying close associations between variables which remain when all other variables are being held constant and, therefore, are among the most powerful tools of descriptive statistics.

II. IDENTIFYING INTERNATIONAL SUBSYSTEMS

An *international system* may be defined as an aggregation of all politically autonomous and semiautonomous societal systems; any subset of such entities, thus, constitutes an *international subsystem*.¹⁰ As James Rosenau has suggested, however, there can be as many systems as "issue areas."¹¹ In testing the stability-polarity hypothesis, hence, we are not interested in just any system; our attention is directed toward systems containing *military-strategic* confrontations between poles of actors. To regard Ecuador-Ethiopia as a relevant subsystem would be as much a potpourri choice as to select all national actors for the year 453, whether they knew of each other's existence or not; we need precise criteria for determining membership in an international subsystem which are phrased in terms of how member states relate to one another militarily.

Harold Lasswell's notion of *arena*, accordingly, will be utilized in order to locate groups of states that interact with each other on strategic and political matters.¹² When there was little

¹⁰ A common semantic trap is to say that a "system" exists only when it reaches some sort of threshold level in frequency of social interactions. Certainly it is more consistent with general systems analysis to define a *system* as any set of parts that are related in some way; and a classification of all types of relations would clearly be incomplete without the category "interacting," for which one could assemble data to differentiate systems interacting at high and low levels. Entities, in short, are to be described with reference to conceptual variables, instead of being defined mystically in terms of thresholds. Such an approach is consistent with the "constructivist" systems approach advocated by David Easton, *A Framework for Political Analysis* (Englewood Cliffs: Prentice-Hall, 1965), pp. 30-34.

¹¹ Rosenau, *op. cit.*

¹² Harold D. Lasswell and Abraham Kaplan,

interaction of any kind between states in China, Europe, India, and among tribal groups in Africa and the Americas, international arenas relevant to military-strategic issues were isolated from each other and more easily identifiable.¹³ Today penetration by thermonuclear giants into the affairs of miniscule states seems to be taken for granted. Nevertheless, it is axiomatic that Africa has had little impact upon international politics among European states; moreover, only a few European countries ventured into Asia to establish a military presence, and such countries as France and the United States were able to entertain similar policies toward the Hawaiian Islands while in sharp disagreement on relations with Mexico in the 1860's. Such considerations lead to the conclusion that actors within military-strategic arenas in Europe, Asia, Africa and other regions of the globe are by no means identical. Within international regions, power distributions and configurations may differ both over time and from one part of the globe to another. The network of all military-strategic interactions among militarily autonomous units, hence, would have a number of subclusters at any one time point, and the denser parts of the network would constitute *international military-strategic subsystems*. But we need guidelines for determining which subclusters may qualify as international military-strategic subsystems.

Following a set of criteria developed by Michael Brecher for locating boundaries between regional clusters of states,¹⁴ we may identify international subsystems in terms of three elements:

- I. Scope is delimited, with primary stress on a geographic region.
- II. There are at least two actors.
- III. There is a relatively self-contained network of political interactions between the members, involving such activities as goal attain-

ment, adaptation, pattern maintenance, and integration, and dealing with power relations and military interactions.

These criteria are to be applied in section III of this paper to the extraction of 21 subsystems from Europe, Asia, and Hawaii, although many more subsystems are possible. The best approach would be to analyze communication networks relevant to conflict. Unfortunately relevant data for mapping military-strategic interactions are not available for long sweeps of time. A second-best approach for determining boundaries between international military-strategic subsystems is to devise specific criteria for sorting members from nonmembers of subsystems, once the subsystems have already been identified in an intuitive manner.

In delineating *members* on the basis of their participation in arenas of military conflict it is important to avoid the legalistic trap of including only so-called sovereign states, especially in an age when contests involving such entities as the Vietcong guerrillas could ultimately threaten the very survival of the human race. Adapting Singer's and Small's suggestions for selecting members,¹⁵ the following criteria for determining membership in an international political-strategic subsystem would seem provisionally useful:

- I. A member must interact more or less continuously in a manner relevant to political-military goal attainment, adaptation, pattern maintenance, and integration.
 - (a) The existence of diplomatic interaction neither confers nor denies membership per se, but when an actor displays considerable diplomatic interaction with another actor, the two are members of the same subsystem.
 - (b) An entity entering into an alliance gains membership in the same subsystem as the other alliance partners.

Power and Society (New Haven: Yale University Press, 1950), pp. 78-80, 252-54.

¹³ William McNeill, *A World History* (New York: Oxford University Press, 1967).

¹⁴ Michael Brecher, "International Relations and Asian Studies: The Subordinate State System of Southern Asia," *World Politics*, XV (January, 1963), 221-35. For a more complete justification for the criteria, which are three fewer than Brecher's original formulation, see Michael Haas, *International Conflict* (Indianapolis: Bobbs-Merrill, forthcoming), Ch. IX. The concept of *subordinate* system, which seems to have meaning only when applied to a set of actors that are satellites of some superordinate state, thus is not relevant here.

¹⁵ Singer and Small, *op. cit.*, use two criteria—diplomatic recognition by France or England, and a population of 500,000 or more. These criteria would of course exclude the Vietcong and other actors which, though subnational, are clearly militarily independent and internationally active due to their confrontation with countries outside of the state of which they are supposedly a part. See their "The Composition and Status Ordering of the International System," *World Politics*, XVIII (January, 1966), 236-82; Bruce M. Russett, Singer, Small, "National Political Units in the 20th Century: A Standardized List," this *Review*, LXII (September, 1968), 932-51.

- (c) Members must have a minimal level of internal political organization. (A rebel political faction may qualify, but a social group or ethnic community is excluded.)
- II. A member must possess military viability.
 - (a) All units with a population exceeding 500,000 are members, though smaller units may qualify.
 - (b) All sovereign states engaging in war in the relevant region are members.
 - (c) Membership ceases when an actor is absorbed or conquered and occupied.
 - (d) A separatist faction is a member (1) if it is a participant in an initially internal war in which one or more major and middle powers have intervened, or (2) if it eventually succeeds in achieving political autonomy as a separate state.

Either characteristic, if present, would suffice for an entity to qualify as a member of an international military-strategic subsystem. Such criteria would encompass states that have been militarily neutral for centuries, though diplomatically in a particular arena, such as Sweden in Europe; piratical bands would be excluded; and a country like the United States would date its entry into North American subsystems as soon as rebel armies acted independently of Great Britain. International subsystems, thus, consist of sets of entities meeting criterion I or II and interacting with each other in the same military-strategic arena.

Time boundaries for historical eras containing distinct parties and issues in conflict remain to be determined. Power stratification and alliance confrontations hardly remain constant over time, and the impact of certain wars between major powers has often been to transform the stakes of conflict dramatically among countries.¹⁶ Specifically, we may use Rosecrance's notion of *polarity* and Kaplan's concept of the *tightness* or *looseness* of a system¹⁷ to identify a

subsystem transformation when *either* of the following two conditions occurs:

- I. A new system begins if there is a change in the number of poles, such as the following:
 - (a) a major power is demoted through military defeat,
 - (b) one or more middle powers rise to major power status,
 - (c) a major power enters the system anew or exits from the region,
 - (d) new military alliances involving major powers arise,
 - (e) existing military alliances involving major powers collapse or membership reshuffles.
- II. A new system begins when a dramatic event precipitates a trend toward tightening or loosening in power distribution, such as the following:
 - (a) a previously nonaligned power becomes an exclusive ally of another major power,
 - (b) an alliance among major powers develops a schism,
 - (c) many nonmajor powers become attached to, or break off from, bloc arrangements,
 - (d) pluralistic security communities wax or wane.

The demotion of France from the rank of major power in 1871, and Germany's *dénouement* in 1918, hence enable us to fix definite endpoints for old systems and starting points for new subsystem eras, just as the disruption of unity among the major powers of Europe and Hawaii were system-transforming events in 1822 and 1759, respectively.

For the reader who would prefer a quantitative approach to the identification of subsystems, cluster analysis, smallest space analysis, or factor analysis could be performed from a matrix of military-strategic interaction targets for a large number of years. Frank Denton, in undertaking a P-factor analysis of wars since the second decade of the nineteenth century, has, for example, supported Rosecrance's dating of historical subsystems.¹⁸ Had his study failed to

¹⁶ The "stakes of conflict" criterion is proposed by Stanley Hoffmann, "International Systems and International Law," *World Politics*, XIV (October, 1961), 205-37; cf. Robert L. Rothstein, "Power, Security and the International System," paper presented to the American Political Science Association Annual Convention, Chicago, September, 1967; Hoffmann, *The State of War* (New York: Praeger, 1965).

¹⁷ Kaplan, *op. cit.* For a clarificatory essay, see Wolfram F. Hanrieder, "The International System: Bipolar or Multibloc?" *Journal of Conflict Resolution*, IX (September, 1965), 299-308.

¹⁸ Frank Denton, "Some Regularities in International Conflict, 1820-1949," *Background*, IX (February, 1966), 283-96. Denton analyzes data on wars collected by Lewis F. Richardson, *Statistics of Deadly Quarrels* (Chicago: Quadrangle, 1960). The most exact validation procedure for subsystems defined in terms of poles and looseness would consist of an R-analysis of the number of poles recorded for each year in the years to be studied and a measure of the extent of looseness (or failure to pull all members of a system into one or more of the contending poles). Ordinal data to

TABLE 1. INTERNATIONAL SUBSYSTEMS

support the intuition of a highly knowledgeable scholar, however, the criteria would not have been changed drastically, for some sort of analytical cuts are always prior to the selection of data for analysis. It is important to justify these cuts theoretically, as we have done, and to obtain precise estimates of the extent to which one's analysis is procrustean, a task to be discussed below in section IV.

III. EUROPEAN, ASIAN AND HAWAIIAN SUBSYSTEMS

Specifying territorial and time boundaries for international subsystems in practice involves a great deal of trial and error experimentation. Whether to decide first upon members or upon years presents a chicken and egg dilemma. The most painless procedure has been to posit "core members" of subsystems, and then to fix an arbitrary starting point in time.

For Europe the most obvious core members are France, England, Spain, Prussia (Germany), and the former Austrian Hapsburg Empire. The date of 1649 could be selected as a starting point because in that year the Peace of Westphalia had concluded the Thirty Years War by redrawing European boundaries. But in order to transcend the parochialism of a completely European sample, additional subsystems are to be

construct such indicators is not easily at hand, and since we have already assigned 0 and 1 codings implicitly in the discussion to follow, an R-analysis of nominal scale codings would doubtless be a trivial exercise.

carved out. China and Japan are central members of any East Asian subsystem. We may begin our analysis in 1689, when China signed its first modern treaty (with Imperial Russia), the effect of which was to slow down Russian expansion in Asia. Until the unification of the Hawaiian Islands by King Kamehameha I in 1810, the various rulers of the islands Hawaii, Oahu, and Maui were at the helm of the most significant members of Hawaiian subsystems. Foreign penetration, which did not occur until the late eighteenth century, was undertaken by France, Great Britain, Russia, and the United States. A lack of earlier records dictates as an initial year the choice of 1738, when a conference between the kings of Oahu, Maui and Hawaii resulted in a ceasefire of a war that might otherwise have meant the unification of the islands under the joint rule of Alapainui of Hawaii and his brother, Kamehamehanui of Maui.

Many other subsystems could have been chosen—African, American, Middle Eastern, and South Asian, for example. In this preliminary analysis a small sample, 21 subsystems in all, is preferred so that familiarity with each case would be maximized while at the same time there would be enough cases for multivariate manipulation of the data. The subsystems to be analyzed are presented in Table 1, along with a summary of all codings judgmentally assigned in accordance with our criteria for detecting poles and members of subsystems. Figures for number of major powers, members, and satellite states

are based on the Singer-Small lists, as modified by membership criteria presented in section II of this paper. Poles, availability of resources, regulator strength, and level of disturbance codings are taken from Rosecrance for subsystems II-X and supplemented in a manner that seems consistent for the remaining eras.¹⁹ Although detailed descriptions of the eras appear elsewhere,²⁰ a brief summary is presented here to justify the judgmentally assigned codings and to substantiate the analytical cuts (in space and time) for each of our 21 subsystems.

Rosecrance's European subsystems may be capsulized as follows: (I) *Western Europe 1649-1713*, Louis XIV opposed by coalitions on three occasions; (II) *Europe 1714-1789*, evanescent alliances among jockeying major powers; (III) *Europe 1790-1814*, revolutionary France establishes a system of satellite states until finally checked by the Quadruple Alliance; (IV) *Europe 1815-1822*, five major powers maintain a tight

¹⁹ I wish to express my gratitude to Professors Charles Hunter, Werner Levi, and Norman Meller for offering assistance in my analysis of the Asian and Hawaiian materials. The scarcity of scholars able to assess my extraction of subsystems in Asia and Hawaii precluded a Delphi procedure such as the one apparently undertaken by Rosecrance. See Rosecrance, *Action and Reaction in World Politics*, op. cit., p. x; Olaf Helmer, *Convergence of Expert Consensus Through Feedback* (Santa Monica: Rand, 1964). I have altered the dates of some of Rosecrance's subsystems so as to eliminate overlapping years, thereby enabling a smoother data collection procedure.

²⁰ M. Haas, loc. cit. The European eras are most succinctly described in Mowat, op. cit.; David Jayne Hill, *A History of Diplomacy in the International Development of Europe* (New York: Longmans, Green, 1914); and Rosecrance, *Action and Reaction in World Politics*, op. cit. For Asia, see Harold M. Vinacke, *A History of the Far East in Modern Times* (6th ed.; New York: Appleton-Century-Crofts, 1959); Harley F. MacNair and Donald F. Lach, *Modern Far Eastern International Relations* (2nd ed.; New York: Van Nostrand, 1955). The major sources on Hawaii are Abraham Fornander, *An Account of the Polynesian Race* (vol. II; London: Trubner, 1880); Ralph S. Kuykendall and A. Grove Day, *Hawaii* (rev. ed.; Englewood Cliffs: Prentice-Hall, 1961); Kuykendall, *The Hawaiian Kingdom, 1854-1874* (Honolulu: University of Hawaii Press, 1953); Sylvester K. Stevens, *American Expansion in Hawaii, 1842-1898* (Harrisburg: Archives Publishing, 1945). A more monographic presentation would be preferable, so the reader should consult sources cited in these works for more complete accounts.

concert of Europe reign; (V) *Europe 1823-1847*, France-England and Prussia-Russia-Austria maintain separate spheres of influence; (VI) *Europe 1848-1871*, major powers disband the concert and their spheres of influence; (VII) *Europe 1872-1890*, alliance network with nexus at Berlin, France isolated; (VIII) *Europe 1891-1918*, antagonism between Triple Alliance and Triple Entente; (IX) *Europe 1919-1945*, France sets up an alliance framework isolating Germany until Hitler establishes the Axis pole; (X) *North Atlantic 1946-1963*, Soviet and Western blocs engage in a cold war struggle.

Since the Asian and Hawaiian subsystems are not discussed in any previous source, our description is more detailed:

(XI) *East Asia, 1689-1842*. After the abortive Russian Amur Expedition of 1689, the East Asian international subsystem was reaffirmed to be unipolar in character, though in the later years of China's long hegemony in the Far East her supremacy was assumed loosely to exist without a concerted attempt to test her strength. China was the only major power, with Japan and Russia as abdicating middle powers.

(XII) *East Asia, 1843-1895*. The easy victory of England in the Opium War changed the East Asian power situation dramatically. Although capitalist states were interested primarily in trading privileges, decentralization of power throughout China encouraged Western powers to cooperate in a tight bipolar struggle to enlarge "spheres of interest" in China. The Opium War brought France, Great Britain and Russia to major power status. The Netherlands, newly colonizing in the East Indies, and Spain, with control in the Philippines, constituted new middle powers linked to the bipolar struggle of East versus West. And the Western powers began to assume an implicit regulatory role in East Asia.

(XIII) *East Asia, 1896-1913*. When Japan unexpectedly proved victorious in its war with China in 1894-95, France, Germany, and Russia, exercising an explicit regulatory role, compelled Japan to revise the terms of the Treaty of Shimonoseki, thereby creating an independent Korea and reducing the likelihood that Japan might use some clauses of the treaty as a shoehorn to continental domination. Bipolarity resulted. The absorption of Great Britain, Germany and the United States with matters outside East Asia meant a loose, rather than a tight stratification of power. Russia served as the protector of China, and France's European-oriented alliance with Russia constrained any aggressive Asian ambitions the latter might have contemplated. Insofar as Russia's cooperation with China appeared to tip the scales on the side of a future Russian

hegemony in Asia, the British became disturbed and formed the Anglo-Japanese Alliance in 1902, which initially encouraged Japan to tackle Russia in 1904, but the Japanese were content to accept American mediation in 1905 for a settlement restoring a loose bipolarity in East Asia. China and Russia were demoted to middle power status due to their wartime defeats in 1895 and 1905, respectively, and the United States entered the system as a middle power upon unseating Spain from the Philippines in 1898.

(XIV) *East Asia, 1914-1945*. The outbreak of World War I in Europe provided an unparalleled opportunity for Japan to increase its power in the East Asian subsystem without regulatory countermeasures. As of 1917 both Russia and China ceased to be unified entities within the system, and the Western powers were consumed first with the European world war, and with internal economic reconstruction afterwards. Japan agreed at the Washington Conference of 1921 to a distribution of power in which it would be "balanced," but the 5:5:3 ratio in naval strength left Japan as the number one power in East Asia. The Manchurian invasion of 1931 and the subsequent establishment of the puppet state Manchukuo were contested only verbally. Japanese forces moved southward to conquer China in 1936. Aid for the Chinese was provided by Moscow, reinforcing a tripolar constellation composed of Japan, Russia and China, and as yet uncommitted Britain, France, and the United States. After the Pearl Harbor bombing in late 1941, Japan was opposed by nearly every other power in Asia, though there was no joint allied command.

(XV) *East Asia, 1946-1954*. The immediate postwar period consisted of a bipolar contest. The United States established a military presence in Japan and Okinawa, while the increased power of the USSR in Asia became a new factor. Victory by the Chinese Communists over the Kuomintang was finally achieved by 1949, and the system tightened in 1950 with the outbreak of the Korean War, the American and UN regulatory response to which underscored a policy of containment of Communism.

(XVI) *Asia, 1955-1963*. Seeds of a three-cornered alignment were sown in 1951, when United Nations' forces crossed the 38th parallel into North Korea over the objections of India. Delhi, a middle power in South Asia, withdrew her support from the United Nations' action and began to proselytize on behalf of a policy of nonalignment. The independence of several states in Southeast Asia, and French withdrawal from Indochina and India by 1954, played into India's hands as the leader of a new grouping of states.

Following Indonesia's acceptance of a neutralist foreign policy and the Bandung Conference of 1955, tripolarity was established on firmer ground. With the Indochinese buffer gone, the East Asian subsystem merged with the formerly separate South Asian international subsystem. A period of peace was guaranteed by the cohesiveness of neutralists, activity of the UN, and parity between the power blocs of East and West. Escalating participation of the United States in Vietnam, possession of thermonuclear weapons by China, the Sino-Indian Border War, Pakistan's estrangement from the American-sponsored SEATO pact, and the rift between Malaysia and Indonesia brought an end by 1963 to the tripolar house of cards constructed by the neutralist bloc.

(XVII) *Hawaii, 1738-1753*. The forces of Alapainui, ruler of the island of Hawaii, nearly succeeded in unifying all of the major Hawaiian Islands in the year 1738. Alongside his brother, who was ruler of Maui, Alapainui's combined military force subdued Molokai and sailed for Oahu, where victory was almost certain but would be contested bitterly by Peleioholani, ruler of Oahu. Rather than pursuing what might be a pyrrhic victory, the three rulers agreed to a cessation of hostilities with Oahu and concluded the Treaty of Naonealaa, establishing an informal "concert," whereby any new war would be halted at the insistence of the third. A relatively peaceful era, with a loose trifurcation of power, followed.

(XVIII) *Hawaii, 1759-1782*. The Kapalipilo Battle between Maui and Hawaii ushered in an era of bellicose leaders, each militantly seeking to unify all of the islands. A Hawaii military expedition invaded Maui, successfully annexing the eastern section of the island. Maui, led by Kahekili, turned its sights on both Oahu and Hawaii, the former for conquest and the latter for revenge. A tight tripolar struggle ensued until 1782, when Maui conquered Oahu. Hawaii, meanwhile, was convulsed with internal discord. The heir to Kalaniopuu threatened to redistribute land in a manner particularly unattractive to the chiefs of the Kona district, who preferred Kamehameha, and a civil war followed for a ten year period.

(XIX) *Hawaii, 1783-1795*. After the victory of Maui over Oahu, Kahekili took up residence on Oahu, creating a power vacuum in the middle of the island chain. Kamehameha secured control of Maui, Molokai, and Lanai in 1790, even before his authority had been solidified on his home island, and the Kahekili-Kamehameha fight was continued up to 1795, when in the Battle of Nuuanu the army of Kamehameha pushed its opponent's forces up to the Pali precipice; those

who escaped plunging to their death did not contest the new hegemony of Kamehameha. All of the islands except Kauai and Niihau fell under the rule of Kamehameha I.

(XX) *Hawaii, 1796-1818.* Though Kamehameha's unipolar preeminence clearly dates from 1796, the existence of a last independent ruler spurred Kamehameha to sail to Kauai. After heavy storms forced his fleet of warships to turn back on two occasions Kamehameha softened the urgency of a victory that seemed inevitable. His patience was rewarded when Kaumaulii, the ruler of Kauai, declared a voluntary surrender in 1810. When a group of Russians, who had been encouraged by Kaumaulii to establish a colony on Kauai in 1796, departed in 1818, Kamehameha I assumed complete dominance.

(XXI) *Hawaii, 1819-1898.* The position of Kamehameha and his successors loosened considerably during the nineteenth century, though unipolar control was maintained. At various times such middle powers as France, Great Britain, and the United States contemplated forcing Hawaii into an imperialistic cockpit. France moved first in 1819, but soon realized that conquest would not be so easy. In 1843 an entente was reached between France and Great Britain, in which it was agreed that Hawaii should remain independent. The American president John Tyler was reluctant to go along with the 1843 agreement for fear that the specter of secret treaties, power politics, American imperialism and foreign "entanglement" would be vilified by the opposition party. In the last half of the century American and Oriental settlers arrived in great numbers, gradually taking over the commercial and economic control of the islands. In 1887 the United States gained a naval leasehold over Pearl Harbor, thus elevating Washington to the status of a major power, and two years later American marines were landed at the request of Kamehameha V in order to insure that the so-called Wilcox Revolt would fizzle. The monarchy fell in 1893 primarily at the instigation of the American settlers; a republic was declared in 1894; and the islands were annexed by joint resolution of Congress in 1898, terminating the autonomy of Hawaiian subsystems.

IV. DATA ON STRATIFICATION AND STABILITY

Our main aim of determining whether types of power distributions are related to the incidence of international conflict, requires that we assemble objective, quantitative data measuring the extent of power stratification as well as the extent of war participation within each of the analytically derived subsystems. We now turn to data on alliances and wars.

Data on international stratification, our independent variable, are available to us in the form of membership and polarity codings and alliance formation statistics. The alliance data, which cover only the period 1815-1945, have been collected principally by Singer and Small.²¹ Table 2 lists 33 variables indexing the power structure of each of our 21 subsystems. Variables 1-5 deal with the number of poles; variable 1 is recoded as a series of dichotomies in variables 2-5. Rosecrance's codings comprise variables 6-8. Membership assignments are presented in variables 9-15. Variables 16-19 represent gross counts of the number of alliances, their size, and the extent to which members of the subsystem are tied together by alliances. Variables 20-23 trace the extensiveness of alliance links between major and minor powers, thus yielding a measure of hierarchy in alliance formation, and variables 24-27 measure the extensiveness of the practice of major power alliances that are made exclusively with each other. Variables 28-33 represent measures of *procrusteanness*. It would be ideal in terms of our criteria to find that alliances are all terminated at the conclusion of a subsystem and new ones are begun as a subsystem starts. But this is not the case. Variables 28-30 measure the degree to which our dating of subsystems fails to coincide with the natural lives of alliances among members of each system. Geography, similarly, may be a source for procrustean slicing of subsystems, so variables 31-33 index the extent to which countries within a particular subsystem enter into alliances beyond the spatial confines of the main continent in which the subsystem is centered.

The variables might appear to be independent observations on the extent of stratification within an international arena. An analysis with 33 independent variables, however, would hardly be parsimonious. If subsets of the variables empirically collapse into highly intercorrelated clusters, our analysis would be simplified. Accordingly, a *factor analysis* of the alliance data is reported in Table 2.²² Unfortunately the data

²¹ Singer and Small, "Alliance Aggregation and the Onset of War, 1815-1945," *loc. cit.* I have supplemented these data with a compilation of alliances between members of the five Hawaiian subsystems based on Fornander, *loc. cit.* Definitions of each variable appear in the Appendix to this paper. Data are available upon request from the author.

²² Since none of the variables depart significantly from normal curve distributions, though they tend to be rectangular in view of the small sample size, product-moment correlations were computed be-

do not condense themselves as much as we could wish, for a total of nine factors emerge, which is quite unusual for so few variables. The first two factors account for about half of the total variance of all of the variables, but the remaining factors taper off so gradually that we must include them in any complete description of the elements of stratification within international subsystems.

The most important factor²³ is clearly a *Size* factor, inasmuch as variables counting the total number of alliances, members, and of major-minor alliances consistently receive high loadings along with numbers of members, major powers, and most other variables given in gross magnitude form. The most significant element of an international subsystem emerging from 33 measures of stratification, then, is whether it has many or few members and alliances, in keeping with the primacy attributed to the variable of size by Deutsch and Singer. European subsystems are large, Asian systems medium, and Hawaiian systems small, and this basic dimension is unrelated to the eight other facets of stratification. The second factor is *Procrusteaness*. Such a large representation of variables 28-33 in this factor indicates that subsystems differ greatly in the extent to which they contain alliances that are a legacy of the past or that will endure despite power reshufflings, as opposed to subsystems with alliances made only specific to the power confrontation of the period, on the one hand, or cosmopolitan members who contract alliances with members in other subsystems versus those subsystems that are insular in

tween the 33 variables. A principle axis factor analysis, with 1.0, was run, and there was a negative eigenvalue on the 14th cycle. An orthogonal (varimax) rotation, after determining the number of factors from the eigenvalue 1.0 criterion, approximated simple structure, so a quartimin rotation was performed, using an oblimin program developed by John Carroll; gamma was set at 0.0, and the solution ran 30 cycles, 13,500 iterations. A bi-quartimin rotation was tested but, in conformity with the observation that varimax was very close to simple structure, factor loadings were so greatly inflated in value as to be meaningless.

²³ Factor number assignments coming from the unrotated solution often do not correspond with oblique solutions; the unrotated factors, which are brought into a clearer form through an orthogonal rotation, denote a succession of factors starting with the most important (in terms of variance explained) and decreasing to the least important. Here we follow the numbering of the quartimin factors, for the sake of clarity in reading the results.

character, on the other hand. The high loadings for number of major and middle powers indicates that activity outside the system is more likely when there are many states potentially competing for topdog status. Some of our cuts made in time and space, in short, were much better than others, and since procrusteaness is an important dimension of the data, we are fortunate in being able to assess the exact extent to which it is related to aspects of foreign conflict delineated in the next section of this paper. Factor III is an *Alliance Saturation* dimension, since it groups together the per cent of countries aligned and the multilaterality of alliances. This dimension can be used in a retest of the hypothesis that alliances sometimes deter wars, and at other times serve as a prelude to wars. The fourth factor refers to *Blocs*, containing as it does high loadings for bipolarity, unavailability of resources, major-minor alliances, as well as a tendency for alliance patterns among the major powers to remain solid from one subsystem era to the next. Waltz' adulation for the success of the contemporary cold war in preventing various disturbances from disrupting the stability of international relations can be examined more carefully with this dimension of stratification, which corresponds closely with Rosecrance's picture of a bipolar world. *Differentiation* emerges as a fifth factor. Subsystems evidently differ significantly in the presence of a layer of middle powers intervening between major and minor powers, and a low number of alliance ties on the part of intrasystem members with countries in other subsystems. A situation in which there is a wide gulf between powerful and weak members is thus related to the geographic isolation of a subsystem; and, conversely, subsystems that are penetrated by outside powers tend to contain almost as many middle and major powers. The fact that *Multipolarity* appears as a sixth factor, however, demonstrates that interaction opportunities are unrelated to the tendency for systems to contain many or few poles. The fact that alliance membership, size, and multipolarity are unrelated undercuts one of the assumptions in the Deutsch-Singer formulation. The per cent of all actors that are satellite states or militarily active subnational groups attracting the attention of outside powers was the basis for calculating a percentage of nonsovereign members, which loads high and negatively on the seventh factor, along with the tightness of a subsystem, and it seems intuitively reasonable to expect fewer amorphous entities in a loosely structured system. Accordingly, we shall refer to this factor as *Tightness*, even though the nonsovereign variable has a somewhat higher loading.

The interfactor correlations among the first seven factors are all below $\pm .50$, so they are not presented in a table here, but some are above $\pm .40$: (1) procrustean systems are seldom bloc systems, though they are tight; (2) blocs are generally tight. Factors VIII and IX, however, collapse almost completely, for they correlate with each other at the $-.85$ level, and they are correlated with factors II, IV and V at the $.70$ level or higher. The much lower percentages of variance explained by the two final factors indicates that they may be tapping some random error in the data.²⁴

Turning to the dependent variable, international stability, it is possible to utilize a number of lists of wars, their duration, casualties, and countries participating in each instance of international violence. Lewis F. Richardson's *Statistics of Deadly Quarrels* is the most detailed in coverage, for it includes many subnational entities and internal wars as well as the more traditional case of hostilities between separate, legitimate sovereign states, though there are no data before 1820, after 1950, or concerning the Hawaiian islands. It will be necessary to supplement the list, therefore.²⁵ A second source is Quincy Wright's *A Study of War*, which counts the number of wars with "formal declarations" for a much longer time period, but his compilation tends to ignore subnational participants.²⁶ Because findings could be highly dependent

upon the way in which data are collected in each study, one way of proceeding is to conduct two separate analyses, one for each source. Table 3 contains variables collected from Richardson, and Table 4 lists similar variables from Wright. Independent analysis with the two sets of data will permit replication and thus strengthen the overall conclusions from this study.

In Table 3 the indicators fall into several categories. Variables 34-39 sum war data across all countries; the same types of indicators are next counted for major powers only in variables 40-44. The effect of wars is dealt with in variables 45-47, with *destabilization* defined as victory in a war on the part of the aggressor, which can be determined from the description of each quarrel in Richardson's compilation. Extrasystem warfare is indexed by variables 48-51, and Rosecrance's "level of disturbance" coding is included as variable 52 in order to ascertain what sorts of quantitative data are most applicable. A factor analysis of the data, also reported in Table 3,²⁷ is much less complex in structure than the alliance data. Only 6 factors emerge from the 19 variables, the first two factors accounting for about 60 per cent of the total variance, and the high communality (h^2) estimates reveal that there is little unexplained variance among the variables. The factors are themselves easier to name.

Factor I is a *War Incidence* dimension, with high loadings for many wars and many new wars for both major and all other powers. International subsystems, hence, differ greatly in the amount of violence present, some being much more peaceful than others, but the gross extent of violence is independent of five other dimensions of war. Factor II is a *Multilateral* factor, with high codings for war deaths, Rosecrance's coding for disturbance, and with the tendency for wars to have many rather than few participants. The strength of a regulator, thus, is most taxed in world wars and in major confrontations among several states but is unrelated to the

²⁴ Factor VIII seems to indicate Imperial Expansion; IX, Imperial Decline.

²⁵ Richardson, *op. cit.*, pp. 33-111. The supplementary sources are Fornander, *loc. cit.*, and data supplied by Mr. Richard Cady, Bendix Systems Division, Ann Arbor, from a study of low-intensity warfare sponsored by the Office of Naval Research, Contract NC0014-66-CO262.

²⁶ Quincy Wright, *A Study of War* (2nd ed.; Chicago: University of Chicago Press, 1965), pp. 644-49. In view of his more formal criteria it would not appear consistent to add Hawaii data to his list; for the same reason I have deducted subnational members from the total number of members in norming variable 54, as well as 17 and 19. Two other sources, Singer and Small, and Sorokin, employ restrictive criteria that made their lists less useful for the particular purposes of this study: Singer and Small do not include interventions, and their data pertain only to 1815-1945; Sorokin assembles data only for about 10 countries, though over a very long time period. Singer and Small, "Alliance Aggregation and the Onset of War, 1815-1945," *loc. cit.*; Pitirim A. Sorokin, *Fluctuations of Social Relationships, War and Revolution* (New York: American Book Company, 1937), pp. 547-77.

²⁷ A principal axis factor analysis was performed on the 19×19 correlation matrix with unities in the diagonal. Six factors emerged with eigenvalues over 1.0, and negative eigenvalues were encountered on the ninth cycle. An orthogonal (varimax) rotation was next run, and the subsequent biquartimin solution (30 cycles, 9000 iterations) was virtually identical in higher loadings with the orthogonal solution though much cleaner with regard to intermediate loadings. Accordingly, only the biquartimin P matrix is presented in Table 3. The only high interfactor correlation is $-.60$, between factors I and V.

number of total wars. Theorists who are willing to abide many wars but cannot tolerate large losses of life will be more interested in factor II than factor I in the subsequent analysis. Factor III consists of two main *Extra-Era* variables, and factor V is an *Extra-Region* dimension. Unlike the pileup of procrustean indicators in the case of alliances, the time and space variables appear here on different factors. *Destabilization* appears as factor IV. Evidently long wars are largely capable of achieving the aspirations of aggressive states. The close association between destabilizing wars and subsystems with many war participants evokes an image in which countries gang up on powers that are on the decline, such as the Ottoman Empire in nineteenth century Europe. But the $-.60$ correlation between factors I and IV suggests that wars in eras with destabilization are likely to be infrequent. The final factor contains a cluster of *Major Power Wars*. International subsystems containing many major powers at war, to summarize at this point, are equally likely to have many or few total wars, extrasystem wars, war casualties, stabilization or destabilization as a consequence.

Our next question is whether a similar clustering can be found in Quincy Wright's data, which is exhibited in Table 4. Nearly all of the indicators are identical in form with those collected from Richardson, to facilitate such a replication, but Wright provides no destabilization clues and no figures for war deaths. As a partial substitute, casualty estimates collected by Singer and Small, which correlate $+.79$ with those of Richardson but are based on criteria more similar to Wright than to Richardson, are inserted. Evidently because it was impossible to use supplementary data for destabilization, only five factors are extracted from the 17 Wright variables. The first two factors again account for about 60 per cent of the total variance. Several variables, however, fail to enter into the results, especially Rosecrance's disturbance level.²⁸

Multilaterality is the first factor, with variables pertaining to the number of participants per war receiving higher loadings than war casualties, unlike the corresponding factor for Richardson's data. The fact that "participants in

wars/wars" and "participants in wars/members at war" end up on different factors may seem paradoxical, but evidently belligerents in particular wars are sometimes recidivists and at other times newly play the role of war participant. One cannot predict from the presence of mainly dyadic or multilateral wars whether the subsystem has had many or few total wars. *War Incidence* is factor II for Wright; unlike the same dimension in Richardson's data, there is a stronger linkage with the number of different countries entering war. Some subsystems, in other words, have few wars and few countries at war, while other subsystems are arenas in which nearly every member fights on the battlefield and a new war breaks out in many years of the total life of the era. Few members enter wars outside such turbulent subsystems, perhaps due to the excessive preoccupation with events in the wartorn region. *Extrasystem Wars* are found together on factor III. Although factor V does contain a high loading for *Extraregional Major Power Belligerency*, this final factor is a unique one, is the least important in terms of variance explained; it does not collapse into factor II, with which it is correlated $-.70$. Factor IV is a *Duration* dimension. Richardson's data contained a factor in which variables relating to length of wars also clustered, but we labelled that factor "destabilization" because the two variables loading most significantly were measures of the tendency for aggressors to upset the status quo. Lacking such indicators for the Wright data, we should not be surprised to find this result.

One factor missing from the factor analysis of Wright's war data is the sixth factor from Richardson, namely, *Major Power Wars*. Wright's focus on wars that have formal declarations and sovereign participants does of course weight the sample in the direction of major power wars, in contrast with Richardson's enumeration of wars including such entities as the Portuguese Miguelites and Vietnamese insurgent groups before the independence of the Vietnam republics.

To sum up this section of the discussion, we have collected 68 indicators of international stratification and instability, and factor analyzed the independent and dependent variables separately. Stratification variables are grouped together in seven major clusters: Size, Procrusteaness, Alliance Saturation, Blocs, Differentiation, Multipolarity, and Tightness. (Imperial Expansion and Decline emerge as the final two factors.) To determine relationships between international power stratification and stability these seven to nine factors, hence, must be juxtaposed with Richardson's and Wright's data on

²⁸ The Pearsonian 17×17 matrix input to a principal axis factor analysis with 1.0 in the diagonal. Five factors emerged with eigenvalues over 1.0, and a negative eigenvalue terminated the run on the eleventh cycle. An orthogonal (varimax) rotation was performed and a subsequent biquartimin rotation took 30 cycles, 16469 iterations. The only high interfactor correlation is $-.70$, between factors III and V.

wars. For Richardson the respective dimensions of international stability are War Incidence, Multilaterality, Extra-Era, Destabilization, Extraregionality, and Major Power Wars. Wright's data contain all but the last of these factors, though the clusters are somewhat differently formed and ordered (Multilaterality, War Incidence, Extrasystem Wars, Duration, Extraregional Major Power Belligerency).

V. STABILITY AS A FUNCTION OF POWER STRATIFICATION

With seven to nine dimensions of the independent variable and five to six dimensions of the dependent variable, an inventory of the total findings of this study might fill 50 or so cells of an interfactor correlation matrix, which is hardly a parsimonious prospect, though of course slightly more so than a 68×68 matrix of intervariable correlations. We have elected to pool the variables together, therefore, in order to determine whether some of the original power stratification factors collapse into the major dimensions of international stability.

A factor analysis of the dependent and independent variables together might seem to be the most obvious course available. There are some pitfalls in using factor analysis in hypothesis testing, however. The end product of factor analysis can only be a set of vectors, each of which contains variables whose high intercorrelations remain even when all other variables are held constant; thus, factor analysis is ideal for determining when the null (no-relation) hypothesis is correct, since each factor will be noncorrelated with every other. But even when looking at simple correlations, a high correlation beckons us to be suspicious that the relationship is between two variables that are fundamentally the same anyway, and thus is a trivial one. For the same reason the results of a factor analysis are likely to ferret out only the most obvious sorts of likenesses between dimensions. But, if we seek to test a hypothesis involving variables that are from substantially different theoretical realms, we will want a technique that is intermediate in power between the simple correlation coefficient and the extreme rigor of factor analysis; a technique that scales or sorts out close from weak relations might be better suited for our purposes. Accordingly, smallest space analysis and cluster analysis are to be employed below.²⁹

²⁹ Louis Guttman, "A General Nonmetric Technique for finding the Smallest Coordinate Space for a Configuration of Points," *Psychometrika*, XXXIII (December, 1968), 469-506; Joe H. Ward, Jr., "Hierarchical Grouping to Optimize on Ob-

Richardson's data are examined along with the stratification variables, using both smallest space analysis and factor analysis. Patterns in the latter, as expected, are often difficult to discern, and thus are not presented here.³⁰ Few of the nine dimensions of the independent variable either remain intact or collapse along with one of the six dimensions in Richardson's war data. The first factor, however, does juxtapose Multipolarity with the War Incidence factor. Multipolar systems, thus, have many wars involving major as well as minor powers; there are many new wars per year in a multipolar system, and many different countries enter these wars.

Our attention is directed instead at the results from *smallest space analysis* (Table 5 and Figure 1).³¹ In contrast with the factor analysis, the picture in Figure 1 portrays considerable proximity between variables. Looking more closely at the main independent variables, one sees unipolarity to the far left, tripolarity on the far right, multipolarity at the bottom, and bipolarity embedded in the north-central portion of the configuration. We may infer that each type of power distribution is uniquely associated with

jective Function," *American Statistical Association Journal*, LVIII (March 1963), 236-44. The specific code names are SSA-I for the former, and Cluster IV for the latter.

³⁰ The 52×52 correlation matrix in the diagonal. Twelve factors were extracted with eigenvalues greater than 1.0, and negative eigenvalues appeared on the fourteenth cycle. An orthogonal (varimax) rotation was performed but so many communalities exceeded 1.0 (due to missing data) that it was impossible to obtain a meaningful oblique solution.

³¹ The storage limitation for smallest space analysis on the IBM 7040 at the University of Hawaii Computing Center was 50 variables, so the stratification data (33 variables) were reduced by two variables in the analysis with Richardson's data (19 variables). The excluded variables were number 1 (number of poles), which has emerged on the same factor with multipolarity in every run attempted with factor analysis, and variable 27, which has similarly been so related with another variable (number 26) as to be superfluous in a larger analysis. Isobars in the SSA-I figures are drawn around variables on the basis of loadings $\pm .50$ in the factor analyses reported in Tables 2-4. Lower case Roman numerals refer to the stratification factors; upper case, to Richardson's dimensions in Figure 1, and to Wright's dimension in Figure 2. Labels are not attached to each variable number, since the names given in Tables 2-3 are so lengthy that they would clutter the plot unesthetically.

some variables, but much less so for other variables; following Rosecrance, we may read the figure in terms of the respective costs for each.

Unipolarity is surrounded mainly by stratification variables, such as resource availability and extraregionality of alliances, which is reminiscent of the Imperial Decline and Expansion factors in the preliminary analysis of the 33 independent variables. If we search for a cost of unipolarity in terms of warfare, the only rele-

vant variables are extraregional wars. *Bipolarity*, though apparently related to a larger number of variables, in view of its centrality in the plot, in actuality is located amid stratification variables. A bipolar system will evidently encourage minor powers to make alliances in other subsystems; there will be many alliances of all types; many satellites and middle and minor powers will be present. The main systemic cost is the tendency for longer wars, which often spill over into adjacent eras, with major powers frequently drawn into military confrontations. *Tripolarity* proves to be very explosive and is associated much more with war than with stratification variables. Tripolar systems will have more countries simultaneously fighting on the battlefield; there will be many ongoing wars and many new wars each year. Clearly the tripolar systems, which in our sample appear in modern Asia and pre-unification Hawaii, are much more eventful and crisis-ridden than bipolar systems. *Multipolarity* is associated most closely with such remaining stratification variables as exclusive major power alliances and indicators of Alliance Saturation. Destabilization and War Incidence are the main costs found in the widest arc around the multipolarity variable that does not intrude completely into the domains of bipolarity and tripolarity.

The dichotomization of types of power distribution into four variables according to number of poles evidently produces a configuration in which each of the four main types of polarities are at opposite ends from one another. With the exception of bipolarity, so few war variables are close to these extremes that alliance variables seem more predictive of international stability. As isobars in Figure 1 reveal, variables loading together at high levels on the respective factor analyses are found in adjacent locations in the smallest space plot. Among the alliance factors there is a tendency for the less important (low eigenvalue) dimensions to be situated on the left of the configuration and to be unrelated to war variables; the 19 Richardson variables are more widely scattered, though mostly on the right hand side. (Partial bounding by an isobar denotes that the other member of the relevant factor loads negatively and therefore is located at the opposite end of the plot.)

Variables indexing system size are located from north to side in the middle of the figure, virtually bisecting factors derived from Richardson's data. On the basis of the closest factors one may infer that a tight subsystem with many alliances, members, and minor powers allied to major powers is very likely to have many powers actively engaged in wars; the wars will be long, often spilling over into adjacent

FIGURE 1. Smallest Space Analysis of Richardson and Stratification Data^a

^a For key to variable numbers, see Tables 1 and 2. Upper case Roman numbers denote oblique factors from Table 3; lower case Roman numbers, oblique factors from Table 2.

eras, with many lives lost. In larger systems, there will be many outbreaks of warfare, especially among major powers, and the wars are likely to result in destabilization, that is, victory for powers trying to upset the status quo. The Deutsch-Singer interaction opportunity hypothesis, in short, is completely inconsistent with the findings of the smallest space analysis: we should look for smaller systems, with less so-called interaction potential, to bring about a more peaceful state of affairs.

Turning to the independent variables, which are bunched together at the south-central portion of the plot, we find that when members of a subsystem contract many alliances, both at home and in other regions, there is a tendency for these systems to have rival blocs. Such arrangements deserve the label *superblobs*, for the alliance tentacles extend to many arenas. The consequence of superblobs is for upsets of the status quo in both home and foreign regions, while War Incidence, Duration and Number of Countries involved in each war are much less distinctly related to the presence of superblobs. Most of the remaining stratification dimensions are more isolated from war variables. Alliance Saturation in a system breeds only Destabilization; Imperial Expansion and Decline are related to Extraregional Wars: a Differentiated system, as defined by a parity in major and middle powers and extraregionality in alliance

partnerships, is unrelated to war variables. These latter two sets of variables merge together into a single Procrustean cluster. Because the characteristics used to define our 21 subsystems in space and time were stratification variables, it is possible to infer that the main patterns discovered in Richardson's war data are unrelated to the procrusteaness of our original analytical cuts on alliance formation patterns. Instead, wars did not fit our temporal and spatial boundaries very well, contrary to Denton's analysis.

Although the dimensions of Richardson's data resemble those of Wright's, the two sources fail to overlap insofar as Richardson's data, even when expanded by the Bendix and Fornander sources, do not pertain to subsystems I-V or XI; Wright's coverage is complete for all but Hawaiian subsystems. A smallest space analysis of the stratification and Wright variables, some 50 in all, promises to unravel any artifacts in the results due to sampling problems. The most prominent feature of the second smallest space analysis³² is a wider amount of scatter among

³² A factors analysis of the 33 stratification and 17 Wright variables once again produced results that were unsatisfactory in technical respects— inflated communalities, failure of an oblique solution to improve simple structure from an orthogonal solution. A principal axis factor analysis was first

the points (Table 5 and Figure 2), but the overall goodness of fit of the two-dimensional solution is almost identical with the Richardson data. The four main war dimensions are found at the extreme right, whereas stratification clusters once again enjoy a much wider ambit. Some stratification variables, hence, are more related to war than others.

The costs and benefits of various types of polarities resemble those found with the Richardson data. *Unipolarity* is considerably isolated from the independent variables in the northwest portion of the figure; the only war variables nearby are extraregional war indices. Members of unipolar systems, in other words, tend to fight outside the region rather than inside, as had been discovered in Figure 1. *Bipolarity*, although once again planted squarely in the middle of the configuration, occupies a point surrounded largely by independent variables, and it is least distant from variables indexing wars with many belligerents. *Tripolarity* is the same distance from the War Multilaterality factor as bipolarity but closer to variables measuring the length and numbers of wars. *Multipolarity*, finally, is adjacent to the Extra-Era wars and somewhat closer to the War Incidence dimension than bipolarity. Unlike Richardson's data, most of the Wright war variables are closer to the polarity codings than to the alliance data. Because of the restrictive sampling criteria employed by Wright, and the consequent overweighting of wars involving major powers, perhaps we should not be surprised to find some of these slight differences from the more inclusive Richardson data.

Some alliance and stratification factors, nevertheless, are highly related to Wright's war data. Size, Multipolarity, and Differentiation box in most of the war dimensions. Subsystem Size is fixed intimately vis-à-vis War Incidence and touches Multilaterality; Extra-Era and Extra-Region variables are near also, but multipolarity is closest to the Extra-Era cluster. Presence of middle powers and absence of neutrals, the two variables loading highest on the Differentiation factor, are most predictive of War In-

cidence; the two points are at opposite ends of the plot by dint of the negative loading of one of the two variables on the Differentiation dimension. Consistent with the Richardson findings, the Size dimension is unquestionably related to the War Incidence and Multilateral factors. Larger subsystems are somewhat more distant from extrasystem wars in the Wright data, undoubtedly because the latter source lists fewer colonial conflicts than Richardson. The propinquity between War Incidence and Differentiation, however, is a new finding entirely. For Wright the presence of a substantial number of middle powers and a lack of extrasystem alliances entails more wars; in Richardson's data the Differentiation variables are stationed closer to War Incidence.

Although findings in the two smallest space analyses converge in general, some incongruities do becloud generalizability. A pooling of all 68 variables seems necessary in order to determine whether the dimensions of Richardson's and Wright's data are so disparate as to warrant a more complex interpretation of results. Alternatively, we did observe considerable resemblance in the variables loading on factors extracted from the preliminary screenings of the 19 and 17 variables, so a combined analysis would seem to hold the prospect for merger of the dependent variable dimensions and hence a more simplified pattern would emerge vis-à-vis the stratification variables.

To replicate the smallest space analysis findings, a *cluster analysis* is performed.³³ The advantage of cluster analysis is that one can decompose a set of variables on a binary basis, such that the most similar pairs of variables are first grouped together and then additional clusters are added to the original atomic dyads in a tree-like fashion. Our four variables pertaining to types of power stratification were coded as 0 or 1, so we are assured that in a cluster analysis four main clusters appropriate to polarity would remain distinct until the very end; we are thus able to determine precisely which alliance and war variables have the greatest affinity for the four types of power distributions. There is another convenient feature of the cluster analysis procedure. Data from Richardson and Wright were collected so as to parallel each other: for each source, we have figures for number of wars, number of major power wars, and so on down the list. If the data are greatly different in some systematic or random manner, for example, then

attempted with 1.0 in the diagonal, nine factors emerging with eigenvalues exceeding 1.0 and a negative root was encountered on the tenth cycle. The varimax findings, however, were somewhat sharper: (1) Multipolarity and Size collapse alone with War Incidence on the first factor; (2) Size and Multilaterality, on factor II; (3) War Incidence and Differentiation load high on factor III, but are inversely related. None of the remaining factors recombine any of the dimensions discovered in the preliminary analysis.

³³Smallest space analysis was precluded because of the 50-variable limit. The data input to the cluster analysis was the 68 × 68 Pearsonian correlation matrix.

FIGURE 2. Smallest Space Analysis of Wright and Stratification Data*

* For key to variable numbers, see Tables 1 and 3. Upper case Roman numbers denote oblique factors from Table 4; lower case Roman numbers, oblique factors from Table 2.

we would expect that variable 34 (Richardson: number of wars) would not emerge on an early cluster with variable 53 (Wright: number of wars), and so forth for the remaining variables. Cluster analysis supplies a precise measure, the coefficient of similarity, for the extent to which any one variable resembles another, thus permitting us to assess which Richardson and Wright variables are most similar or dissimilar.

In examining the results, we find first of all that separate unipolar, bipolar, tripolar, and multipolar clusters do indeed emerge (Figures 3-6). Unipolarity eventually merges with bipolarity, and the tripolar and multipolar clusters are combined, but only after all other variables have been located on one of the four clusters.³⁴

³⁴ The four main clusters converge as follows: the unipolar and bipolar clusters merge at

Secondly, most of the variables assembled from the Richardson and Wright compilations emerge either on initial dyadic clusters or appear within second-order clusters, so the two sources are fundamentally homogeneous. And, thirdly, the initial dimensions—seven to nine for stratification variables, six and five respectively for the Richardson and Wright sources—are clearly discernible, the war dimensions collapsing into stratification dimensions as anticipated above.³⁵

—92.5356; the tripolar and multipolar clusters collapse at —102.5750; and the entire set of 68 variables come together at a similarity coefficient of —119.9040.

³⁵ A principal axis factor analysis on the 68 × 68 Pearsonian correlation matrix extracted seven factors, with a negative root encountered on the eighth cycle. The orthogonal (varimax) loadings

FIGURE 3. Unipolarity Cluster

There are two subclusters within the cluster containing *unipolarity* (Figure 3). Associated most closely with the existence of a single power center is a tendency for extraregional alliances to be contracted between major and minor powers; a large number of sovereign states enter the subcluster next, followed by an availability of resources-extraregional alliances dyadic cluster. The Imperial Decline and Expansion dimensions are thus located here. Extra-Era and Extraregional wars, factor V for both Richardson and

Wright, constitute the second subcluster, and the fact that they merge with the first subcluster at such a high similarity coefficient level indicates that the two subclusters are relatively homogeneous. Unipolar international subsystems, hence, are likely to be rather dull and pacific arenas: major and even minor powers are likely to contract alliances and to make wars in other locales, though a lack of internal alliances is more intimately a facet of unipolarity than absence of wars. Results are more complex in the *bipolarity* cluster (Figure 4). Bipolar systems evidently nurture exclusive alliances among major powers, involve many minor powers in alliances with major powers, and the scope of these alliances extends beyond the analytical confines of a particular subsystem region. These were the variables loading on the Blocs dimension in the preliminary factor analysis. The next subcluster is composed of Destabilization variables: bipolar wars are very likely to be long and will result in destabilization. The larger subsystems have been bipolar, we find this time, for the third subcluster contains magnitudes in subsystem members (major, middle, minor, and satellite powers) and in alliances of all types. From the magnitude of the similarity coefficients it appears that bipolarity is more responsible for lengthy, destabilizing wars than for subsystem size. Less well connected, but more related to bipolarity than to other power distributions, is a tendency for strong regulators, multilateral alliances, multi-major alliances, and a preference on the part of major powers

were input to a quartimin oblique rotation, which ran 30 cycles, 28500 iterations, a biqurtimin solution having turned up an unacceptable abundance of inflated factor loadings. The findings are similar to those derived from the cluster analysis: (1) Multipolarity and Size collapsed along with War Incidence on factor I; (2) Procrusteaness and subsystem Size are related to Extrasystem Wars; (3) Size is linked to Multilateral Wars; (4) Alliance Saturation and Extra-Era War dimensions are found together; (5) Alliance Saturation is related to Duration and Destabilization on two factors, one for Richardson and the other for Wright. The meaning of the seventh factor is not clear. These results are not presented here because they reinforce previous findings and, thus, would be redundant information; yet another reason, however, is that the polarity codings, our main interest herein, receive no significant loadings. Cluster analysis does not bury the relationships one seeks to discover and is therefore discussed in more detail.

FIGURE 4. Bipolarity Cluster

for alliances only with one another; few isolates are observed within the dense alliance network. Alliance Saturation merges with bipolarity only when the Destabilization and Size dimensions are bound up with bipolarity: Alliance Saturation, thus, is related to destabilizing and lengthy wars in larger subsystems. *Tripolar* subsystems are distinguished by their tightness (lack of neutral powers) and as well for an absence of middle powers (Figure 5). Because some of the tripolar systems are Hawaiian, and hence not reflected in Wright's data, there is some ambiguity and lack of close association between the initial subcluster and the other subclusters sketched in Figure 5. The second cluster contains both Richardson and Wright variables pertaining to the Extra-Era dimensions, but the third subcluster seems only very remotely a part of the total cluster. Since tripolarity joins multipolarity soon after the formation of the third subcluster in Figure 5, we may interpret the variables in the final tripolar subcluster, which come from War Multilaterality dimensions, as reflecting a general pattern common to any subsystem with more than two main poles: nearly every country is at-war, wars tend to be general rather than localized in terms of number of participants, and many soldiers die during these

eras. These findings negate the image of multipolarity as freer from dramatic crises, for the outcome of general wars is much more likely to lead to system transformations than the results of localized conflicts involving the use of force. The initial subclusters within the unipolarity, bipolarity, and tripolarity clusters are similar insofar as variables extracted from Richardson and Wright are not present; war data form distinct subclusters, which later merge with the polarity variables. Such is not the case with *multipolarity* (Figure 6), which is apparently wedded to the appearance of new wars within many years of a subsystem era. The two other subclusters, similarly, contain variables referring to a large number of total wars and warlike states, whether measured in magnitudes or normed by dividing raw figures in such a way as to render the quotients more comparable from one subsystem to the next. The War Incidence dimension, in short, is associated uniquely with multipolarity and with no other stratification variable.

VI. DISCUSSION

Results from the above tests of the relationship between power stratification and international stability challenge much of the existing

FIGURE 5. Tripolarity Cluster

folklore within current system theory in international relations. First of all, the number of poles in a system predicts somewhat less well the amount of violence than do other stratification

elements, such as alliance configurations. Secondly, classical balance of power theory, with its faith in so-called inherently benign operations within multipolar systems, is undermined.

FIGURE 6. Multipolarity Cluster

Thirdly, procrustean alliance patterns are related only to extrasystem wars, so our analytical cuts do not interfere with the generalizability of our findings. Fourthly, results are substantially the same for two distinct data bases: our findings are independent of criteria for determining membership in subsystems.

Unipolar systems are clearly the most pacific; most members prefer to engage in war outside the system if at all. But of course a hierarchical unipolarity in which one state dominates many others is largely an extinct phenomenon historically. *Bipolarity* is associated consistently with longer wars, and countries seeking to upset an existing distribution of resources are most successful in bipolar systems. Rosecrance's hypothesis that bipolar struggles have a definite impact in terms of stabilization or destabilization is hence supported. Consistent with Waltz, major powers in bipolar systems must be content to accept infrequent, localized yet prolonged wars as concomitants of an intense rivalry that erupts in nibbling at the few ambiguous peripheries of super-bloc domains. Tripolarity and multipolarity are more difficult to separate from each other in terms of systemic costs and benefits. They contain the highest rates of war, incidence of war casualties, and most countries in such systems dispatch troops to battlefields. Multilaterality is assigned most frequently to *tripolarity*, and war incidence adheres to *multipolarity*. This finding is consistent with Rosecrance's characterization of multipolarity as most likely to harbor conflict with ambiguous outcomes but negates the Deutsch-Singer formulation.

The choice between bipolar versus multipolar arrangements now seems clear. If a state or group of states is willing to accept long wars that are won by aggressor states, bipolarity provides an escape from the more war-prone, character of historical multipolar subsystems. Multipolarity entails more violence, more countries at war, and more casualties; bipolarity brings fewer but longer wars.

VII. CONCLUSION

Several conditions bound the generalizability of the findings presented herein. Although most of the current theorizing on international system dynamics is based upon European cases, and the present study makes an effort to encompass a wider sample, with only 21 cases of high levels of statistical significance, and a satisfactory representativeness of all possible subsystems cannot be claimed. Missing data, furthermore, undoubtedly precluded consistent findings among the various multivariate techniques applied. But the need to operationalize more of the variables

deemed salient by Rosecrance and Waltz is the most glaring task remaining in order to achieve a richer body of tested propositions, particularly since the key independent variable—polarity—is less precisely measured than the most significant dependent variables.

With such caveats in mind, one might expand the main finding of a negative relation between system stability and number of power centers to congruent situations. Within a domestic political system, for example, it does not seem surprising to expect that strong centralized rule guarantees domestic stability much more than the presence of sectionalism or separatist groups. Supranational integration and national unification, similarly, are achieved more peacefully and effectively if engineered by single strong core states rather than by rival states or achieved in an egalitarian manner.³⁶ The tyrannical aspects of consolidated rule in monoelite systems, however desirable for limiting levels of violence, are not easily mitigated through institutional channels and by formal regulators, however. We are therefore confronted with a Hobson's choice between the pacific virtues of strong authority and the prospect of the evils of license in political systems, whether intranational or international, which permit more liberty to their constituent parts.

DEFINITIONAL APPENDIX

1. *Number of poles*. Sum of significant military power centers, such as unaligned major powers, rival blocs or alliances. (Rosecrance)
2. *Unipolarity*. A subsystem containing one pole with a plurality in military powers without significant opposition.
3. *Bipolarity*. A subsystem with two main military power centers.
4. *Tripolarity*. A subsystem with three main military power centers.
5. *Multipolarity*. A subsystem with four or more military power centers, usually unaligned major powers.
6. *Availability of resources*. The presence of neutral powers, that is, entities not aligned with the main poles; or, the existence of areas ripe for military expansion in view of their unguarded, power-vacuum status (antonym: unavailability). (Rosecrance)
7. *Tightness of poles*. Lack of neutral powers mediating significantly between poles (antonym: looseness). (Kaplan)
8. *Strength of regulator*. Systemic institutional device or practice with an ability to check aggression from one or more poles, such as balance of

³⁶ Amitai Etzioni, *Political Unification* (New York: Holt, Rinehart, Winston, 1965).

- power, alliance system, concert of major powers, intergovernmental organization. (Rosecrance)
9. *Number of members*. Sum of entities with military viability that interact more or less continuously within a region in a manner relevant to political-military goal attainment, adaptation, pattern maintenance, and integration.
 10. *Number of major powers*. Sum of members that can be totally defeated in battle by no other single power, but instead by a combination of members (usually including another major power).
 11. *Number of major and middle powers*. Sum of major powers plus members that can be defeated militarily only by single major powers. (NB. A *minor power* is the residual category for the weakest entity of a subsystem.)
 12. *Number of satellites*. Sum of members that remain internally autonomous but have foreign policy decisions made by an outside power.
 13. *Fully sovereign members/members*. Percentage of members retaining sovereign status throughout an entire subsystem era, excluding satellite states and (either abortive or successful) subnational entities in revolt.
 14. *Members/middle and major powers*. See definitions 9 and 11.
 15. *Major powers/major and middle powers*. See definitions 9 and 11.
 16. *Number of alliances*. Sum of nonaggression pacts, defensive pacts, and ententes between entities. (Singer and Small)
 17. *Aligned countries/members*. Percentage of sovereign members of a subsystem entering at least one alliance ("sovereign" at least for one year in the era).
 18. *Alliance partners/alliances*. Mean number of countries in all alliances of a subsystem.
 19. *Alliance partners/alliances/members*. See definitions 17, 18.
 20. *Number of alliances between major and minor powers*. Sum of alliances with major powers and minor powers as members.
 21. *Minor powers allied to major powers/minor powers*. Percentage of minor powers allied with at least one major power.
 22. *Partners in alliances including minor and major powers/all such alliances/minor powers*. Mean number of members in alliances with at least one major and one minor power.
 23. *Partners in alliances including both minor and major powers/all such alliances/minor powers*. See definitions 11 and 22.
 24. *Number of alliances exclusively between major powers*. Sum of alliances contracted between major powers lacking either middle or minor powers as partners.
 25. *Alliances exclusively between major powers/alliances including major powers*. Percentage of alliances containing at least one major power that have neither middle nor minor powers as partners.
 26. *Partners in exclusive major power alliances/all such alliances*. Mean number of members in alliances lacking middle or minor powers as partners.
 27. *Partners in exclusive major power alliances/all such alliances/major powers*. See definitions 10 and 26.
 28. *Alliances starting in earlier era or ending in later era/alliances*. Percentage of alliances either contracted in a previous subsystem era or terminating in a later subsystem era.
 29. *Alliances including both major and minor powers starting in earlier era or ending in later era/alliances including major and minor powers*. See definitions 10, 11, 20, 28.
 30. *Alliances exclusively between major powers starting in earlier era or ending in later era/alliances including major and minor powers*. See definitions 10, 24, 28.
 31. *Extraregion alliances/all alliances*. Percentage of alliances contracted between at least one member of a subsystem region and at least one nonmember of that subsystem region.
 32. *Extraregion alliances including major powers/all alliances*. See definitions 10, 20, 31.
 33. *Extraregion alliances including minor powers/all alliances including minor powers*. See definitions 11, 24, 31.
 34. *Number of wars*. Sum of fatal quarrels involving more than the loss of 314 lives. (Richardson)
 35. *Members at war/members*. Percentage of members fighting in at least one war.
 36. *Participants in wars/members at war*. Sum of all belligerent participants in all wars divided by the sum of members fighting at least one war.
 37. *Participants in wars/wars*. Mean number of members fighting per war.
 38. *Durations of wars/wars*. Mean number of years per war (rounded up).
 39. *Years with new wars/years in era*. Percentage of years in a subsystem era containing an outbreak of at least one new war.
 40. *Number of wars with major powers*. See definitions 10, 34.
 41. *Wars with major powers/major powers*. See definitions 10, 35.
 42. *Participants in wars with major powers/all such wars*. See definitions 10, 37.
 43. *Durations of wars with major powers/all such wars*. See definitions 10, 38.
 44. *Years with new wars with major powers/years in era*. See definitions 10, 39.
 45. *Wars resulting in destabilization/wars*. Percent-

- age of wars won by members resulting in a change in ante bellum conditions, such as redrawing of boundaries or transfer of sovereign control over a population, favoring the aggressor.
46. *Wars with major powers resulting in destabilization/wars with major powers.* See definitions 10, 45.
47. *War deaths/wars.* Mean battle-related casualties for all wars fought in subsystem era.
48. *Wars starting in earlier era or ending in later era/wars.* See definitions 28, 34.
49. *Wars with major powers starting in earlier era or ending in later era/wars with major powers in era.* See definitions 10, 29, 34.
50. *Extraregion wars/all wars.* See definitions 31, 34.
51. *Extraregion wars with major powers/all wars with major powers.* See definitions 10, 32, 34.
52. *Level of disturbance.* Extent of international conflict challenging responses by the regulator to preserve an existing power distribution (Rosecrance).
53. *Number of wars.* Sum of instances of military combat between states involving formal declarations of war. (Wright)

DIRECT LEGISLATION: SOME IMPLICATIONS OF OPEN HOUSING REFERENDA

HOWARD D. HAMILTON*
Bowling Green State University

Any middle-aged member of the political science guild in a retrospective mood might ponder a question: "What ever happened to direct democracy?" In our halcyon student days the textbooks discussed the direct democracy trinity—initiative, referendum, and recall—described their mechanics and variations, explained their origin in the Progressive Era, told us that the United States, Australia, and Switzerland were leading practitioners of direct democracy, cited a few eccentric referenda, gave the standard pro and con arguments, and essayed some judgments of the relative merits of direct and representative democracy. Latter day collegians may pass through the portals innocent of the existence of the institutions of direct government. Half of the American government texts never mention the subject; the others allocate a paragraph or a page for a casual mention or a barebones explanation of the mechanics.¹

A similar trend has occurred in the literature. Before 1921, every volume of this Review had items on the referendum, five in one volume. Subsequently there have been only seven articles, all but two prior to World War II.² "The Initiative and Referendum in Graustark" has ceased to be a fashionable dissertation topic, only four in the last thirty years.³ All but two of the published monographs antedate World War II.⁴

The diligent students of voting behavior have

neglected referenda—perhaps one does not plough a field which one presumes already has eroded away. However some sociologists, in quest for indicia of alienation and anomie, have stumbled on to some referenda.⁵ Community power studies have made limited use of referenda data.⁶ A handful of studies have effectively employed referenda data for various purposes. Wilson and Banfield calculated the ethnic and income correlates of bond issue voting as indices of public—and private—regardingness.⁷ Referenda data have been used to diagnose the non-success of urban renewal and metropolitan government schemes.⁸ Survey research has been employed to ascertain voting behavior in four case studies, three of open housing referenda, and a bond election in one community.⁹ Scant effort has been made to use survey methods to illuminate the dynamics of referenda, to ascertain the policy consequences of direct legislation, or to appraise its efficacy as a decision-making instrument.

A casual explanation for the demise of direct democracy without the courtesy of an obituary

might run something like this. In contrast to the opening years of this century when life was simple and democratic feeling ran high, bubbling with naivete and excessive optimism, in the latter half of the century direct democracy is anachronistic for a polity of two hundred million, whose technical policy questions far exceed the ken of everyman and require a minute division of labor and responsibility, with decision-making assigned to elites, legislative and bureaucratic, with specific competencies. Direct democracy has no place in the age of organization. Although no one noticed, it necessarily went out with the horse and buggy, and the Madisons and Burkes who feared the excesses of democracy may rest in peace.

The presumption that direct democracy is of negligible significance seems exaggerated. Every year I am summoned to be a legislator four, six, or eight times, enacting or rejecting property tax levies, bond issues, nonproperty taxes, public works projects, redistricting the legislature, revising school districts, and assorted amendments of city charter and state constitution. In a recent year there were 1,846 referenda in Ohio.¹⁰ Although direct democracy is almost nonexistent in some states, the national volume of referenda may be ten to fifteen thousand annually.¹¹

Are referenda inconsequential despite the volume—merely perfunctory ratification of trivial matters? Indubitably many are trivial, such as minor technical amendments of a state constitution in a familiar contextual syndrome: proposed by a virtually unanimous legislature, sponsored by a few prestigious organizations, and without organized opposition. But other constitutional referenda are important and contested vigorously. The electorate's decisions are hardly trivial when it simultaneously rejects a legislative apportionment tailored for partisan advantage by a governor and his cohorts and their proposal to establish a state bond commission authorized to finance any state or local function (and leave the bills for successors).¹²

¹⁰ Ohio Election Statistics, 1957-58.

¹¹ A national sample of school referenda reports that the sample of 583 districts had 2,630 referenda in the decade, 1948-1959, which produces an annual national average of 13,000 school referenda for that period. Subsequent consolidation of districts has reduced the number but not the significance of school referenda. A. F. Carter and W. G. Savard, *Influence of Voter Turnout on School Bond and Tax Elections* (Office of Education, 1961), p. 10.

¹² The substance and fate of Ohio State Issues One and Two, May, 1967.

Surely school boards and administrators do not view referenda as empty routine. Of six controversies in Chicago which Banfield selected as the most important in a recent period, the referendum was a factor in three; in each instance proponents of plans chose not to risk a referendum.¹³ A legislature generously offers local units an assortment of "permissive taxes," but permission must also be secured from the local electorate, and the new "authority" remains dormant.¹⁴ The presence or absence of the referendum has been crucial in two areas of public policy: fluoridation and open housing.

Not only is direct democracy slighted by the textbooks, but when mentioned the treatment is likely to be misleading. Generally the brief reference is exclusively to state level I and R, which also has been the focus of most of the literature. Although statewide referenda are frequent in a few states, notoriously California and Louisiana, the national average of state referenda is 70 in odd years and 300 in even years, about two per cent of the volume of local referenda.¹⁵ Consistent with grass roots folklore, it is at the local level that direct democracy flourishes and affords abundant opportunities for study.

I. OPEN HOUSING REFERENDA

Between 1963 and 1968, ten cities and the state of California conducted open housing referenda. All were initiated by opponents who utilized the referendum provisions of city charters or state constitutions in an effort to cancel open housing legislation by vote of the sovereign electorate. In some communities the petition drive was a project of John Birch Society activists. The strategy of nullifying the public policy set by the processes of representative democracy by invoking the machinery of direct democracy worked consistently until 1968. The California statute received only 35% support from the electorate, city ordinances from 25% to 47%. Indeed, until the surprising victory of the Flint ordinance in February, 1968, by a paper-thin margin on a recount, it appeared that open occupancy could never win at the polls.

The voting patterns have been investigated for three of them. The California "Proposition 14" in 1964 and the previous one in Berkeley

¹³ Edward C. Banfield, *Political Influence* (New York, 1961).

¹⁴ Local officialdom is not grateful for the "permissive taxes" recently authorized by the Ohio General Assembly.

¹⁵ Tabulated by Hugh A. Bone, "Easier to Change," *National Civic Review*, 57 (1968), 120.

were analyzed by matching census data with vote tallies by wards and secondary analysis of limited data from a commercial poll.¹⁶ The Toledo referendum, September, 1967, was examined by a city-wide sample of 456 (usable) interviews conducted during the week preceding the referendum and interviews of protagonists.¹⁷

The Toledo survey explored dynamics of voting behavior in referenda. Some of the specific objectives were to measure the degree of interest and involvement among categories of the electorate; to ascertain the electorate's sources of information, advice, and influence; to measure the volume of communication and the voter's evaluation of information sources; to determine the effect of the contemporaneous riots and the amount of "white backlash"; to compare the non-voters with the minority which voted; and to correlate voting with attitudes and socio-economic variables.

The studies of the Berkeley and California referenda focus on voting correlates and description of the struggle. Here our concern is comparison of voting behavior in referenda and national elections and the implications of the open housing referenda for the theory of direct legislation, particularly its efficacy as a decision making process. The focus can be indicated by a few hypotheses: (1) Campaigns in open housing referenda are unlikely to result in much conversion, because we know that presidential campaigns principally reinforce beliefs and activate predispositions; in an open housing vote racial attitudes substitute for party identification as potent predispositions. (2) The existence of such strong predispositions will make ineffective the efforts of community elites to influence the outcome. (3) For the same reason recent riots will have little impact on the outcome. (4) The paramount determinant of turnout in referenda is the significance of the concurrent election (if any) rather than the significance of the issue because of the low salience of local politics. (5)

For that reason and because most referenda are nonpartisan, turnout at local referenda usually will be low, a contradiction of a foundation premise of direct democracy. (6) The rationale of direct legislation as pure democracy also is clouded by the likelihood that those who do vote are somewhat unrepresentative of the populace. Some unrepresentativeness is almost a certainty, because we know that elections normally have some class and racial bias. That factor is likely to make the referendum figures an inaccurate, and possibly even erroneous, reading of public opinion in the jurisdiction. (7) Therefore the accuracy of referenda as measures of opinion for a jurisdiction is maximal when referenda are scheduled concurrently with presidential elections, and have the greatest potential for distortion or miscarriage when scheduled alone or concurrently with an insignificant election. (8) Because of the low salience of politics, the efforts of referenda protagonists to communicate with the electorate in any large jurisdiction will not reach a substantial portion of the populace, even on such extraordinary issues as open housing. (9) Therefore the information level regarding the issue will be rather low for a large portion of the population of any large jurisdiction (and often in small ones), which is inconsistent with the civic man premise of direct democracy and militates against the efficacy of the referendum as a public policy decisional process. (10) But the actual voters in referenda will have distinctly more knowledge than non-voters, as per our knowledge of voters and nonvoters, which improves the rationality of decision making by referendum at the cost of violating its own ethic of universality and augmenting the bias. (11) In a referendum numerous voters actually do not fulfill the legislative role of seeking and weighing all the pertinent data and considerations in a diligent search for the public interest, but instead vote their private preferences.

II. INTEREST, STAKE, AND PARTICIPATION

Voting research has demonstrated that electoral participation is a function of an individual's psychological involvement in politics and has documented abundantly the slight interest of most people in politics.¹⁸ The turnout rates of local elections indicate that psychological involvement usually is less in local than national politics. Although voting rates for local referenda fluctuate considerably, turnout is rarely high and occasionally below 10%.¹⁹ This contra-

¹⁶ T. W. Casstevens, *California's Rumford Act and Proposition 14 and the Defeat of Berkeley's Fair Housing Ordinance*, pamphlets published by Institute of Governmental Studies, Univ. of Calif.; Raymond E. Wolfinger and Fred I. Greenstein, "The Repeal of Fair Housing in California: An Analysis of Referendum Voting," this REVIEW, 62 (1968), 753-769.

¹⁷ Two hundred eight clusters of three housing units were drawn systematically. A randomizing device was used to spot the cluster within each block and another to select the interviewee. Interviews were completed in all but one cluster, two in most, with a completion rate of 76%, exclusive of vacancies and razed areas.

¹⁸ Angus Campbell et al, *The American Voter* (New York, 1960), pp. 89-115.

¹⁹ School fiscal issues comprise about three-fourths of all referenda. The mean turnout at

diction of grass roots mythology is clarified by recent investigations of the determinants of voter psychological involvement. It is diminished for referenda by the lower visibility of the objects of local than national politics and by the absence of partisanship. Intensity of party preference is the strongest index of voting in national elections.²⁰ The nonpartisanship of most referenda affects turnout doubly by removing both the strongest internal stimulus and the external stimulus of party organizations. Also referenda may impose additional burdens on the voter by being scheduled as "special elections" or by their abstruseness.

Open housing might be that rare specimen, a referendum which generates psychological involvement equal to or possibly in excess of presidential elections. The issue does not appear complex or remote to most people, intensive campaigns are waged, candidates and parties take positions, and the referendum poses starkly what is perhaps the most fundamental and emotionally charged issue of domestic policy today. The 1964 California referendum appears to support that hypothesis; the turnout was 85% of the registered voters, distinctly higher than other referenda on the ballot, and only 2% below the presidential vote. However the Toledo referendum, a better test because of its separation from a presidential election, furnishes evidence to the contrary.

The paramount determinant of turnout for a referendum is scheduling—the significance of the concurrent election. Open housing indubitably generates more involvement than local politics

school fiscal referenda was 36.3% of eligible voters in the 1948–1959 period. Carter and Savard, *op. cit.*, 12. Turnout rates on four fiscal referenda in upstate New York towns ranged from 7% to 45%. R. V. Presthus, *Men at the Top* (New York, 1964), 259–261.

normally. It established a city primary turnout record in Toledo, but 64% of the adult population did not go to the polls and 8% of those voting passed up the proposition. Furthermore, the turnout at the subsequent (nonpartisan) city election sans the housing issue was higher (44%), and much higher at the 1968 presidential election (80%).

The relative inability of referenda to move people to the polls is underscored by comparing the professed level of interest in the Toledo referendum with an SRC national sample's interest in presidential elections. Employing the same yardstick, the professed interest level of the Toledo sample was higher. Here is a pronounced contrast of electoral behavior in national elections and local referenda: corresponding levels of professed interest may not produce comparable voting rates.

Interest and other dimensions of psychological involvement, such as political efficacy, do exert comparable effects on individual decisions to vote or abstain in local referenda and national elections. The pattern of association is the same in both types of elections (Table 2), but the starting plateau is much higher for presidential elections, which attract even a majority of the persons at the bottom of the interest and political efficacy scales. Local referenda, even on open housing, do not approach the magnetism of presidential elections.

The Toledo housing referendum was no exception to the proposition that politics are not salient for the populace. The controversy was rather an

	Whites	Negroes	Total
Great deal	14%	25%	16%
Slightly	26	17	24
None	50	44	48
Don't know	10	13	11

academic matter for many respondents; only 40% perceived its outcome as affecting them personally, and only 16% felt a great personal stake in it. More of the Negroes perceived a personal stake, but less than half thought the outcome would affect them personally. One reason for the apathy of Negroes was pessimism. "A lot of Negroes feel it won't pass, and will have little effect if passed."

The Toledo referendum also adhered to another pattern of electoral behavior: lower participation by Negroes. That issue might be expected to produce an exception to the pattern, but it did not. The election day impression was confirmed by an examination of election records which disclosed that 37% of the whites in the sample actually voted but only 28% of the Negroes. Here again the principal determinant is the significance of the concurrent election. There likely was less Negro voting gap in the California referendum concurrent with a presidential election which drew 85% of the registered voters to the polls.²¹

²¹ The Berkeley turnout of registered voters was slightly higher in census tracts with over half Negro residents than in other tracts, but the data furnish no measure of how many Negroes were unregistered. T. W. Cassstevens, *op cit.*, 87. Most Negroes were not registered for the Toledo referendum.

Applying the sample voting ratios to (amazingly accurate) population estimates enables one to estimate the number of Negro and white Voters in the Toledo referendum and to ascertain the responses to the issue by white Voters. Approximately 9,000 votes were cast for open housing by Negroes and 14,000 by whites. It follows that only one-fifth of the white Voters supported the ordinance; the pattern of white voting was 20% for, 70% against, and 10% abstention.

III. THE NONVOTERS

Low participation rates not only are at variance with the premise of direct democracy that the people wish to be legislators, but also vitiates somewhat its claim to be a more authentic expression of the "general will" than the representative body whose decision is being challenged. Therefore, how representative of the views of the populace was the active minority, one-third of Toledo adults, that made the open housing decision? The vote could be unrepresentative in either direction depending upon which side achieved the greater mobilization. The larger volume of nonvoting shows that mobilization was quite incomplete on both sides, but all the data indicate that mobilization of the potential pro vote was less effective.

Table 5 indicates that the nonvoters, as an aggregate, were distinctly more favorable to open housing than the voters. A greater portion of nonvoters was pro and a smaller portion was hostile, in part because Negroes were a larger fraction of the nonvoters than of the voters. The data indicate that among whites opposition was a more intense motivation to get to the polls than a mildly favorable view of the ordinance. The "antis" voted, which corresponds to the findings of some studies of fluoridation referenda²² and to our folklore that voting "agin" is a stronger incentive than voting for.

The unrepresentativeness of the social compo-

sition of legislatures is manifest; as Long says, an election is an oligarchical device.²³ Comparison of the voters and nonvoters confirms that direct democracy also has distinct social bias. Because of low turnouts, local referenda are likely to have more class bias than major elections.

In this instance the unrepresentativeness of the effective electorate produced only a distorted reading of public opinion rather than a miscarriage; but referenda have such a potential when the outcome is close and turnout is low. Those conditions appear mutually exclusive to some extent; the closer the outcome, the less nonvoting should occur. These data do not deny such a relationship, but the significance of the concurrent election is a more potent determinant of turnout. It follows that the miscarriage potential of referenda is maximal when scheduled alone or with an insignificant election and minimal when concurrent with a presidential election.

IV. EFFECTS OF THE CAMPAIGNS

What are the effects of the heated, intensive campaigns in open housing referenda? Do they merely neutralize each other, is there any substantial amount of conversion, or is voting a reflex of preexisting attitudes? For presidential elections, the Erie County and subsequent surveys have provided some of the most solid propositions of voting behavior. Presidential campaigns reinforce beliefs and loyalties, active pre-

dispositions, and convert some people; there is much reinforcement and activation but very little conversion.²⁴ A leader of the Right to Sell Committee agreed that its campaign activated rather than converted, but leaders of the Fair Housing committee believed that their campaign achieved quite a bit of conversion. Our interviews confirmed that there was some conversion, but the following data suggest that the volume was modest.

At least half of the voters in the sample had made up their minds before the campaign began. A fourth said they were undecided, but some merely did not wish to reveal their positions. Only a quarter felt they had been influenced by the campaign, which allowed small room for conversion. Eighty-eight respondents indicated the direction of the influence. The limited evidence indicates that the pro-FHO campaign achieved some net gain among the populace, but mostly among non-voters. Among the voters the anti-FHO campaign's activation effort apparently offset any pro-FHO conversions.

The data indicate that most of the voters had made their decisions prior to the campaign, only a fourth were influenced by it, there was little conversion, and hence the principal effects were reinforcement and activation. These inferences are corroborated by the Berkeley and California case studies. In California an upsurge of support for Proposition 14 occurred during the last weeks of the campaign. Wolfinger and Greenstein's analysis shows that it was a matter of increased understanding of the ballot situation, i.e., that yes was a no vote on open housing. The campaign "had the consequence of making clear

²⁴ Paul Lazarsfeld et al, *The People's Choice* (New York, 1944), chs. 8-10.

to voters how to express their attitudes. It did not lead them to change their attitudes."²⁵ In the Berkeley campaign "the major effect was to activate and rationalize the predispositions of the voters."²⁶

The SRC staff's field theory explanation of those effects in presidential elections is appropriate here. In opening housing referenda also "the psychological forces guiding behavior arise before the campaign opens" and three-fourths of the electorate have made their decisions beforehand.²⁷ The forces that generate the strong predispositions of voters in presidential elections usually are much weaker or absent in referenda, although party identification was significant in the Berkeley and California ones, but for an open housing referendum racial attitudes furnish a functional equivalent of even greater potency. Referenda on other policies may afford more scope for campaign impact on outcomes.

V. EFFECTS OF RIOTS

If campaigns have slight effect on outcomes of open housing referenda aside from clarification of the ballot, what about "white backlash" from riots? The 1967 riots in neighboring Detroit and elsewhere coincided with the Toledo referendum. One might surmise that the riots were influential, because the yes vote in Toledo was only 30% compared to 34.6% in California and below that

²⁵ Wolfinger and Greenstein, *op. cit.*, 758.

²⁶ Casstevens, *op. cit.*, 79.

²⁷ Campbell et al, *op. cit.*, 76.

of all but one of the other cities. However, the lower Toledo vote might be a function of differences in the scope of the various propositions and/or differences in turnout rates. The latter furnish a *prima facie* explanation in light of the differences in the attitudes of the voters and non-voters. Table 5 indicates that had the Toledo decision coincided with a presidential election the yes vote would have been 34.5%. It follows that backlash from the riots could have changed a substantial number of votes only if the Toledo populace prior to the riots was distinctly more sympathetic to open housing than the populace of California. I am unaware of any evidence to sustain that implausible assumption; these data indicate that the riots did not change many votes.

The riots did affect the thinking of several respondents and it was decisive for a few, but the riot impact was not unidirectional. A fourth of the respondents said the riots had influenced them negatively, but a sixth was influenced positively, reasoning that the riots were evidence of the need for open housing.

The responses to the attitudinal items of Table 9 are not indicative of strong white backlash. A large portion of the public attributed the riots to agitators rather than to Negroes collectively. Three-fourths did not anticipate that an open housing law would generate disorder, and only a sixth assented to the proposition that the riots justified denying Negroes "equal housing rights." (The question did not require respondents to equate "equal" and "open" and evidently "separate but equal" remains valid in many minds.) The responses to the public policy question of Table 10 also do not suggest much white backlash sentiment.

VI. PUBLIC INTEREST OR PRIVATE PREFERENCE?

The rationale of direct legislation rests on the populist premises that the plebiscite is the purest form of democracy and that the public interest is the will of the majority of those voting. Critics of direct democracy, perhaps not wishing to appear undemocratic, usually do not challenge the democratic theme, which the foregoing

data indicate is vulnerable, but instead focus their fire on its efficacy as a public policy decisional process, questioning the electorate's capability to legislate wisely because of allegedly inadequate knowledge. Pollock examined this issue by assaying the judgment over time of the Michigan electorate and concluded that it was at least as good as the legislature's.²⁸ However, some recent observations are less sanguine, specifically with respect to open housing referenda,²⁹ and there is no dearth of anecdotes of whimsical incidents, e.g., voting for a new fire department and simultaneously rejecting the implementing tax levy.³⁰

Assaying the record of the electorate's judgments is an extraordinary subjective enterprise, but there may be an alternative approach. Do voters at referenda express their respective judgments of the public interest or their personal preferences? It would seem that when the electorate undertakes to second-guess the legislature it has the same responsibility to search for the public interest. In terms of Simon's efficiency decision-making model, $E_a = O_a/I_a$, a voter is obliged to determine whether the net benefits exceed the costs.³¹ Simon's model is strikingly apropos to fiscal referenda, by far the most numerous species. In a tax levy "election," does the voter ponder in the booth whether the community benefits are commensurate with the cost, or does he weigh his personal benefit against the increment of his property tax?

If voters substitute in Simon's formula their personal values, a plebiscite is logically a sound decisional mechanism only if the majority of private preferences automatically equates with the public interest. That populist premise, also the controverted premise of much interest group literature and some defenses of the rationality of federal budgeting,³² has face validity perhaps for a few referenda, e.g., to legalize colored margarine. Its validity for most referenda is not patent and is demonstrably false for open housing and fiscal issues, because the incidence of costs and benefits is so unevenly distributed. Indeed the disparity is extreme in school referenda, where the paramount beneficiaries are arbitrarily barred from voting and most of the voters incur direct, visible costs and no direct benefits. (Are plebiscites really pure democracy, even sans property qualifications for voting?)

TABLE 10. JUDGMENT OF FHO AS PUBLIC POLICY

"Do you think the F.H. Ordinance would be good or bad for Toledo?"

	Good	Bad	Good & Bad	Little Effect	Don't Know
Sample	44%	26%	1%	4%	25%
Voters	40%	30%	2%	6%	23%
Nonvoters	47%	25%	1%	4%	24%

Open housing is another situation in which the disparity is pronounced; some persons incur benefits and no costs while others perceive themselves as incurring only costs.

To investigate this possibility, the sample was asked, "How do you think the Ordinance would affect the city? Do you think it would be good for or bad for Toledo?" The distribution of the responses (Table 10), even those of the voters is conspicuously contradictory to the results of the referendum. Evidently many ballots were not public policy judgments but expressions of personal preference, that is, not judgments of the public interest but of private interest. (The data below on voter information are consistent with this analysis.) This phenomenon casts some shadow on the efficacy of the referendum as a policy process.

VII. KNOWLEDGE

Unless one holds that the efficacy of the referendum as a policy making process is irrelevant either because the electorate's decision is ipso facto the public interest or "the people are entitled to make their own mistakes" and "deserve the government they get," the allegation of critics that direct democracy overtaxes the information of the electorate merits investigation. The overburdened-uninformed-voter argument is clinched by citation of the referendum volume in a few states (California averages twenty-two per general election³³); hence an isolated referendum is not an acid test of voter knowledge. Indeed the Toledo case presents an optimal situation for electoral knowledge: a single, local ref-

³³ Joseph P. Harris, *California Politics*, 4th ed. (San Francisco, 1967), p. 112. A recent study of voting patterns on California referenda by examination of absentee ballots furnishes data that reflect voter ignorance (only 53% voted on all propositions and the average abstention rate was 15% per proposition) and some confusion. On two antithetical propositions regarding a state lottery, only 47% voted consistently, 45% voted partially or completely contradictorily. John E. Mueller, "Reason and Caprice: Voting on Propositions" (ms, 1968).

erendum on an extraordinarily vital policy, bitterly contested and highly publicized.

Several survey questions solicited knowledge of the issue and the positions of organizations and candidates. Four-fifths of the sample understood the basic nature of the ordinance, but few knew that it had been enacted by unanimous vote of the council. Only a fourth were aware of the existence of the (less comprehensive) Ohio open housing statute; consequently few people had occasion to wonder, "Is the ordinance superfluous?"

A major gambit of the Fair Housing Committee was solicitation of endorsements by community organizations and publication of the list contrasting its forty endorsements with none for the Right to Sell Committee. That publicity preceded and coincided with the dates of the survey; nevertheless half of the sample could name no organizations which supported or opposed the FHO.

Which organizations were the most visible to the electorate? Followup questions regarding the positions of eight major organizations revealed slightly more knowledge than replies to the free answer question. Most people knew or reasoned that the Council of Churches supported it, indicating that the intensive activity of church people was successful to that extent. If people knew anything about the FHO campaign, it was that the churches were for it.

Half of the sample knew or reasoned that the ordinance was supported by the Board of Community Relations (city civil rights agency) and the AFL-CIO Council. The endorsements of the Council and prominent union officials were heavily publicized and the Council's election flyer to unionists carried its endorsed slate on one side and an appeal for the ordinance on the other side. Rarely have union officials taken as

prominent a stand for a cause beyond the scope of union direct interest, but their voices were not heard by half of the citizenry nor by most union members.³⁴

An interesting aspect of Table 11 is that more respondents identified the Democratic Party as for the ordinance than the Republican Party, although the Republican City Committee's endorsement was reported in the press only a few days before the survey, the ordinance was sponsored by the Republican mayor, and the Democratic mayoralty candidate simultaneously was finding defects in the ordinance and obviously courting the votes of opponents. Evidently very few people actually "knew" that the local parties had endorsed FHO and instead more people inferred Democratic Party endorsement from their impressions of the stance on civil rights of the parties nationally. It also is evident that this instance of bipartisanship had scant weight on the outcome.

The results of the primary and referendum were astonishingly incongruent. Only one anti-FHO candidate survived while the mayor and councilmen who had enacted the ordinance won handily. One explanation of the anomalies is that the electorate had an unusual situation: electors could have their cake and eat it too. The survey data furnish another explanation. The electorate did not associate the issue with candidates, because most of the public did not know the positions of the candidates. Three-fourths of the sample could not name a single

³⁴Only 44% of the membership knew of the UAW union's endorsement despite 15 articles in the union organ. Schley R. Lyons, "Labor in City Politics: The Case of the Toledo United Auto Workers," (paper at 1968 meeting of Ohio Association of Political Scientists).

TABLE 11. POSITIONS OF ORGANIZATIONS-RECOGNITION

council candidate pro-FHO and nine-tenths could name no anti-candidate.³⁵ When queried about the stance of the three mayoralty candidates and six Council candidates, the incumbent mayor who vigorously championed FHO was the only one whose position was visible to the public.³⁶

Manifestly most of the public paid little attention to the campaign. In the final week the electorate's knowledge of significant aspects of the issue, of the candidates, and their positions was meager. About all most adults knew was the existence of the referendum, the basic nature of an open housing ordinance, and that the ordinance was supported by churches and the mayor.

Did knowledge advance materially in the last four or five days? Perhaps, but the Erie County study suggests otherwise; at the peak of that presidential campaign "about half of the population ignored stories on the front page of their newspapers and speeches by the candidates" and persons with low exposure in the early part of the campaign continued to have low exposure throughout.³⁷

Referenda require no qualification of two axioms of voting behavior: that "in the electorate as a whole the level of attention to politics is so low that what the public is exposed to must be highly visible—even stark—if it is to have an impact on opinion,"³⁸ and that voters generally are more informed than nonvoters. The knowledge level of voters in the sample was substantially higher than nonvoters on all measures of information, although one could hardly characterize the aggregate voters as well informed, when a majority did not know the positions on the issue of the political parties, the leading newspaper, and most candidates.

The logic of direct democracy predicates higher levels of knowledge than is required for representative democracy; homo politicus is its postulate. The foregoing data and a simultaneous study of Toledo's largest labor union³⁹ surely do not demonstrate that information levels are higher in referenda than other elections.

³⁵ The electorate's ignorance was partially because the strategy of council candidates, except the anti-FHO ones, was to avoid the issue like a plague.

³⁶ There were parallels between the 1964 California election and the Toledo city election. The Republican mayor that championed FHO was defeated by the Democratic challenger who found technical flaws in the ordinance during the primary and campaigned valiantly against crime in the streets.

³⁷ Lazarsfeld et al, *op. cit.*, ch. 14.

³⁸ Campbell et al, *op. cit.*, 60.

³⁹ Lyons, *op. cit.*

The measurements of the Elmira study are too dissimilar for a good comparison, but the knowledge level in Elmira in that presidential election appears at least equal to this referendum.⁴⁰

There are alternative "explanations" of the failure or refusal of many Toledo citizens to become well informed on the open housing issue (that is, to acquire information available in the mass media regarding the positions of organizations and council candidates and the existence of the state open housing law): in moralistic terms as dereliction of civic duty, in psychological terms as selective attention filtering out information, or in economic terms.

Downs' economic logic, that nonvoting and low information are rational behavior because the costs of acquiring information exceed the stakes of the election for most people, would seem less applicable to an open housing referendum whose consequences are more distinct and significant than most elections.⁴¹ There are, however, elements in this situation that fit the economic theory: 60% of the populace did not view the outcome as affecting them personally, the issue had the appearance of simplicity rather than abstruseness, and the voting decision rested more on attitudes than facts; ergo expenditure of effort to acquire information would be uneconomical. If information-seeking was uneconomical here, would it be otherwise for any statewide or many local referenda? If the Downs' theory is a valid explanation of the rationality of inattention and passivity vis-a-vis elections, its implication for the efficacy of direct legislation is not supportive.

VIII. COMMUNICATION

How much communication is generated by a referendum, what fraction of the populace observes references to the issue in mass media and reads handbills, how much is the issue discussed at meetings and informally, and do organization leaders succeed in communicating with the membership? The open housing issue should generate more communication than most referenda, therefore the measurements below perhaps approach the upper limits of citizen involvement in referenda campaigns.

Again benchmarks are missing; there are no closely comparable measurements of communication in referenda or election campaigns. We have some knowledge of aspects of election campaign communication: that exposure is distinctly a function of interest, education, age, and SES; that interested persons have high exposure

⁴⁰ Bernard Berelson et al, *Voting* (Chicago, 1954), ch. 10.

⁴¹ Anthony Downs, *An Economic Theory of Democracy* (New York, 1957), pp. 207-276.

TABLE 12. COMMUNICATION: CONVERSATION

(Pct. vertically)

	DK or NA	2	3	3

to all the mass media and uninterested persons low; that party identification is somewhat associated with choice of media; and that conversation and personal influence remain important, as opinion leaders provide linkage between mass media and the less active segment of the population.⁴²

Open housing should and did generate a lot of conversation but little organized discussion. Approximately three-fifths of the sample and three-fourths of the voters discussed it with relatives and friends; a hyper-active third of the voters discussed it "several times." There was distinctly less talk with neighbors. Half of the voters and 60% of the nonvoters professed not to know the attitudes of neighbors, but three-fourths of those voters who professed to know reported that their neighbors were opposed to the ordinance, which corresponds to the voting and indicates that the attitudes of neighbors are more consequential than the respondents rated their influence (below). The neighbors of nonvoters were less hostile to the ordinance, another indication that the effective electorate on September 12 was not an unselected sample.⁴³

Organizations were channels of communica-

⁴² Lazarsfeld et al, *op. cit.*, chs. 5. 14; Berelson et al, *op. cit.*, ch. 11.

⁴³ Responses to the query about the attitudes of neighbors were:

	DK	50	61

tion and (less) influence, because 40% of the sample, a slight majority of the voters, and a third of the nonvoters belonged to organizations which they knew had endorsed the ordinance. The relevant affiliations were church and union; for this issue, they and the ad hoc campaign committees were the important political organizations of the city. But communication between leaders and membership was incomplete, particularly in the unions. Despite endorsement by prominent union officials and the AFL-CIO Council, only a quarter of the unionists perceived endorsement by their union.

Mass media and the churches were the principal informational sources.⁴⁴ Sixty percent of the sample heard some radio and TV programs or announcements, about 40% observed newspaper advertisements, and a third reported reading news accounts and feature stories. Meetings were an important but less frequent source. Thirteen percent of the sample reported attending meetings where the FHO was on the agenda—principally church groups. (That figure may be an understatement, because few respondents classified church services as "meetings.")

The sharpest aspect of these measurements of communication is the congruence with the Erie County study findings of the distinctly lower involvement of nonvoters.⁴⁵ The voters belonged to more organizations that endorsed FHO, attended more meetings where it was discussed, observed more references in the mass media, and talked about it much more than the nonvoters. However voting does not correlate fully with campaign exposure in a low turnout election; some of the voters were low on exposure and numerous persons who were aware of the FHO campaign did not vote. These data may indicate the ceiling of communication on a public policy issue in a large jurisdiction. Approximately 40% of Toledo adults were oblivious of all the propaganda issued by the Fair Housing and Right to Sell committees, the churches, unions, and anti-FHO candidates for council and mayor.

IX. INFLUENCE OF ELITES AND THE PRESS

Are some sources of information and advice on referenda distinctly persuasive? "On a matter like the Fair Housing question, whose judgment would you respect and place confidence in? Would you be slightly influenced, greatly influenced, or not influenced at all by each of these?" Seven sources were enumerated: newspaper and TV editorials, the comments of friends and neighbors, and recommendations of

"About 30% of the sample reported receiving handbills.

⁴⁴ Lazarsfeld et al, *op. cit.*, 45-49.

the mayor, one's minister, or union. If the respondents were candid, there were no preeminent molders of opinion. There were only two deviations: a fifth of the unionists ascribed great influence to their union⁴⁶ and a fifth of the sample assigned great influence to their minister on this matter. Although respondents possibly underrated, because the forces of influence are subtle and people prefer the self-image of being an independent thinker, their denials of influence are congruent with the overwhelming defeat of the FHO in the face of its endorsement by the press and community elites.

Rarely are the political behaviors of elites and masses so different as in open housing decisions. The contrast was sharper in Toledo, where the elites maintained at least a facade of united endorsement of FHO, than in California where realtors, some taxpayer groups, and two statewide party organizations opposed it,⁴⁷ but the patterns were the same. The elites were more tolerant, other-regarding, and innovative; the masses were more conservative, less tolerant, and more self-regarding. This is consistent with the findings of analyses of referenda in two other policy areas, fluoridation and bond issues.⁴⁸

The open housing plebiscites demonstrate the limitations of elite power. The Toledo story can be stated tersely, the elites were on one side and the votes on the other. The hypothesis of some community power students that elites are so much our decision makers that outcomes of referenda can be predicted by examination of the alignment and activity of elites manifestly does not hold for open housing referenda.⁴⁹ Nor does it hold for other important policy areas: school levies, state and local bond issues, city annexation, and metropolitan government schemes. In school tax levy "elections," elites characteristically are aligned on the pro side but a substantial portion are defeated.⁵⁰ How many "power

⁴⁶ Lyons' survey of the UAW, whose leaders plumped for FHO in the *Union Journal*, reports that although 44% of the membership were aware of the union's endorsement, only 29% favored FHO. But union influence was visible: 60% of Caucasians scoring high on a pro-union political orientation scale favored FHO but only 28% of the Lows favored it. Lyons, *op. cit.*

⁵⁰ In Ohio from 1960 to 1968, 48% of school bond

elite" visions of civic monuments, "growth," and metropolitan government have foundered on the rock of rejection at the polls of "progress" by the intransigent masses? The processes of representative democracy often are more useful for elites and the referendum not infrequently is an insuperable barrier to elite goals.⁵¹

Textbooks inform us that newspapers exert great influence in local referenda,⁵² which may be correct, but is unsupported by the limited amount of research to date. Examining the absentee ballots of the 1964 election in Los Angeles, where the press was generous with advice, Mueller found "little effect on the vote on the propositions" by the newspapers.⁵³ Both Toledo newspapers endorsed the FHO, although the Blade hedged its reputation for influence in local elections by predicting defeat of the ordinance. The Blade editors understood the limitations of elite influence in referenda.⁵⁴

X. CONCLUSION

The variations in the votes of the eleven open housing referenda demonstrate that outcomes are affected by differences in the scope of the laws, in timing, and the nature of communities; but the data of the Berkeley, California, and Toledo referenda indicate that the vigorous

proposals and 25% of school operating levies were defeated. Memorandum of Ohio Education Association.

⁵¹ Typical of mass rejection of civic elite aspirations was the simultaneous rejection by the Lansing electorate of a bond issue for a civic center and an ambitious scheme for incorporating the hinterland township, April, 1953. For an account of the repeated defeats at the polls of elite efforts to establish metropolitan government in Cleveland and St. Louis, see Watson and Romani, *op. cit.*, and Scott Greer, *Governing the Metropolis* (New York, 1962). Greer asserts that the fundamental obstacle to rationalizing the political structures of metropolitan areas is Jacksonian notions of self-determination, exemplified and enforced by the referendum.

⁵³ John C. Mueller, *op. cit.*

⁵⁴ Reo M. Christenson, "The Power of the Press—The Case of the Toledo Blade," *Midwest Journal of Political Science*, 3 (1959), 227–240. The Blade deviated from its characteristic enthusiasm for civil rights, because its editors perceived that the city elites could not win the referendum. Its aloofness, except for a lame last minute endorsement, was a great blow to the FHO proponents and a self-fulfilling prophecy.

campaigns have slight effect on the results. This parallel of presidential campaigns comes from the same source, the electorate's potent predispositions that are activated but rarely changed by a campaign. By extension, the opportunity for conversion in referenda campaigns is a function of the relevance of the issue to any strong predispositions in the electorate.

In Toledo the predispositions rooted in racial attitudes were so strong that the contemporaneous riots had slight effect on the outcome, and the efforts of community elites in a veritable phalanx were unsuccessful. A characteristic aspect of referenda is that some community elites campaign for a measure, often with no visible opposition from others. Their success is likely to relate to the presence or absence of strong predispositions and their congruency with the elite's objective.

The Toledo data display additional parallels to the findings of voting research of presidential elections. Referenda are no exception to the low salience of politics, which is such a communication barrier that in a large jurisdiction protagonists do not reach a substantial portion of the populace. Referenda voting, i.e., the decision to vote, is a function of the same dimensions of psychological involvement, such as interest and political efficacy, and voting has a similar association with class and race. Each of those consistencies has distinct significance for direct democracy theory: for the validity of its universalist ethic and its homo politicus premise, and for its efficacy as a public policy decisional process.

The most conspicuous divergences of the Toledo data are that the turnout plateau was far below that of a presidential election and, although the electorate's professed level of interest was equal to that of presidential campaigns, the turnout was less than half as much. That is not a baffling anomaly; it is the product of the lower salience of local politics and, in this instance and most referenda, the nonpartisanship. Evidently referenda alone, even on critical issues, will not move most people to the polls.

Consequently turnout is less a function of the issue than of the significance of the concurrent election. I have observed this regularity in fiscal referenda and its frequent bearing on outcomes.⁵⁵ From our knowledge of the class and racial bias in voting and the foregoing data on

⁵⁵ The approval rate of school tax levy and bond referenda in Ohio is higher in general elections than in primaries and specials. Thus a school levy is defeated in May and wins in November. Cf. Byron H. Marlowe, "An Explanation of Voter Behavior in Tax Elections" (paper, 1969 meeting, American Educational Research Association).

the differences between voters and nonvoters in the Toledo case, it follows that the accuracy of the referendum as an index of community opinion is maximized when the plebiscite is concurrent with a presidential election and that an isolated one or one concurrent with an insignificant election is likely to be a distorted reading and possibly erroneous if the vote is close and turnout is low.

Direct democracy, whatever its debits, presumably has the august virtue of assuring majority rule. The repeated defeats of open housing enactments in referenda are incontrovertible evidence that representative democracy produces occasional instances of authentic minority rule. One wonders how many instances would be exposed if the I & R were more widespread. However, direct government itself is governance by a minority, only 22% of the population in the Toledo referendum, and that active minority may be far from a mirror image of the populace; mathematically there is room for minority rule in a low vote plebiscite.

There is a defense for any incongruence of the legal electorate and the actual electorate in a referendum. One might say that it is an automatic adjustment for intensity of policy preferences, a solution of "the intensity problem."⁵⁶ The equality of the ballots ignores intensity and therefore might fail to optimize social utility, so fluctuating turnout provides the adjustment for intensity. Can it be said that turnout operated to maximize social utility in the Toledo referendum when Negro voting was below white because of pessimism, poverty, and status? In view of the class and racial bias of voting, can one expect low turnout to be a corrective for the intensity problem? In fact Wolfinger and Greenstein cite this as a principal defect of plebiscitary decision making. Legislators are responsive to intensity, but voters are less disposed or able to make such calculations and every voter's preference is weighted equally.⁵⁷

The standard assertion that direct democracy is defective because its homo politicus premise is fallacious, i.e., that the populace lacks the presumed interest and requisite information, finds some support in this instance, a referendum in which the conditions for interest and acquisition of knowledge appear to be about optimal. The data suggest a dilemma for plebiscitary theory. If one points to the superior knowledge of the voters in the sample as evidence that the effective electorate is better informed, then one is snagged on the other horn. To the extent that

plebiscitary voting is well informed, it violates its own universalist ethic and vice versa. Of course this is a general dilemma, but surely it is more critical for direct than representative democracy.

Unless one equates a raw majority of private preferences with the public interest, a serious shortcoming of direct legislation is the likelihood that many ballots are tallies of private interest rather than judgments, informed or uninformed, of the public interest. It would seem that when the electorate supercedes the legislature, it also is acting in a representative capacity, being only a minor fraction of the community, and has the concomitant responsibilities of the acquisition of knowledge, consideration of intensities, deliberation, and an earnest quest for the public interest. Those are formidable tasks which many of the Toledo electors did not undertake.

There will be opportunity to take more soundings, because plebiscitary democracy apparently is cherished in those jurisdictions that have it. Responses of the Toledo sample to queries regarding the institution displayed intense populism; the institution was favored by an eight to one margin and four-fifths viewed the FHO as an uncomplicated question and proper for decision by plebiscite rather than city council, although simultaneously most respondents acknowledged a deficiency of information for doing it.⁵⁸ Significantly, the pro-FHO respondents also were favorable to plebiscites. Apparently fifty years later and despite talk about the complexity of public policy, there was little doubting of the Progressive rationale of direct legislation as the instrument for an enlightened citizenry to correct errors of unrepresentative, myopic, or venal legislatures. For students of politics the open housing referenda offer intriguing questions. Is direct democracy a superior instrument for policy making? Who is enlightened or myopic? Would the Progressives be gratified by this use of their nostrum?

A COMPARATIVE ANALYSIS OF SENATE HOUSE VOTING ON ECONOMIC AND WELFARE POLICY: 1953-1964*

AAGE R. CLAUSEN AND RICHARD B. CHENEY

University of Wisconsin

The manifest purpose of the roll call analysis described in this paper is that of demonstrating the existence of two policy dimensions in Congressional voting: economic and welfare. Support is sought for two propositions:

- I. Each of the two dimensions appears in both the House and the Senate in each of six Congresses, the 83rd through the 88th, 1953-1964;
- II. Roll call voting on the economic policy dimension is more heavily influenced by partisan differences while welfare policy voting is more subject to constituency constraints.

The second proposition is significant as an attempt to distinguish between a policy dimension on which partisan differences appear to be responsible for the greater part of the voting variation, and a policy dimension on which constituency factors have a substantial impact. This bears upon the *more general concern with distinguishing those party differences in voting behavior which are a function of an independent partisan factor from those which may be attributed to any number of factors correlated with partisan affiliation.*¹ This problem will be viewed from different analytic perspectives, including an analysis of the effects of intra-party and inter-party personnel turnover on the policy positions taken by representatives of the same constituency.

*The research here reported was assisted by a grant awarded by the Committee on Governmental and Legal Processes of the Social Science Research Council, by financial support from the Research Committee of the Graduate School, and by the National Science Foundation through its support of the University of Wisconsin Computing Center whose services were employed in the data processing. In addition, we want to express our appreciation to Brian Silver for his expert assistance on the project.

¹See Duncan MacRae, Jr., "Partisanship and Issues in Congressional Voting," Paper delivered at the 1968 Annual Meeting of the American Political Science Association, September 2-7, Washington, D.C. In relation to the differentiation of the impact of constituency and partisan factors see Lewis A. Froman, Jr., *Congressmen and Their Constituencies* (Chicago: Rand McNally and Company, 1963).

Instrumental to the testing of the propositions advanced above, but of independent interest as well, are two analytic themes: (1) the Senate-House comparison, and (2) the longitudinal analysis of legislative voting behavior. The Senate-House comparison is relatively unique in that such comparisons have seldom been undertaken; to our knowledge, none have been published using the type of measures employed in this study.² In the Senate-House comparison, the substantive interest will be foremost, although certainly more advanced comparisons of Senate-House voting will involve methodological issues of some complexity. In contrast, the longitudinal component of the present study involves a heavier methodological investment, including an evaluation of the evidence that the voting dimensions measured in successive Congresses are the same throughout. This evaluation will be conducted according to criteria specified in a model of measurement identity proposed earlier by one of the authors.³ In addition, we shall consider the meaning and the utility of the types of voting measures to be constructed. The latter consideration arises out of a particular orientation to the use of roll call voting data.

I. ORIENTATION

Legislative roll call analysis is commonly identified as the province of the specialist in the study of the legislative process. This can evoke rather tedious discussions about the merits of using roll call analysis to obtain an understanding of the manner in which legislative bodies process demand inputs.

It is our view that roll call analysis is equally, if not more, relevant to the study of public opinion and electoral behavior and other studies which focus upon the relationship between input variables that embrace the political system and output variables, as represented by

²Senate-House comparisons of roll call voting have been made utilizing other methods, e.g., David B. Truman, *The Congressional Party* (New York: John Wiley and Sons, Inc., 1959); Lewis A. Froman, Jr., *op. cit.*, pp. 69-84; H. Bradford Westerfield, *Foreign Policy and Party Politics* (New Haven: Yale University Press, 1955).

³Aage R. Clausen, "Measurement Identity in the Longitudinal Analysis of Legislative Voting," *this Review*, 61 (December, 1967), 1020-1035.

roll call voting measures, which are also systemic in scope by virtue of the representational character of the members of a legislative body. This view of the utility of roll call voting analysis is particularly appropriate *if the research strategy is one of developing measures of voting which represent the broader themes of policy cleavage such as economic policy and social welfare*. Such cleavages present the maximum potential for ordering Congressmen and other actors in the political system.

Clearly, there are limitations to this analytic approach. An ordering of legislators on a policy dimension does not give any measure of the magnitude of the legislative output. Secondly, a portion of the legislative output is the product of transient combinations of forces that emerge at different points in the legislative process and is not subsumed under the broader policy dimensions. Thirdly, roll call voting measures, taken as indicators of the total set of activities through which legislators affect policy, are lacking somewhat in reliability and validity.

With respect to the third limitation, it is our view that the weakness of voting measures as indicators of total legislative activity increases with a narrowing of the policy domain. Where the purpose of the voting analysis is to order legislators on broad policy dimensions, encompassing a variety of specific issue questions, the resultant measure is less subject to measurement error. Here we are proposing that the *mean* tendencies for individual legislators' voting acts will correspond to the *mean* tendencies of other legislative activities having to do with the full set of legislative proposals encompassed by the measure of a broad policy dimension.

The strategy of focusing roll call studies upon broad policy dimensions facilitates historical, as well as comparative, research for it enables one to use the policy domain as the comparative base. Thus, in preparation for the statistical analysis of the relations among roll calls, preliminary conceptual definitions of policy domains are used to sort roll calls into broad policy categories. Within each of the categories, the dimensional analysis is then undertaken. In the present study, the first part of which is presented in this paper, five policy domains have been defined: foreign, farm, civil rights and liberties, welfare, and economic policy. Within each of these, an interpretation of the policy content of the emergent dimensions is possible without an undue strain on the imagination. With the issue content fairly clearly defined, the analysis can be extended horizontally, as well as longitudinally.

In contrast, when a correlational analysis, such as cluster or factor analysis, is applied to

the entire set of roll calls in a particular session (or Congress), one is all too often faced with roll call groupings which are a substantive pot-pourri. Granted, an interpretation may be placed on these clusters in terms of the variety of factors which produced alignments on diverse issues that meet the terms of the statistical model used to establish dimensionality. However, comparisons over time, and across legislative bodies, may turn out to be exceedingly difficult because of the substantive complexity of the measures. In addition, there is the possibility that policy voting dimensions, which are conceptually distinct, may converge statistically at given points in time. This is to say that policy dimensions can not always be objectively identified in the statistical relationships between roll call votes.⁴

We wish to reassure our readers that while using preliminary definitions of policy domains, we rely upon objective statistical analyses of the roll call relationships *within* each policy domain to provide the basis for the construction of the measures of the policy dimensions. In addition, we consider the correlations *between* measures constructed in the various domains, in search of policy dimensions extending across policy domains, and between the voting measures and relevant variables. This provides a substantial body of evidence on which to base final interpretations.

II. MEASUREMENT AND IDENTIFICATION OF POLICY DIMENSIONS

As mentioned above, the analysis reported here is confined to two domains: welfare and economic policy. The basis for the distinction between the two domains is provided by an earlier analysis of House voting in the 83rd through the 86th Congress, which was based on a much smaller subset of votes than that in the present study.⁵ The content of the domains will be indicated later.

Clustering and Scoring Formats

Within each of the policy domains, a cluster analysis of the roll calls was performed for both houses in each Congress (across parties). This meant twenty-four independent cluster analyses on roll call subsets ranging in size from 24 to 138 roll calls. Clusters were defined by the criteria that the average Yule's Q correlation among all roll call pairings should be .70 or greater, and

⁴Duncan MacRae, Jr. and Susan Borker Schwartz, "Identifying Congressional Issues by Multidimensional Models," in *Midwest Journal of Political Science*, 12 (May, 1968), 181-201.

⁵Clausen, *op. cit.*

that no individual correlation should be less than .60.⁶

The clustering format represents a compromise between two goals: (1) producing clusters, and subsequently measures, which are relatively homogeneous, and (2) producing roll call voting measures which may be statistically differentiated in a subsequent correlation analysis. If the correlation criteria are set too high, a number of clusters may be identified which are so highly correlated that the measures constructed on them can not be differentiated in their relationships to other variables. If the correlation criteria are set too low, homogeneity is reduced and interpretation becomes more difficult.

The cluster analysis provided a check on our definition of policy domains by requiring that objective statistical criteria are met before measures of policy dimensions are constructed. Once the roll call clusters had been defined, the next step was that of constructing the voting measures on which the legislators would be ordered. We used a scoring procedure in which a positive vote was scored 1, a negative vote scored 3, and the absence of a recorded vote or announced position scored a 2. The positive vote, or position, was arbitrarily designated for one roll call in the cluster, with votes on all other roll calls in the same cluster assigned positive and negative positions so as to produce positive correlations among all roll calls. A mean score was computed for each legislator whose position was known on 50 percent or more of the roll calls in a given cluster.⁷ The individual scores vary from 1 to 3 and are indicators of the

⁶ The .70 correlation criterion is approximately equivalent to the standard .90 level of reproducibility used in Guttman scaling. However, it should be noted that the requirement of a minimum of .60 for individual roll call pairings has, in practice, yielded clusters dominated by inter-item correlations of .80 and above. The setting of a minimum correlation of .60 for individual correlations guards against the possibility of an item with an extreme division being included in a cluster despite wildly fluctuating correlations that average out to .70 or better. The exclusion of such items is justified on the grounds that highly variable correlations are poor indications of a common underlying dimension. Actually, this danger had already been minimized by excluding items more extreme in their division than 90-10. For a discussion of the use of Yule's Q in roll call analysis, see Duncan MacRae, Jr., "A Method for Identifying Issues and Factions from Legislative Votes," this REVIEW, 62 (March, 1968), 909-926.

⁷ The scoring was performed using a program constructed by Keith Billingsley.

relative proportion of positive and negative responses, with a regression toward the score of 2 as a function of absences.⁸

Cluster Analysis Results

The cluster analysis of the welfare and economic policy roll calls in the House and Senate produced a dominant cluster within each domain, in each house, and in each Congress. This "primary" cluster always contained over twice the number of items in the next largest cluster and, on the average, accounted for 65 percent of the roll calls in the domain.

These results provided an early indication of a major policy dimension within each domain that extended across the six Congresses. This was also indicated by the continuity of the legis-

⁸ There are two aspects of this scoring procedure which require explanation in terms of the assumptions made: (1) the scoring of absences, and (2) the simple summation scoring. One alternative to our scoring of absences would be that of excluding absences in the scoring. This assumes that the roll calls on which no absences are observed, with respect to each legislator, are a representative sample of the set of roll calls in the scale. We prefer not to make this assumption, treating the absence instead as partially a function of indifference or abstention. In each case, a middle scoring for the legislator is a reasonable option although more elaborate procedures might be used such as scoring absences according to a mean computed for the entire body on the given roll call.

The second feature of the scoring procedure, the simple summation of values across roll calls, recognizes that individuals occupying the same position on a policy dimension may have somewhat different voting patterns. They are assumed to be alike only in the probabilities of voting Yea and Nay, probabilities which vary between 0 and 1 probabilities assumed by the Guttman scale model. Only across a number of roll calls will the order positions on the dimension become clear as individual idiosyncracies are absorbed into the more general pattern of voting.

Actually, the scoring technique does not produce results which deviate sharply from those obtained by the Guttman scoring method. The scoring procedure does relax the deterministic response criteria of the Guttman model. On the other hand, the requirement of high Yule Q correlations among roll calls places constraints on the variations in the voting patterns of individuals assigned the same score. For a discussion of probability models and the simple summation scoring of monotone items, see Warren S. Torgerson, *Theory and Methods of Scaling* (New York: John Wiley and Sons Inc., 1958), pp. 360-402.

lative content of the primary clusters over time. Furthermore, a comparison of the content of the primary clusters in the two bodies shows a high degree of similarity between the House and the Senate.

In the Senate-House comparison, a distinction is made between the content of the roll calls identified with the primary clusters in each domain, and the set of votes associated with all other clusters. The comparison is based on those content categories in which ten or more roll calls were taken some time during the six Congresses in at least one house; in addition, as an aid to interpretation, we have also included all those categories exclusively identified with either the primary or the "other" clusters, in either house (Table 1).

A distinct pattern emerges in the association of content categories with the primary and other clusters in the two houses. This pattern shows the content similarity of the two sets of clusters across the two houses and reflects differences in the two institutions. The pattern is Guttman-scalar in form: (1) there are categories for which the primary cluster is dominant in both houses, (2) categories for which the primary cluster is dominant in the House but not in the Senate, and (3) categories where the primary cluster is dominant in neither house. In only one category, old age pensions and public assistance, is the primary cluster dominant in the Senate but not in the House. Thus, the difference in the cluster structures in the two bodies is that the Senate produces more roll calls in the content categories which are not assigned to the primary cluster.

The institutional differences reflect the fact that the Senate takes more roll calls than the House and entertains a greater variety of amendments. The more detailed consideration of legislation in the Senate increases the possibility of a greater differentiation in the substantive issues which are brought to a vote and correspondingly, a greater complexity in the dimensional structure.

The evidence on the content similarity of the primary clusters within each domain encourages us to propose that there is a policy dimension in each policy domain which is the same in both houses. Central to the hypothesized economic policy dimension are the recurring topics of public power, atomic energy, deficit financing, housing mortgage and interest policy, and public works (including anti-recession public works spending). Topics less frequently voted on but exclusively identified with the economic policy dimension are air and water pollution, anti-trust, sale of government-owned rubber plants, wage-price controls, 160 acre limit on federal ir-

rigation allotment per user, and the transfer of government civilian work to private industry. The issues involved here are most familiar as ones related to the conflict between *liberal, public-oriented economic policy* and *conservative, business-oriented economic policy*: government ownership and regulation of economic enterprise, government spending versus private incentives to economic stability and growth, tight versus easy credit policy, and the private versus the public development of natural resources.

The welfare policy dimension is dominated by legislation on public housing and urban renewal, labor regulation, education, and employment opportunities and rewards. The tight identification of legislation on tidelands oil rights and federal pre-emption of state legislative powers with the welfare dimension may appear somewhat strange. However, there are indications that welfare policy considerations are involved in both cases. Thus, with respect to the pre-emption issue, some Congressmen argued that those who supported states' rights had also been those opposed to federal social welfare legislation.⁹ With regard to the tidelands oil controversy, the desire for federal control of oil revenues for social welfare purposes is evident in proposals to use the revenue for federal aid to education.¹⁰

In general, legislation on the welfare dimension involves a relatively direct intercession of the government on behalf of the individual, cushioning him against the jolts administered by the economy, assisting him in coping with more powerful economic elements, and aiding him in getting the equal chance that the ideal of equal opportunity demands. Economic policy is relatively less direct in its impact upon the individual; it is more concerned with the provisions to be made by the government for maintaining the economy on an even keel, supporting its development in particular areas, and defining the public interest in relation to private economic interests.

The proposition that two dimensions, economic and welfare policy, are being measured by the primary clusters in the two policy domains requires further testing. The criteria to be used are drawn from a *model of measurement identity* proposed by Clausen (see fn. 3). One of the three criteria proposed, that of content similarity in the roll calls included in measures of the same dimension, and differentiation of content across dimensions, has already been considered. The other two criteria involve: (1) the

correlations among the scales measuring the two dimensions, and (2) the correlation of those scales with other variables. We shall apply the first of these two criteria in the next section.

This criterion states that *measures of the same dimension at different points in time should be more highly correlated than measures of different dimensions.*

Inter-scale Correlations

Inspection of the inner-scale correlation matrix shows the degree to which the present data fit the measurement identity criterion for inter-scale correlations (Table 2).¹¹ In the House this criterion is reasonably well-satisfied (remember that small differences in correlations are much more significant among upper range values such as these than they are for lower range values—simply think in terms of r^2 rather than r). The one scale in the House which clearly fails to meet the inter-scale correlation requirement of the measurement identity model is the 84th welfare scale. This scale has consistently higher correlations with economic scales than with welfare scales.

In the Senate, the 83rd welfare, and the 87th and 88th economic scales fall short of expectations. The 88th economic policy scale is most deviant; its correlations with welfare scales are, with one exception, higher than its correlations with economic policy scales.

When the measurement identity criterion for inter-scale correlations was proposed it was recognized that there was one particular difficulty with this criterion. It assumes that legislators will not shift their positions appreciably from one Congress to the next. If such movement does occur, the correlations between measures of the same dimension will be reduced. Concomitantly, correlations between measures of different dimensions may either increase or decrease. This weakness of the criterion becomes most apparent when a distinction is sought in the measurement of two dimensions as highly correlated as in the present case. We shall return to this problem later when we consider the regional-party alignments on the two dimensions. Let us turn now to the remaining test of measurement identity, the correlation of the scales with other variables.

Voting Correlate Analysis

The measurement identity model states that *measures of different dimensions will be different in their correlations with other variables, and that the pattern of correlations will remain constant over a period of time although the magnitudes of the correlations may vary.* Thus the case may be that measures of dimension A are more highly correlated with variable X than measures of dimension B, whereas measures of dimension B are consistently more highly correlated with variable Y. Yet the absolute magnitude of the correlations may vary. Take, for example, the case in which the party lines are gen-

erally more sharply drawn in a particular Congress. This would produce higher correlations of party across all party related dimensions, yet the *relative* magnitudes of the correlations of party with different dimensions would be expected to remain constant. Let us turn now from the hypothetical illustration to consider, first, the correlation of party with the measures of the two dimensions and, second, the relationships of constituency characteristics to the two dimensions.

The relationship of party to welfare and economic policy voting is presented in terms of the proportion of scale variance "explained" by party (Table 3). An entirely consistent pattern emerges with the proportion of scale variance explained by party being higher in each Congress for the economic policy scales.

The distinction between the two dimensions is particularly sharp in the House, with the difference in the "explained" scale variance ranging from .15 to .62, producing a mean difference of .38. In the Senate, though the explained variance differences are less sharp, they are consistent, varying from .07 to .34 with a mean difference of .21.

The consistent difference in the magnitude of the correlations of party with the economic and welfare policy scales support the proposition that two distinct dimensions are being measured by the scales in the two houses across six Congresses. The maintenance of the difference in the party associations, in the face of deviations from the expected inter-scale correlation pattern, suggests a repositioning of members within either one or both of the parties, while the overall relationship between Democrats and Republicans remains relatively constant. Further support for the welfare-economic policy distinction is found in the relationship of constituency characteristics to voting positions.

Two constituency characteristics, urbanization¹² and blue collar percentage of the labor force,¹³ were correlated with economic and

¹² Urbanization measure on Congressional districts is percentage urban minus percentage rural, based on data provided by "Congressional Quarterly Weekly Report, No. 5" (February 2, 1962), pp. 156-159. Urban areas contain a central city of 50,000 or larger, including suburban areas containing a city of 100,000 or larger; suburban areas consist of closely settled areas contiguous to central cities; rural areas contain cities smaller than 50,000. The urbanization index for states is a weighted composite of the district indices.

¹³ Percentage blue collar measure on Congressional districts is based on data provided by "Congressional Quarterly Weekly Report, No. 29" (July 20, 1956), p. 853. The blue collar definition in-

¹¹ The correlations reported here and in the remainder of the paper are Pearson r 's.

\bar{x}	.48	.68	.43	.81	.21	.38

welfare policy measures for each house and within each party (Table 4). The pattern conforms to the measurement identity model criterion, with the three exceptions noted in the table. It is a pattern in which measures of the welfare policy dimension are more positively correlated with the constituency variables than are measures of the economic policy dimension. This observation encompasses those instances in which "more positive" means "less negative."

An interesting aspect of these data is the strength of the *negative* relationship between urbanization-blue collar and liberal economic policy during the Eisenhower administration among Republican Senators. This relationship also holds among House Republicans, but at a much lower level.

The negative relationship between urbanization-blue collar and liberal economic policy among Republicans during the Eisenhower administration is reminiscent of the urban-rural, East-West, pro-business-anti-business political theme extending back at least as far as the populism of the post-Civil War period of the 19th century. In this view, Republicans from urban areas respond to the dominant financial and business interests in their constituencies while those from more rural areas oppose an economic policy designed to benefit those interests. The strength of this relationship during the Eisenhower administration is understandable to the extent that pro-business sentiments so clearly expressed by Eisenhower served to accentuate this historical cleavage.

Whatever the validity of these interpreta-

cludes craftsmen, foremen, machine operators, private household help, service employees, and all laborers except those who work on farms. The state measure of blue collar is a weighted composite of the district indices.

tions, the evidence is circumstantial. We are more impressed with the implications of the full set of data on both parties for the proposition that *increasing urbanization-industrialization is generally productive of forces that demand a liberal public policy, or what is thought of as liberal policy*.¹⁴ This proposition appears tenable for social welfare when the relevant constituency variables are assumed to be characteristics of the occupational and ecological structures of the constituencies. However, when the policy at issue is economic, the relevant constituency characteristics may be, to a larger extent, the financial and corporate structure of the constituency. The heavier concentration of financial and industrial organizations in the urbanized areas implies a conservative attitude on economic policy, independent of the attitude on welfare policy, which may be much more liberal. Although the influence of these conservative constituency elements would appear to be most effective with respect to Republican legislators, the lower correlation of urbanization-industrialization with economic policy, relative to welfare policy, observed among Democrats is entirely consistent with this viewpoint.

Another perspective on the voting alignments on economic and welfare policy dimensions is provided by a regional-party breakdown. In this breakdown, Democrats and Republicans were sorted into three groups: *Coastal* (Northeast, Middle Atlantic, Far West), *Interior* (North Central, Border, Mountain), and *South*.¹⁵ For each regional-party grouping a weighted mean score was computed for the four Congresses of the Eisenhower administration (83-86) and the two Congresses serving under Kennedy and Johnson (87-88).¹⁶ The results are shown in Figure 1, where the mean scores are represented by the center-most extensions of the bars in a

¹⁴ This proposition is implied at different points in the literature but we have found no author who states it clearly enough to warrant citation.

¹⁵ *Coastal*: Alaska, Hawaii, Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont, Delaware, New Jersey, New York, Pennsylvania, California, Oregon, Washington; *Interior*: Illinois, Indiana, Michigan, Ohio, Wisconsin, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, Kentucky, Maryland, Oklahoma, Tennessee, West Virginia, Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming; *South*: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas, Virginia.

¹⁶ Mean scores computed on the individual Congresses in each set are sufficiently homogeneous to warrant the aggregation for each set.

^a Data on constituency characteristics for the 88th Congress comparable to that used on preceding Congresses was not available for the large number of new districts formed in the 88th.

^b Denotes instances where urbanization-blue collar measures are more highly correlated with economic policy than with the welfare policy scale for that Congress.

format which shows the conservatism of each group. Both Senate and House voting patterns are shown, with Southern Republicans excluded due to insufficient cases. We can report, however, that Southern Republicans are at least as conservative as Coastal and Interior Republicans on all measures.

There are three sets of observations to be made: (1) the high degree of similarity between the Senate and House voting alignments within each of the Congressional periods, (2) the differences with respect to economic and policy voting alignments, and (3) the differences between the two Congressional periods. It will not always be possible to delineate one set of observations from the other in the presentation.

The similarity between Senate and House voting patterns in the two periods is most striking. It is all the more impressive because the similarity embraces both the differences between the economic and welfare policy alignments and the differences on each dimension observed between the Eisenhower and Kennedy-Johnson Congresses.

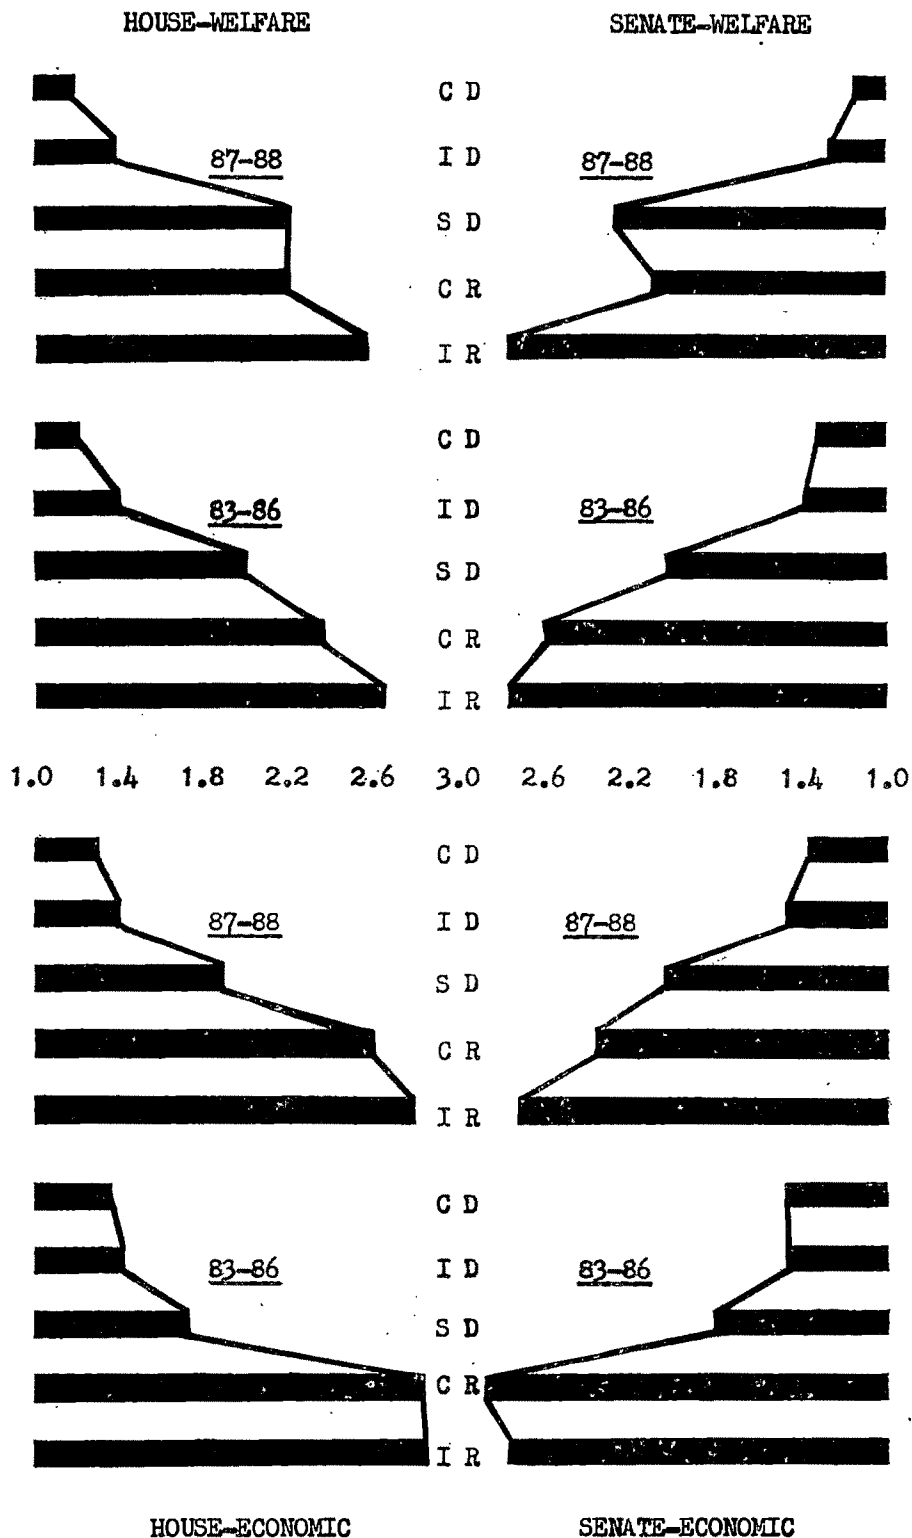

The parallel changes in the regional-party voting alignments, from the first to the second

set of Congresses, on each dimension in both houses suggests that *the same set of forces are operative on Senators and Representatives*. This is suggested as well in the preceding analyses of the content of the roll calls associated with the two dimensions in the two Houses and the constituency and party characteristics of the orderings on the two dimensions.

Much of the change in voting patterns between the Republican and Democratic administrations is accounted for by the change in the relationship between the scores of the Coastal Republicans and other members of Congress. On economic policy under the Eisenhower administration, Coastal Republicans are as conservative as Interior Republicans in both Houses, whereas under a Democratic administration, they take a more liberal position. At a lower order of magnitude, Southern Democrats appear to be relatively more conservative during a Democratic administration.

The changes in the mean scores of Southern Democrats and Coastal Republicans is of the same form with respect to welfare policy in both the House and the Senate. However, the changes are more pronounced in the Senate where

FIGURE 1. Regional-party voting

Coastal Republicans actually become more liberal than the Southern Democrats in the 87th and 88th Congresses.

In general, the level of party unity among Coastal Republicans and Southern Democrats is higher on economic than on welfare policy. This difference between the two dimensions is particularly marked in the 83rd through the 86th Congresses.

It is appropriate at this time to return to a consideration of the deviations from the measurement identity model that appeared in the interscale correlations. The greatest deviation occurred with respect to the 87th and 88th Senate economic policy scales which were correlated as high, or more highly with welfare policy scales as with economic policy scales. This deviation now becomes explicable as a result of the behavior of Coastal Republican and Southern Democratic Senators. The change in the positions of these two sets of Senators, from the Republican to the Democratic administrations, produces a convergence between the 87th and 88th economic policy scales and the welfare scales.

However, this level of explanation for the statistical convergence of the economic and welfare scales in the Senate does not suffice to resolve the primary question: Is there a new economic policy dimension that appears in the 87th and 88th Senates, or is there a single dimension in these two Senates which includes welfare and economic policy roll calls, or do we stick to the proposition of bi-dimensional continuity throughout the entire period? We prefer the third alternative for the following reasons:

- (1) The consistency of the other indicators (tests) in support of the original proposition.
- (2) The fact that most of the change that occurred was on the part of a single regional-party grouping, Coastal Republicans, with some change on the part of Southern Democrats, while the other three groups remained fairly constant. If a new dimension had emerged one would have expected more diffusion in the re-ordering of positions.
- (3) The turnover in the occupancy of the White House. This is considered to be more likely to produce changes in the positions taken by selected members of Congress than to alter the basic cognitive and attitudinal structures of the members. Such changes in position have been noted on foreign policy for the Truman-Eisenhower and Eisenhower-Kennedy turnovers.¹⁷

¹⁷ Mark Kesselman, "Presidential Leadership in Congress on Foreign Policy: A Replication of a Hypothesis," *Midwest Journal of Political Science*, 9 (November, 1965), 401-406.

While on this issue we would like to comment briefly on the other two deviant scales: 83rd Senate and 84th House welfare. In the first instance, it is again the Coastal Republicans who are primarily responsible, for in this first Congress of the Eisenhower administration, and *only* in this Congress, they took a slightly more conservative position than their land-locked brethren. This then made that particular welfare scale resemble the economic scales in its voting alignment. Perhaps this was an expression of loyalty to the new Republican in the White House. Indeed, the whole pattern of Senate Coastal Republican voting reflects a certain level of sensitivity to the President. In the second instance, the 84th House welfare scale, it is the Southern Democrats who have a brief fling at strong party loyalty on welfare policy, with no discernible prior warning of this turn of events, and certainly no indication of any after-effects.

The evidence in the present case leads us to conclude that there is a welfare policy and an economic policy dimension which extend across the six Congresses and are the same in both houses. This inference is based on the consistently higher correlation of party with the economic policy measures, the higher positive correlations of constituency characteristics with welfare policy scales, the different patterns of regional-party alignments on the two dimensions, and the pattern of inter-scale correlations. Comparability between the House and Senate is further supported by the content of the legislation associated with the two dimensions in the two bodies. The inference of measurement identity and differentiation is instrumental to the following analysis of stability and change with respect to individual constituency positions on the two dimensions.

Stability and Change

An analysis of stability and change in legislative voting behavior has obvious implications for an understanding of the response of a representative legislative system to policy demands. What does past experience indicate to be the means through which change comes about: Is change in the representation provided a constituency effected by partisan turnover, by a change in the personnel without partisan turnover, or can it be observed for individual members serving in successive Congresses? What is the relative importance of these conditions for change from one policy dimension to the next?¹⁸

¹⁸ Previous studies concerned with the impact of personnel turnover include Lewis A. Froman, Jr., *op. cit.*, especially Chapter 8; and Lee Anderson,

There are three conditions to which our analysis of stability and change will direct its attention: (1) the same person serving in successive Congresses, (2) *intra-party* personnel turnover, and (3) *inter-party* personnel turnover.

Before the results of this analysis can be presented we must return once more to problems of measurement. The problem that confronts us is that of achieving scale scores which can be compared over time. It will be recalled that the original set of scale scores consisted of mean scores computed for each individual after a positive response, a negative response, and an absence on each roll call had been scored 1, 3, and 2 respectively. The comparison of such scores between time-1 and time-2 increases in validity as the roll calls included in the respective measures approach a representative sample of the universe of items relevant to a particular dimension. However, the set of roll calls in a given measure may be biased in one direction. Consequently, members whose positions have not changed may appear to have changed if one looks at their scale scores in successive Congresses. For example, if the set of items in Congress A are biased in the liberal direction compared to those in Congress B, members of Congress A are expected to have less liberal scores than members of Congress B, even though their true positions have remained unchanged.

In an attempt to control on this form of bias, the scores of all members in each Congress were adjusted to the mean score of the members who served continuously throughout the twelve-year period. The assumption is that changes in the collective mean score for the continuous members represent the effects of item bias in the

TABLE 5. MEAN CHANGE SCORES

	Senate		House	
	Economic	Welfare	Economic	Welfare
Continuous member (1)	.21	.21	.18	.27
Intra-party turnover (2)	.31	.39	.27	.40
Inter-party turnover (3)	1.23	1.26	1.44	1.08

measures used in the different Congresses. This involves the further assumption that the continuous members, *as a body*, have not shifted their position.

It is granted out of hand that this adjustment of scores falls short of an adequate solution to the problem of creating interval level scales that are invariant across Congresses. All we can say is that it seems more probable that there is sampling error in the item selection than that, in this particular case, 178 members of the House and 41 members of the Senate have moved *collectively* in a conservative or liberal direction. Indeed, the continuous members are as unlikely as any, because of their safe seats, to shift their positions in response to external pressures.

After the raw scores had been adjusted, change scores were computed for each pair of adjacent Congresses on each seat, and a mean change score computed across the five adjacent Congress pairings for each of three conditions: continuous member, intra-party turnover, and inter-party turn-over. The results are presented in Table 5.

The order of change is generally in line with expectations, individuals changing the least and inter-party turnover generating the most change. The change for individual members is little more than a tenth of the total range of scores on the individual scales. The low order of change observed for the intra-party turnover is understandable in that the same party and constituency constraints are operative on the new member as they were on the incumbent. The relationship between the two conditions, continuous member and intra-party turnover, can be represented by a ratio of the change observed for the latter condition to that for the former. This ratio allows for variation in measurement error across dimensions. In terms of this ratio, the level of intra-party change appears very similar across both dimensions and both houses. In three instances the ratio is 1.5; it inches up to 1.9 on the Senate welfare dimension.

Whereas the change associated with intra-party turnover is relatively constant across the two dimensions in the two houses, the inter-party turnover change scores vary substantially,

"Individuality in Congress: A Research Note," *Midwest Journal of Political Science*, 8 (November, 1964), 425-429. Using a measure based on votes on reciprocal trade legislation, Froman concludes that districts represented by the same individual through several Congresses exhibit more stability than do districts characterized by a substantial turnover in personnel. He does not address the question of what occurs when the partisanship of the districts' representation changes. Anderson tests and confirms Froman's hypothesis, using both foreign involvement and domestic liberalism-conservatism scales. Also, see Clarence N. Stone, "Issue Cleavage Between Democrats and Republicans in the U.S. House of Representatives," *Journal of Public Law*, 14 (1965), 343-358, for a discussion of the impact of change in the partisan representation of a district. Stone suggests that the impact varies substantially among different policy areas.

and they are also of much greater magnitude.¹⁹ Once again, let us consider these in terms of a ratio, inter-party turnover change to continuous member change. The largest ratio value (8.0) is observed on House economic policy, the smallest value (4.0) on House welfare policy, with both the economic and welfare policy ratios in the Senate, 5.8 and 6.0 respectively, falling midway between the two House ratios.

The particular value of longitudinal analyses is that they permit an approximation to experimental design in some instances. In the present case, we are emboldened to say something about the relative influence of partisan and constituency factors on welfare and economic policy voting. The evidence is provided by the change ratios associated with partisan turnover. The analytic design is as follows.

The unit of analysis is the constituency, with the member of Congress viewed as the medium through which partisan and constituency factors are expressed. Constituency factors are assumed to be constant over the time periods for which the change measures are computed. These are four-year time periods, including the last term of the incumbent and the first term of the freshman member for each constituency in which a partisan turnover has occurred. The assumption that constituency factors are constant refers to an objective level of influence exerted by these factors, with the *perceptions* of the constituency factors treated as a source of variation in the behaviors of the individual representatives.

While the constituency influence is held constant, the partisan influence is indicated by the difference in the policy positions taken by the new member of one party and the incumbent of another party. The implication that follows from the assumption of constancy in the constituency pressures is that the stronger those constituency pressures *relative* to partisan pressures (whatever the specific components of either may be), the smaller the change should be when there is a partisan turnover in the representation of a constituency.

The import of the data analyzed thus far is that the relative influence of party is greater with respect to economic policy as constituency factors have a greater impact on welfare policy voting. However, the previous set of data have not been so definitive in this respect that further analysis is redundant. Therefore, let us return to an examination of the party change (or

partisan turnover) ratios presented previously:

House Economic Policy: 8.0 Welfare Policy: 4.0
Senate Economic Policy: 5.8 Welfare Policy: 6.0

The proposition that party is relatively more influential on economic policy voting is supported in the House but not in the Senate; in the House the party change ratio on economic policy is twice that on welfare policy whereas in the Senate the difference is insignificant and contrary to the proposition. However, these institutional differences are so interesting in themselves as to take some of the sting out of the blow administered to the proposition by the Senate.

The low value of the party-change ratio on House welfare policy, compared to the higher ratio value on Senate welfare policy, is consistent with institutional differences. It is understandable that the House member should be more subject to constituency pressures than the Senator in view of the greater level of homogeneity of House constituencies. The House member can respond to relatively clear constituency voting cues. In contrast, the Senator with a more heterogeneous constituency, unable to identify clear constituency instructions concerning his behavior, is less constrained by constituency pressures. In the absence of clear constituency constraints, the higher partisan influence reflected in the party-change score on Senate welfare policy may reflect the necessity of relying more heavily on partisan ideology or partisan positions. Alternatively, in the absence of clear constituency cues, the Senator may feel there is less danger in expressing partisan views as the most appropriate governmental response to constituency demands or needs.

The lower level of the party-change ratio on Senate economic policy, relative to that of the House, may indicate that the Senator is not as tightly bound by partisan influences on a dimension where such influence is uppermost. This is not inconsistent with our observations on welfare policy for we did not suggest there that the Senator was bound tightly by partisan constraints, rather that he had to rely upon them, or had the opportunity to express them, to a greater extent than the House member. Here we are suggesting that the Senator is no more bound by partisan constraints on economic policy than he is by constituency constraints on welfare policy.

House members, on the other hand, may be much less able to withstand partisan pressures on economic policy, or be much less disposed to, in the absence of strong constituency pressures. In the words of Sam Rayburn, the House mem-

¹⁹ With one exception, a Democratic Senator replacing a Republican Senator in Ohio, partisan turnover produces a change in the expected direction: a Democratic legislator more liberal than a Republican.

ber has to "get along" if he wants to move into positions of influence or obtain support for his own legislative requests. Nor does the individual House member possess the opportunity of the individual Senator to build a personal public reputation to compensate for his legislative ineffectiveness.

In general, these findings reflect the common view of the free-wheeling, nationally oriented Senator operating in the smaller, more loosely organized body and the cautious, locally oriented Representative "getting along" in the larger, more tightly organized House. It would appear that the House member is more tightly circumscribed in his behavior. On the dimension where party influence is considered to be the greatest, the House member is more responsive to party influence than his Senate colleague; where constituency is considered to be relatively more important, the House member is relatively more subject to constituency constraints. This does not mean that the Senator is not also affected by these constraints, only that he appears to be less so.

III. SUMMARY

In our opening remarks, the manifest purpose of this roll call analysis was stated to be that of demonstrating the presence of two policy dimensions, economic and welfare policy, in the voting of Senators and Representatives during the 83rd through the 88th Congresses. Evidence in support of this proposition has been presented in accordance with the criteria of a model of measurement identity. It consists of inter-scale correlations in each house, an examination of the content of the roll calls associated with the two dimensions, and correlations of the measures of the two dimensions with constituency characteristics and with party.

It was further proposed that partisan differences would be more relevant to economic than to welfare policy voting. The evidence used here was drawn, in large part, from the evidence used to substantiate the first proposition; this is consistent with the inter-dependence of the two propositions. In addition, a stability and change analysis gave additional support to the proposition in relation to House voting, leaving open the question of its applicability to Senate voting.

Also suggested in the introductory remarks, was the value of utilizing preliminary definitions of roll call policy domains prior to the objective statistical search for voting dimensions. One advantage is that of establishing the bases of longitudinal and comparative analysis in terms of subjectively discriminable policy domains. Our analysis has indicated also that the distinction between highly correlated policy dimen-

sions may become blurred if an objective analysis of roll call interrelations is applied across policy domains. This becomes particularly evident in a longitudinal analysis in which statistical convergence and divergence of policy dimensions have time to appear, so to speak. It is clear that our view of the voting patterns would have been somewhat different if the entire set of welfare and economic policy roll calls in each Congress had been subjected to a common correlational analysis. This is not to claim that the approach we have used is superior; it is to suggest that the choice to be made is neither inconsequential nor self-evident. However, to the individual with an interest in issues, only a moderately high tolerance for abstraction, and some skepticism as to the potential of uncompromising objectivity, the advantages of the policy domain approach may be highly persuasive.

One of the more unique aspects of the present study has been the comparison between Senate and House voting. Firstly, it was observed that House voting is more simply structured than Senate voting. Thus, for both policy domains a larger proportion of the House votes were included within the primary clusters associated with each of the major policy dimensions. This finding was attributed to the greater opportunity for detailed consideration of legislation on the floor of the Senate which, in turn, induces a greater complexity in the dimensional structure of the set of Senatorial voting acts.

Secondly, the analysis has indicated that Senators are less subject to constituency pressures and more independent of partisan constraints. With respect to Coastal Republicans and Southern Democrats, there is also some indication of a higher level of responsiveness to factors associated with a partisan turnover in the White House. This is a particularly interesting area for further analysis because the responsiveness of these two groups to changes in the occupancy of the White House is consistent with the relative absence of mutually reinforcing partisan and constituency referents. In terms of the dominant historical urban-rural, Democratic-Republican parallel, Coastal Republicans and Southern Democrats are political anomalies.

Thirdly, and most importantly, this study has provided substantial evidence of a similarity in the dimensional structure of voting on economic and welfare policy in the Senate and the House. If parallel dimensions emerge in other policy domains, it suggests that Congress may be viewed as a political subsystem in which values are allocated within a common frame of reference. Furthermore, in the absence of evidence that Congress is a subsystem that rapidly socializes its

members with regard to modes of cognition and perception, the finding of parallel dimensions in the two houses suggests that these dimensions penetrate the political strata from which Congressmen are recruited. Thus the new member is already accustomed to viewing specific policy questions in terms of more general policy categories.

More generally, with respect to public opinion, it would be of considerable interest to re-examine studies of public opinion in different political strata to determine the penetration of the economic-welfare policy distinction downward from political elites to the political mass. An earlier study has indicated that the personal attitudes of members of the House can be differentiated with respect to welfare and economic policy.²⁰ What are the limits on the penetration of this policy distinction down through the political strata? Is there sufficient penetration to warrant the conclusion that partisan ideology is involved in the attitudes on economic policy whereas social welfare attitudes have other origins? For example, does the welfare-economic policy distinction carry down through those political strata which include people who are subject to partisan socialization of political attitudes and disappear when that form of political socialization is the weakest? More generally, we are suggesting that studies of legislative voting behavior can be particularly useful in measuring policy dimensions that are relevant for one set of political elites, and possibly relevant for a more inclusive set, with the degree of penetration down through the political strata a matter of theoretical interest, not only in terms of the mechanisms of political socialization, but in terms of the linkages between the electorate and the policymakers.²¹

²⁰ Clausen, *op. cit.*, pp. 1031-1033.

²¹ Warren E. Miller and Donald E. Stokes,

Related to the penetration phenomenon with respect to dimensions of political attitudes is the comparison of Congressional voting with voting in the state legislative bodies, and other national institutions such as the Supreme Court. In the last instance, Guttman scale and factor analysis of Supreme Court decisions has shown the presence of an economic liberalism dimension which appears to be highly similar to the economic policy dimension in Congressional voting.²²

Whatever the cite of the public opinion or voting analysis, there is a case to be made for a high degree of sensitivity to the policy component, as opposed to the alignment component, of the analysis. A policy orientation leading to subjective divisions of items into policy domains provides the basis for comparative and longitudinal studies. In addition, without such considerations of policy content, the analyst is likely to become the victim of his objective procedures. Thus, the dimensional structure which is identified is, in part, a function of the criteria used to define clusters, factors or dimensions. The more stringent these requirements become, the greater the complexity of the dimensional structure. Finally, as we have indicated previously, the totally objective analysis is inadequate to cope with the problems involved in the change of positions by individuals over time; this problem is stated most briefly as that of convergence and divergence among policy dimensions.

BASES OF SUPPORT FOR MEXICO'S DOMINANT PARTY*

BARRY AMES

Stanford University

The purpose of this paper is to elucidate the bases of support for Mexico's *Partido Revolucionario Institucional*. A model is developed which identifies the major and minor variables affecting changes in *PRI* support in the six elections between 1952 and 1967. Throughout the paper the unit of analysis is the state; the dependent variables are voter turnout and the percentage of the total vote in each state received by the *PRI*.

I. INTRODUCTION

The paucity of empirical works on electoral support for dominant-party regimes seems to indicate difficulties in data collection, not simply a dull topic. The emphasis on institutionalized parties in the works of such scholars as Huntington, Emerson, and Zolberg underlines the need for a better understanding of the roles played by such parties in nations at varying levels of development.¹ Models of electoral support should help us understand the techniques of social control available to elites, to predict changes in the party system, and to assess the effects of governmental outputs. Mexico is particularly interesting because it appears to be contrary to much of the political development literature, which suggests that oppositions are more likely to flourish as politics modernize, though. Yet Mexico is modernizing, the *PRI* so far shows no loss of support. In later sections of this paper I will speculate on the causes of this paradox.

First, however, let me explicate an assumption crucial to this research: that elections in a one-party system are a significant part of the political process. Mexicanists divide on this question, their opinions generally correlating with their estimates of the importance of the governing party in policy-making. Frank Brandenburg, who downgrades the policy influence of

the *PRI*, claims that "Elections, whether internal to the party or external and open to the public, are hardly more than travesties."² Robert Scott, who emphasizes the importance of the *PRI* in policy-making, claims that the *PRI* desires to maximize its vote, that differences in *PRI* percentages may stem from such variables as economic conditions or proximity to the United States, and that vigorous electoral activities, such as registration drives, reflect the party's use of the election as a barometer of public confidence.³ The empirical evidence seems to support Scott's position. Not only is there considerable electoral activity, but in some cases the *PRI* has actually suffered defeats.⁴

A broader answer to the question of theoretical relevance requires a consideration of the constraints on political mobility in Mexico. Since the party is highly centralized, gains in political status for middle-level elites depend on a favorable relationship with higher-level elites. Because the *PRI* dislikes evidence of dissatisfaction among the populace, the availability of a clear test such as an election becomes significant to elites aspiring to higher office. The election provides an opportunity to demonstrate political skill in the same sense that a machine politician in the United States tries to "deliver the vote." Hence elections in Mexico gain significance from the desire of elites to maximize support and from their importance in the recruitment process.

In the remainder of this paper we first consider a theoretical framework linking the vari-

Zolberg, *Creating Political Order: The Party States of West Africa*, (Chicago: Rand McNally, 1966).

ables in our model. Next, the directions of the relationships between the variables are predicted and the model is empirically tested. In the last sections we assess the validity of the model and attempt to explain the paradoxical nature of *PRI* support.⁵

II. THEORETICAL FRAMEWORK

When elections are hotly contested, the meaningful dependent variables are likely to be those identifying the winner or his party and measuring his vote total. Since the winner of a Mexican election is seldom in doubt, and because elections in Mexico usually indicate political skill and regime legitimacy, the number of people turning out on election day may be as interesting as the direction of the vote. Evidence for the importance of "getting out the vote" is provided by Scott in his description of voter registration efforts in the 1958 campaign.⁶ Feverish registration activity (which in the highly competitive Federal District could well have increased the party's percentage as well as total vote) seems to have been a result of the elite's belief that non-participation in the election is equivalent to apathy and non-support, and that apathy threatens the viability of the Revolutionary Ideology. In this sense turnout is both a "means" and an "end." Because turnout affects the *PRI* vote percentage, it is an independent variable; because the *PRI* acts to promote turnout, I also consider it as a dependent variable.

Factors that contribute to the electoral strength of the *PRI* may be divided into two categories: direct and indirect. By direct factors I mean those that the *PRI* or the government itself may manipulate in the period around the

⁵I also assume that the reported voting data are meaningful. A variety of error types is possible. Random error is not too important since it tends to lower correlations. A more significant problem stems from the frequent charges of fraud by opposition leaders. If there are inflationary biases in the vote totals, they could take three forms. Perhaps all *PRI* totals are padded by approximately the same amount. This would have the effect of adding a constant and would not seriously affect correlational measures. If the amount added is directly proportional to the percentage of the vote received by the opposition, gross inter-state differences would be reduced, but the rank order would remain the same. If, however, the amount added is related to some unknown variable not of these two types, my results might be seriously affected. At this stage of the research I have no alternative to using reported data.

⁶Scott, *op. cit.*, pp. 225-226.

election, such as vigorous campaign activity. By indirect factors I mean those that it can affect only over a long period of time or not at all (definitely not in the years between two elections). Because I wish to avoid giving an aura of precision to an inherently arbitrary categorizing process, this definition has been deliberately left vague.

Table 1 identifies some factors likely to influence elections in any political system. Obviously these have varying degrees of applicability and operationality in the Mexican case. In the next section we consider variables of particular relevance to Mexican elections, hypothesize linkages between independent and dependent variables, and describe the operationalization of each variable.

TABLE 1: A NON-EXHAUSTIVE AND PARTIALLY OVERLAPPING LIST OF DIRECT AND INDIRECT FACTORS AFFECTING TURNOUT AND DIRECTION OF THE VOTE

	Direct	Indirect
Turnout	Benefits (e.g., welfare payments)	Border with United States
	Campaign Issues	Climatic Conditions
	Development Projects	Direct Factors in Previous Elections
	Local Leadership	General Economic Conditions
	Monetary Incentives	During Election Period
	Number of Party Members	Historical Nonintegration
	Party Activity	Level of Development
	Registration	Long-term Benefits
	Registration Rules	Long-term Strength of Oppositions
		Turnout in Previous Elections
Direction of Vote	Benefits	Border with United States
	Campaign Issues	Direction of Vote in Previous Election
	Development Projects	General Economic Conditions
	Local Leadership	During Election Period
	Media Support	Historical Nonintegration
	Monetary Incentives	Level of Development
	Number of Party Members	Long-term Benefits
	Party Activity	Long-term Strength of Oppositions
	Turnout	

III. DEPENDENT VARIABLES

Direction of Vote. The major dependent variable in this analysis is the percentage of the total vote received by the *PRI* in six elections between 1952 and 1967. Three of these elections, 1952, 1958, and 1964, were Presidential elections; those of 1955, 1961, and 1967 were Congressional elections. For each state I have averaged the percentages received in the six elections. Since the six elections cannot be regarded as six separate samples, the number of cases is 32—the number of states in Mexico—rather than 192.⁷

⁷Election data sources are as follows: 1952,

Turnout-Direction Linkage. Voting participation has been identified as a dependent variable of significance in Mexico. Turnout is measured here by the percentage of eligibles voting in each election. Assessing the nature of the turnout-direction linkage requires a knowledge of the predispositions of new voters, since higher participation rates usually mean an influx of previously uninvolved individuals. Scholars are divided on the effects of new voters. Zolberg's work on West African one-party states suggests that high participation helps dominant parties:

... the basic notion that uninvolved individuals respond to the most powerful available stimulus, such as the one provided by a leading personality or an apparently powerful organization is perhaps relatively independent of the cultural context.⁸

A reasonable operationalization of Zolberg's point is as follows: the more a political system is dominated by a single personality or organization, the more the effect of additional voters will be an increase in the strength of the dominant personality or organization. Hence, the *PRI* should be helped by high participation.

The direction of this linkage has been challenged in a study of Mexican elections by Pablo Gonzalez-Casanova. He argues that low turnout helps the *PRI*, because those who vote present the least opposition to the regime. Noting that the poorest states in Mexico vote most strongly for the *PRI*, he contends that rural populations are unorganized and inexperienced in politics, and as a result are passive instruments of their leadership. Being poor and illiterate, their voting rates are lower than those of people in more urbanized states.⁹

Gonzalez-Casanova's position is unclear because it depends on the relationship between participation rates and poverty and urbanization. Since the hypotheses relating participation and direction of vote are contradictory, and since at this point we have no other basis for

predicting one way or the other, the turnout-direction linkage will be left open.¹⁰

IV. INDEPENDENT VARIABLES

Indirect Factors

Level of Development. Chief among the indirect factors of support is what will be called "level of development." There is a considerable literature arguing that oppositions flourish under conditions of high social mobilization, economic development, urbanization, and "modernization." Blanksten has made this argument for Latin America:

It is typical of Latin America that, with the exception of the landowners and the church, few interests arising in the rural areas are capable of making themselves heard in politics. In cities, however, interest groups form more readily and give voice to the demands of urbanized sectors of the population. Similarly, new interests find organized expression in consequence of the processes of restratification, secularization, and commercialization.¹¹

The effect of urbanization on the opportuni-

¹⁰ Turnout has been operationalized as the six-election average of the percentage of eligible voters who actually voted. Mexico does have a registration process, and there are differences between the percentage of the population registered and the percentage actually voting. But registration figures for all elections were unavailable, so registration had to be ignored. Turnout is defined as the percentage of the population legally eligible—irrespective of registration—who voted.

Turnout rates were calculated as follows: the actual number of people who voted in each state was computed from the election results (see footnote 7). The percentage of the population eligible to vote was arithmetically extrapolated from 1950 and 1960 population per state on the basis of each state's growth rate from 1950 to 1960 (these differ widely). For the 1952 election males over 20 were used as the base. In succeeding elections both sexes were used. There are two sources of error: arithmetic rather than geometric progressions, and the assumption of state equality in age distributions. The latter error may be significant but is unavoidable. The population figures come from the *Anuario Estadística de los Estados Unidos Mexicanos* (Secretaría de Industria y Comercio, Dirección General de Estadística, Mexico, 1965). (for 1962-63), p. 28.

¹¹ George Blanksten, "The Politics of Latin America," in Almond and Coleman (eds.), *The Politics of the Developing Areas*, (Princeton: Princeton University Press, 1960), p. 477.

1955, 1958, 1961 are from Pablo Gonzales-Casanova, *La Democracia en México* (Ediciones Era, S.A., 1965), pp. 240, 242-243, 241-247, in that order. The election of 1964 is from *Política*, (Sept. 15, 1964), p. xix. The election of 1967 is from *El Universal*, July 11, 1967, p. 9. The last election data are unofficial, but changes were very minor. Objection may be made to the combining of Presidential and Congressional election. While the fit of the model does vary among the elections, the basic model is not seriously affected.

⁸ Zolberg, *op. cit.*, p. 20.

⁹ Gonzalez-Casanova, *op. cit.*, pp. 106-107.

ties for oppositions has been explored by Ronald Ridker:

Costs to political agitators are lower in the city than in the country. The greater concentration of people, the propinquity to centers of political decision-making, and the greater degree of literacy in cities, also may result in a higher level of aspiration. In addition, urban life generates unrest, particularly for the new immigrant, because of the greater disparity in the ways of life of cities and farms . . . urban populations tend to be very responsive elements for radical propagandists.¹²

This does not mean that only leftist opposition activity is likely. The kind of competing-elites problem discussed by Shils and Eisenstadt increases the chances of opposition from either left or right.¹³ The fact that urban areas have a higher proportion of middle-class residents is emphasized by Lenski, who finds "a reaction to the exercise of power and privilege . . . in the efforts of members of the middle classes to gain control over powers, privileges, and resources traditionally reserved to the elite."¹⁴ That the electoral arena is a natural one for this contest is suggested by D'Antonio and Form's discussion of the most important opposition party, the National Action Party.

. . . its voting support has come from white collar workers, serious churchgoers, some small businessmen, and employees of the PAN activists.¹⁵

Urbanization is usually coupled with economic growth, which in itself can be a source of opposition. Mancur Olson stresses the diverse nature of the dissatisfaction that may arise in conditions of rapid growth:

Both gainers and losers from economic growth can

¹² Ronald Ridker, "Discontent and Economic Growth," *Economic Growth and Economic Change* XI (October, 1962), p. 11. Some of Ridker's argument is certainly debatable, especially in regard to new immigrants, but the essential point seems valid. See Wayne A. Cornelius, Jr., "Urbanization as an Agent in Latin American Political Instability: The Case of Mexico," this REVIEW, 63 (Sept. 1969).

¹³ Edward Shils, *Political Development in the New States*, (London: Mouton, 1965); and S. N. Eisenstadt, "Breakdowns of Modernization," *Economic Development and Cultural Change*, 12, pp. 345-367.

¹⁴ Gerhard Lenski, *Power and Privilege*, (New York: McGraw Hill, 1966), p. 65.

¹⁵ William D'Antonio and William Form, *Influentials in Two Border Cities*, (South Bend: University of Notre Dame Press, 1965), p. 37-38.

be destabilizing forces . . . economic growth increases the number of *nouveaux riches*, who may use their economic power to change the social and political order in their own interest; . . . economic growth may paradoxically also create a surprisingly large number of "*nouveaux pauvres*," who will be much more resentful of their poverty than those who have known nothing else.¹⁶

In addition, particular traditional factors may discourage opposition in less developed areas. L. Vincent Padgett argues that the norms of unanimity in decision-making and suspicion of outsiders combine to cause village Mexicans to protect rather than mobilize against the local boss. He further contends that "The farther from the effects of modernization, including education and transportation, the more dependent the people are upon their *caciques*."¹⁷

The above scholars are generally agreed that conditions in urban areas are more favorable to the development of oppositions.¹⁸ Thus we suggest that the higher the level of development in a state, the lower will be its PRI vote.

The effect of development on turnout is less clear. Daniel Lerner emphasizes urbanization as the prime mover in the process of modernization. He argues that:

. . . increasing urbanization has tended to increase media exposure; increasing media has "gone with" wider economic participation (per capita income) and political participation (voting).¹⁹

Lerner's analysis is based on the assumption

¹⁶ Mancur Olson, "Rapid Economic Growth as a Destabilizing Force," *Journal of Economic History*, (Dec., 1963), p. 533.

¹⁷ L. Vincent Padgett, *The Mexican Political System*, (Boston: Houghton Mifflin, 1966), p. 83 fn. Padgett's emphasis on the special characteristics of less-developed areas reinforces the notion that absolute levels of development may be more important than the relative positions of two or more states. For example, the difference between the levels of urbanization of Idaho and California, and Tlaxcala and the Federal District (Mexico City) may be equal; what is more relevant is the absolute position of all these places on a traditional-modern continuum.

¹⁸ There is also some inconclusive evidence suggesting a relationship between urbanization and party competition in the United States. For a review of this literature, see Philip Coulter and Glen Gordon, "Urbanization and Party Competition," *Western Political Quarterly*, XXI (June, 1968), 274-288.

¹⁹ Daniel Lerner, *The Passing of Traditional Society*, (Glencoe: Free Press, 1958), p. 46.

that the effects of the urbanization process ought to be most visible in the most urban areas, unless these areas have had long-static large populations. A subnational application of Lerner's argument leads us to expect high turnout rates in the more developed areas. Gonzalez-Casanova made essentially the same point in examining Mexican elections, but no supporting data was presented.²⁰

Evidently the association between development and participation is not universal. Steiner found that the norm of unanimity in decision-making, present in Japanese rural socio-economic units (*buraku*), tended to increase voting levels.²¹ And Dupeux found that in France, because of the higher average age of rural voters, the training citizens get in local politics, and various historical reasons, participation was highest in rural areas.²²

Since there is conflict in the literature, the direction of the linkage between level of development and turnout will be left unspecified at this point.

As an indicator of level of development I have used urbanization.²³ It is defined as the

percentage of the population in each state living in communities of more than 2500 people.²⁴

Historical Nonintegration. Certain states in Mexico have traditions of isolation and nonintegration vis-à-vis the national political and economic system. Four states seem particularly separatist. Yucatán has a long tradition of separatism and localism. Until 1950 the Yucatán peninsula had no unbroken land tie with the rest of Mexico, and the inhabitants once declared independence. Yucatán's problems were worsened by the failure of a government sponsored henequen growing cooperative in 1954.²⁵

A second state with a separatist tradition is Oaxaca, where citizens as late as 1952 held mass meetings asserting their desire for local autonomy. Although the situation is now improved, Scott claims that Oaxaca remains one of the least integrated areas in Mexico.²⁶

The Baja California region does not suffer from the poverty of the aforementioned areas, but it is geographically separated from the main land area. The northern part recently became a state, but both it and the territory of Baja California are still rather isolated.²⁷

From the foregoing discussion the direction of linkages between nonintegration and both turnout and direction of vote should be clear. I hypothesize that states (or territories) with such tendencies ought to have lower rates of turnout and lower percentages for the *PRI*.²⁸

Presence on the United States Border. Political systems do not exist in vacuums. A Mexican state is part of a system including other states, the Federal Government, and political actors of

²⁰ Gonzalez-Casanova, *op. cit.*, p. 106-107.

²¹ Kurt Steiner, Stanford University, unpublished paper, 1966. Similar findings about Malaya are presented by Richard Winters, Dartmouth College, in an unpublished paper.

²² Georges Dupeux, "France," *International Social Science Journal*, XII (No. 1, 1969), pp. 46-47.

²³ Objection may be raised to the use of this indicator of level of development. First many scholars cited in the above theoretical section explicitly use urbanization as their variable. Second, as Schnore found, urbanization is highly related to many alternative indicators. He concluded that "Urbanization is an intrinsic part of modernization in general." (See Schnore, "The Statistical Measurement of Urbanization and Economic Development," *Land Economics*, 38, 1961. I found, using Mexican data, that a variety of independent variables are all intercorrelated averaging .80.) Third, data for some alternative indicators, like GNP, is unavailable. As to the use of absolute levels rather than rates of change, we rely partly on Raymond Tanter's argument: "Although most of the hypotheses above are stated temporally, implying the need for a change measure of urbanization, empirical research suggests that the level and rate of urbanization operate similarly vis-à-vis other processes such as measures of social mobilization." Raymond Tanter, "Toward a Theory of Conflict Behavior in Latin America," (University of Michigan, unpublished paper, 1967), p. 8. Although I believe that the "true" causal variable is a composite of many indicators of level of de-

velopment, the variable will hereafter be specified as "urbanization."

²⁴ James Wilkie, *The Mexican Revolution* (Berkeley: University of California Press, 1967), pp. 218-219. A square root transformation was performed on the variable.

²⁵ Scott, *op. cit.*, p. 41.

²⁶ *Ibid.*, p. 40.

²⁷ *Ibid.*, p. 39.

²⁸ Since historical nonintegration has no easily measurable attributes, a rough test of the hypotheses could be made by testing the adequacy of the model without the variable. Such a procedure, however, fails to reveal interactions between this variable and other variables in the model. My procedure instead will be to construct a dichotomous (dummy) variable which will be allowed to enter the equations freely. Hence I coded Oaxaca, Yucatán, Baja California (Norte) and Baja California Territory as "1" and all the other states as "0" for this variable.

other national units. The political environment of states along the United States-Mexico border surely differs from that of states bordering only on Mexican states; hence, it is not surprising that politics in these states should be affected by proximity to the United States.

In their study of the border cities of El Paso, Texas, and Ciudad Juarez, Chihuahua, D'Antonio and Form discuss the effects of proximity to a large Texas city. They suggest that:

the long common history of the two cities may have produced an overriding border culture which contained certain structural ambiguities and anomalies not ordinarily found in cities clearly embedded in a distinct culture.²⁹

The effects of living close to the United States are particularly strong on Mexican influentials:

To the Mexican influentials, especially the businessmen, the border represented more than economic opportunity . . . they looked to the United States as a source of values, ideas, and ideals. A majority had studied in American schools, learned English, observed how the American system worked, and made some strong friends in the States.³⁰

The *PRI* faced considerable opposition in Juarez during the 1950's from the *PAN*. The strength of the opposition seemed based on the vigorous associational interest groups dominated by business influentials. Such interest groups paralleled similar groups in El Paso. Businessmen's images of the political and economic system of El Paso may have helped invigorate associational interest groups and legitimize opposition. Therefore I hypothesize that states bordering on the United States will have higher levels of participation and lower levels of *PRI* vote.³¹

Structure of Opposition. It might be argued that the use of *PRI* vote as the dependent variable implies that Mexico has a two-party system; i.e., the *PRI* versus all other parties. Though opposition parties on the left and on the right draw voters from different sectors of the electorate and have different significance for the *PRI* leaders, I suggest that lumping together all oppositions is justified as long as explanations are directed to conditions favorable to high *PRI* votes rather than to conditions favorable to high opposition votes.

²⁹ D'Antonio and Form, *op. cit.*, p. 218.

³⁰ *Ibid.*, p. 219.

³¹ Six states border on the United States: Baja California, Sonora, Chihuahua, Coahila, Nuevo Leon, and Tamaulipas. Using the same technique as with the previous variable, these states are coded "1", all other states are coded "0".

Although the above position is defensible, at this point certain aspects of the opposition are related to the *PRI* vote. In particular, I am interested in discovering a relationship between the number of parties in opposition to the *PRI* and turnout and direction of vote. In Presidential elections usually only the *PRI* and the *PAN* put up candidates, but in off-year elections there may be as many as four minor parties running candidates for the Chamber of Deputies. Since these parties would probably not put up candidates if there were no potential voters, their presence ought to have the effect of increasing turnout—though perhaps only slightly, since the majority of their voters could be people who are drawn from the established parties.

The effect of oppositions on the direction of the vote is less clear. Splinter parties may attract persons who were previously nonvoters; thereby reducing the *PRI* percentage. But these minor parties might direct attacks against each other rather than against the *PRI*. In addition, the fragmentation of the opposition might confuse potentially anti-*PRI* voters and result in withdrawal. These latter possibilities would increase the *PRI* percentage. Predicting the net effect of these counter-trends is impossible without more information about the parties, so this link will be left unspecified.³²

Other Possible Variables. My selection of variables has been determined partly by theoretical relevance and partly by data availability. There are a variety of other indirect factors of obvious relevance; hence, this discussion is not meant to imply theoretical closure.³³

Direct Factors

Party Activity. The most natural means by which a party can influence an election are the myriad activities falling under the general rubric of "party activity." In Mexico these might include rallies, get-out-the-vote drives, propaganda, canvassing, etc. Unfortunately, none of these variables can be quantified given the present state of knowledge about Mexican poli-

³² This variable has been operationalized by counting all non-*PRI* parties that received any votes in 1955, 1961, and 1967, and summing the three totals. The scores range from three to ten. A square root transformation was performed on this data.

³³ Among other useful measures: economic conditions at the time of the election, especially cost-of-living indices and unemployment rates; climatic conditions on election day; and what some American scholars euphemistically call "Deaths from civil violence;" i.e., dead students. Quantification of these variables requires more data.

tics. Hence, this study has no measures of party activity; the following variable definitely should not be construed as such a measure.

Affiliated Party Members. Rigorous interpretations of party membership are slippery because of the variable nature of formal membership. Although certain groups (like the military) cannot formally organize within the party, anyone may join. In addition, members of certain occupations are automatically counted as *PRI* members. For example, in a study of Xalapa, the capital of Veracruz, William Tuohy found that the *PRI*'s published membership figure was equal to about 75 percent of the adult population. Tuohy explains this exaggeration by noting that all government employees and union members were counted as well as some persons below voting age. Of the reported total, only a few paid dues and actively participated. A sample survey in the same community found that about five percent of the adult population reported being *PRI* members.³⁴

What are the effects of high percentages of the population (inflated or not) affiliated with the *PRI*? Party members may be the basis of party activities; i.e., there may be a high correlation between *PRI* membership in a state and total party activity in the state. *PRI* members may also increase turnout and vote by encouraging non-members to participate. Perhaps their major influence is on their own vote. As a result of being enmeshed in the *PRI* communications network, or because the same predisposition that led to joining the party leads toward a *PRI* vote, members may vote for the *PRI* more often than non-members in similar age and socio-economic groups. Given the level of analysis of our data, accepting any of these competing explanations would risk the ecological fallacy, but we can predict that turnout and *PRI* vote will be higher in states with high percentages of the population affiliated with the *PRI*.³⁵

Benefits and PRI Organization. The suggestion that governments may use their distributive capability to increase popular support is hardly novel. Particularly when the government also has a considerable symbolic capability

(manifested in Mexico, for example, in the association of the party and the Revolutionary Ideology, and disseminated by government-dominated media), it may try to direct affective response to an expenditure such as a new school into a large affirmative vote for the regime. And while such benefits may have long-run destabilizing effects resulting from their contribution to a state's level of development, their short-run effect is likely to be positive for the *PRI*.

To assume, however, that the impact of governmental benefits can be assessed by considering only their effects on the recipients, and to assume that such benefits are both perceived and rewarded by the voters, would be considerable oversimplification. Mediating between the outputs of the national government and the individual citizen is the local or state *PRI* organization. This mediating position stems from two considerations. First, the impact of governmental expenditures may be much greater on the organization than on the citizen, because the party is more likely to be aware of governmental benefits than the citizen, and because the citizen may become aware of the benefits only through the party. Second, an organization so strengthened by the government may be better able to mobilize the electorate in succeeding elections.

The simple benefits-citizens link may have partial validity, but we can suggest a variety of more complicated linkages which include the *PRI* organization as mediator. For example, strong state *PRI* organizations (or state strongmen) may be able to force the national government to supply benefits to the people of a state, who then respond by rewarding the government in national elections and by supporting the state organization electorally, financially, and obediently. The strengthened state organization is then better able to mobilize the electorate, further increasing support, and also to wrest more benefits from the national government. In this case the populace is made aware of the benefits by the state party, which endeavors to present them with a "courtesy of your friendly state *PRI* organization" sign.

The outputs of the national government may be imperceptible to the population but may still have an effect. If their distribution is controlled by the state organization, benefits may be translated into jobs in or dependent upon the party. This strengthens the organization and once again improves its ability to mobilize the population to turn out and support the *PRI*.

In order to frame hypotheses specifying the direction and size of government benefits, we first must consider possible allocation policies for the national government in relation to state *PRI* organizations of differing strength. Here

³⁴ William Tuohy, "Institutionalized Revolution in a Mexican City: Political Decision-Making in Xalapa," unpublished Ph.D. dissertation, Stanford University, (August, 1967), p. 27. The sample survey was conducted by Professor Richard Fagen of Stanford University.

³⁵ Gonzalez-Casanova, *op. cit.*, p. 238. A logarithmic transformation was performed. The number of officially reported *PRI* members was available only for 1962. Census data was arithmetically extrapolated to give a population base.

the problem of measuring the strength of the state organization arises. It seems impossible to find any measure that is not based either on the electoral success of the party or on its membership. Electoral success is our dependent variable; the same variable cannot be both the means and the end of our explanation unless we have a time-series analysis. And there are other aspects of organizational strength besides electoral success in a dominant-party system, such as control over participation channels.

In the case of membership, we know that the *PRI* figures are exaggerated; moreover, the number of party members, like electoral success, is not a good indicator of the strength of the organization. (Party membership is utilized as a variable elsewhere in this analysis not as an indicator of party strength but because the number of *PRI* members, regardless of their commitment or activity, ought to affect the *PRI* vote.)

It was finally decided not to consider party strength. In this case it seems better to admit that more research is needed than to use an untrustworthy indicator. Thus in this analysis the reality of the party organization as a mediator between the national government and the population of a state has to be ignored.³⁶

The loss of this variable in this analysis is not devastating, however, because we can still frame hypotheses on the assumption that at least some benefits are perceived by some citizens, and that the *PRI* is interested in maximizing the effects of the simple benefit-voter linkage.

Predicting the direction of the benefit-voter

³⁶ Some speculation on "rational" allocation policies is worthwhile. In a two-party system with high party discipline the members of the executive's party should receive the lion's share of patronage, because there is nothing to gain by helping opposition party members. When party discipline is weaker, as in the United States, influential opposition leaders may be wooed, but opposition members in marginal districts would only be strengthened by receiving government benefits. In a dominant-party system we would expect the strong party organizations to struggle for larger shares of outputs. But the government might find it more rational to help the weaker party organizations in order to strengthen them. The ability of the government to pursue such a strategy depends on the alternatives open to the stronger organizations. Is the national party (and hence the government) dependent on the state organizations; do the state organizations have any plausible sanctions, etc.?

link is not difficult; we expect benefits to lead to higher turnout and higher *PRI* percentages. But because the bulk of our analysis is done not with a time-series but with an average of the six elections, certain cautions are necessary. For example, if we measured benefits and electoral results in the same short time period, and if we discovered empirically that the *PRI* percentage was lower in areas receiving high benefits, it could be argued that the benefits caused disaffection and lower support for the *PRI*, or that the *PRI* is spending in areas where it is weak, but the benefits have not yet had time to be effective. This kind of problem can be solved definitely only by time-series analyses (which are briefly pursued below); it is partially alleviated by selecting a measure of benefits which predates the elections period sufficiently so that the benefits have had time to effect citizen perceptions.

Another problem with the benefit-voter hypothesis is the operationalization of the variable itself. Since we are concerned with the effects of benefits on people and with the ability of a government to manipulate such benefits, we have to consider the parameters governing population response and speculate on "rational" allocation policies for a national government desirous of maximizing its impact on people in different economic environments.

One possible assumption is that an individual's response to a school, water system, or road is directly proportional to his need for such benefits. Aggregated to the state level this means that a poorer state will reward the *PRI* more than a wealthy state for an equal level of benefits. As a rough test of this hypothesis we can compare the percentage of people in each state benefitted by drinkable water programs between 1946 and 1963 to the state's level of poverty.³⁷ If in fact the government spent its money in this manner, I would predict higher levels of turnout and *PRI* vote for states with higher benefit/poverty ratios.

The above hypothesis is based on the precarious assumption that people in all social classes are equally likely to perceive government as personally relevant, and that the only factor affecting their estimation of their needs is their objective living standards. The first assumption is certainly wrong; Almond and Verba, among others, have demonstrated cross-nationally the

³⁷ James Wilkie, *op. cit.*, p. 217, 248. I recognize that among the imperfections of this and the previous measure are the non-coincidence of the time spans. This will be part of the analysis of time-dependent problems.

relationship between high social class and perception of the relevance of government.³⁸ Perhaps poverty is irrelevant as a shaper of demands; everyone wants more government services regardless of his economic level. A "rational" national government might concentrate its benefits in states with larger populations, since (density being equal) more people would perceive the same benefit, and a large state contributes more voters in a national election. To test this reasoning we compare the percentage of the population in each state benefitted by drinkable-water programs to the state's population. If the relationship is positive, then we predict that states with high benefit/population ratios will have higher rates of turnout and larger percentages for the *PRI*.

Thus far we have discussed a hypothesis based on poverty as a response-conditioner and one which assumes that economic condition is irrelevant to response. A third possibility is that wealth may be a stimulus: i.e., that wealthier areas need and/or demand greater government attention and hence might reward the government for benefits. This kind of thinking is common in economics; Frederick Pryor, for example, lists urbanization and industrialization as variables positively affecting demand for public consumption expenditures.³⁹ Many types of benefits, such as elaborate sewage systems, are relevant only in urban areas. Hence the level of urbanization can be used as an index of the need for services, and the percentage of people receiving a benefit, in this case drinkable-water programs, is a measure of supply. If there is a positive relationship between the level of urbanization of a state and the percentage of people benefitted, then we would suggest that the government is following this strategy. The relationship between the measures of need and supply for each state indicates the degree of "favoritism" shown the state. We predict that the more a state has been favored by the *PRI*, the higher will be its turnout and *PRI* percentage.⁴⁰

In summary, the concept of benefits is operationalized by considering possible allocation policies for a government desirous of maximizing its

³⁸ Gabriel Almond and Sidney Verba, *The Civic Culture*, (Princeton: Princeton University Press, 1963).

³⁹ Frederick Pryor, *Public Expenditure in Communist and Capitalist Nations*, (Homewood: Richard Irwin, Inc., 1968), p. 54.

⁴⁰ The actual independent variables are the residuals of a regression between urbanization and the percentage of the population benefitting from drinkable-water programs.

impact in terms of electoral support. We cannot choose on "logical" grounds between the three possible expenditure patterns suggested here, because we want to discover what the Mexican government has actually done, not what it would do if its leaders read the *APSR*. Hence the usual procedure in regression studies—throwing all possible hypotheses into the computer and calling the survivors "true" and the fatalities "false"—is inadequate; first, because the theoretical system described here is far from complete; and second, because too many relationships are problematic. Only if we determine in advance what benefit allocation policy the government actually pursued will we be able to make any statements about the effects of benefits on voters.⁴¹

Thus we want to discover which of these three hypotheses—that benefits in Mexico are distributed to states with the highest levels of poverty, to those with the largest populations, or to those with the highest levels of urbanization—most nearly approximates reality. Empirically we can select between them by comparing the strength of the relationship between the measure of benefits; the percentage of the population benefitted by drinkable water programs, and the three possible attributes of states as recipients: level of poverty, population, and level of urbanization.⁴² The results are quite unambiguous. There is no relationship between benefits and the level of population; the relationship between benefits and poverty is moderate and negative, and the relationship between benefits and urbanization is strongly positive. (The Pearson coefficient between urbanization and benefits is .82.)

Hence the *PRI* distributes benefits to states with high levels of urbanization. I predict that the more a state has been favored; i.e., the greater the excess of supply over demands and

⁴¹ Suppose, for example, that of our three hypotheses, one was found to be associated with an increase in *PRI* vote, one had no effect on the vote, and the third was associated with a decrease in vote. The only conclusion we could draw from such a finding is that if the government followed the first policy, its vote might have increased, but if it followed some other policy, its vote either was unaffected or dropped. These hypotheses are mutually exclusive; we cannot conclude that government policy is "a little bit of everything."

⁴² The results are the same if capital spending between 1958 and 1963 is used as the measure of benefits. The actual hypothesis testing was done by comparing the standardized slopes, or Beta coefficients.

needs, the higher will be its turnout and *PRI* vote.

At this point I have predicted relationships between each of the six independent variables and two dependent variables. Table 2 summarizes these predictions:

TABLE 2: SUMMARY OF HYPOTHESES

Independent Variables	Effect of Independent Variable on:	
	Turnout	<i>PRI</i> Percentage
Urbanization	unspecified	decrease
Historical	decrease	decrease
Nonintegration		
Presence on USA Border	increase	decrease
Structure of Opposition	increase	unspecified
Party Membership	increase	increase
Benefits	increase	increase
Turnout	—	unspecified

Of course, these variables are not independent of each other, and to begin talking about causality they must be interrelated to separate the inde-

pendent effect of each from those that are purely spurious. A possible schematic representation of the model is shown in Figure 1.⁴³

V. ANALYSIS

We have thus far developed two sets of prediction equations: one in which turnout is the dependent variable, and a second in which turnout is an independent variable and the *PRI* percentage of the vote is the dependent variable. These hypotheses can be evaluated with multiple regression analyses, enabling us to simultaneously assess the contribution to the dependent variable made by each of our independent variables; i.e., the extent to which unit changes in each of the independent variables are related to unit changes in the dependent variables.⁴⁴

⁴³In this diagram all possible arrows are included. The signs refer to the direction of the predicted relationships. Double signs refer to directions that are uncertain. Circled intersections between the direct and non-direct factors indicate that the effect of each direct factor is measured controlling for all non-direct factors.

⁴⁴The correlation matrix refers to the following variables:

1. The percentage of the population living in communities over 2500.

FIGURE 1: A Schematic Representation of the Model

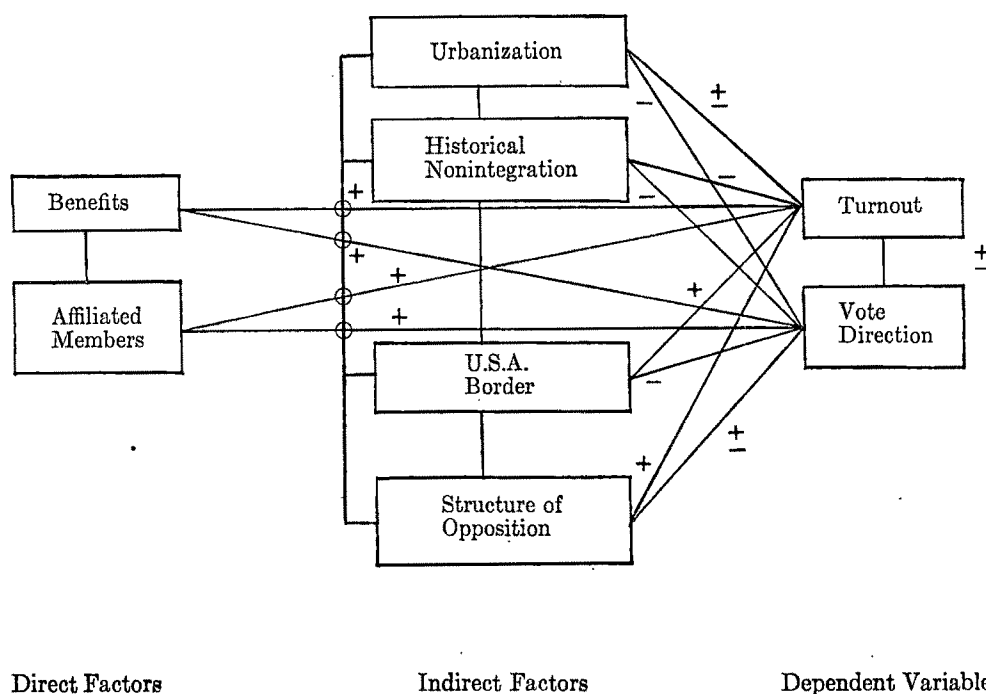

Table 3 presents the standardized regression coefficients associated with each variable in the two models. The coefficients are statistically comparable so that the relative contribution of each variable can be assessed. (For example, if one coefficient is twice the size of another, the first has twice the explanatory "weight" of the second.) The strength of the variables taken together can be measured by the coefficient of determination (R^2), which measures the percentage of the total variance explained by the independent variables.⁴⁵

A number of general substantive conclusions can be drawn from the multiple regression. The model predicting the direction of vote is extremely successful, explaining 75 percent of the variance in the *PRI* percentage. The relatively poor showing of the turnout model is not surprising: it has fewer independent variables, our theoretical underpinning is somewhat shaky, and

2. A history of nonintegration and separatism in a state.
3. Location of state on border with United States.
4. The number of opposition parties in elections for Congress.
5. The percentage of the population affiliated with the *PRI*.
6. The percentage of the population benefitted by drinkable-water programs.
7. The favoritism of a state over its level of demands for benefits.
8. The percentage of probable electors voting in six elections.
9. The percentage of the vote received by the *PRI* in six elections, 1952-67.

	1	2	3	4	5	6	7	8	9
1	—	-.02	.44	.15	.28	.82	.00**	-.12	-.69
2		—	.02	.01	-.03	.00	.03	.31	-.14
3			—	.02	.13	.46	.17	-.13	-.29
4				—	-.50	.12	.00	-.39	-.53

6						—	.57	-.11	-.65
7							—	-.03	-.15
8								—	-.38
9									—

** The lack of correlation between urbanization and the measure of favoritism does not mean that more urban states are not really getting more than rural states, but only that the relationship is linear; i.e., the tendency in favor of urban areas does not increase with urbanization.

⁴⁵ Levels of significance are not being used to test hypotheses in this paper but only to indicate the strength of relationships, because we have a universe of all cases rather than a sample. No relationships are assumed to occur by chance; both weak and strong correlations are theoretically significant. The computational analysis was done on the IBM 360/67 with the Stanford Statistical Package for the Social Sciences.

we lack any reliable measure of party activity. The most significant factor in explaining *PRI* vote is urbanization. Low levels of urbanization are associated with high *PRI* percentage. Evidently Zolberg, Ridker, and Olson, *et al.*, are correct in arguing that oppositions flourish under conditions of high social mobilization; the degree of control exerted by local *caciques* is sufficient to bring out a large *PRI* vote. Figure 2 shows the relationship between urbanization and *PRI* vote for the 32 Mexican states.

The second most important variable is the structure of the opposition. Operationalized as the number of opposition parties, it is associated with low *PRI* vote and also low turnout. Two explanations can be given for each phenomenon. Fragmentation of opposition may occur in areas where the *PRI* vote and turnout are lowest, because potential oppositions perceive a receptive public for their efforts. Fragmentation may also have the effect of causing *PRI* vote and turnout to decline through the kinds of causal chains discussed earlier; i.e., urbanization leading to new oppositions leading to defeats for the *PRI*.

I originally suggested that a large number of opposition parties would increase turnout, because each opposition party would have its own clientele. Perhaps the error in this reasoning was an overestimation of the salience of party to Mexican voters. New splinter parties may have no clientele of their own; they may draw voters from the major parties but appeal very little to non-voters.

TABLE 3: STANDARDIZED MULTIPLE REGRESSION COEFFICIENTS ASSOCIATED WITH TURNOUT AND DIRECTION OF VOTE

Coefficient of Determination	.282	.774

* Significant at the .10 level.

** Significant at the .05 level.

Percentage of Votes for the PRI

The two remaining indirect factors were entered as dichotomous variables. The effect of presence on the US border is nil. Since the border states are highly urbanized, it might be thought that the effects of presence on the US border are masked by the more powerful variable of urbanization. However an analysis of residuals (produced from a regression without this variable) shows that four of the six states on the US border have *higher* actual *PRI* vote than would be predicted by their level of urbanization. Thus, although the demonstration effect of the United States may carry over into the border cities, it does not significantly affect the total vote of the state.

I found that a condition of historical nonintegration lowered the *PRI* vote but increased turnout. The first finding was expected, but the latter is surprising. It may be that oppositions based on localist sentiment are more salient to peripheral participants than those based on ideology; and hence oppositions in the separatist areas stimulate turnout while those in integrated areas depress it. Obviously further research is needed here.

The two direct factors proved weak. In the case of party members the best explanation is probably that the method of determining membership is totally unrelated to party activity. In the case of the measure of benefits it is difficult to reach any conclusion. One possibility is that voters punish but do not reward; i.e., if the level of benefits is above their demand level (as measured by urbanization) they either might not notice the bonus, or might consider it as their due, especially because the need for government services in underdeveloped countries seems infinite. A second possibility is that water programs are a bad measure of benefits. This is suggested by the fact that the states of Michoacán, Puebla and Veracruz are all relatively disfavored. These are the home states of Lázaro Cárdenas, Avila Camacho, and both Alemán and Ruiz Cortines, all former Mexican Presidents. Probably a measure of benefits that includes more types of outputs would not show these states as disfavored. A third possibility is that measurement of the effects of such spending requires disaggregation of the six elections. This will be considered in the next section.

Turnout, the measure of participation, was positively and significantly related to *PRI* vote, supporting our contention that newly politicized voters respond to the *PRI* as the most powerful stimulus. Urbanization is unrelated to turnout. This link may be operable through the mediating effects of a valid indicator of party activity, or it may be that both hypothetically causal forces are at work. In the urban areas turnout is

pushed by the kind of spontaneous forces discussed by Lerner. In rural areas, the *PRI* can overcome lack of information and education by working through local *caciques*. Hence the level of turnout could be independent of urbanization even though both forces are operative.⁴⁶

VI. TIME-SERIES ANALYSES

One purpose of this study is to clarify changes in support for the *PRI* during the elections studied. The introduction posed certain questions answerable only with a trend or disaggregated analysis. One concerns the relation between urbanization rates and *PRI* vote over time; another concerns the relationship between benefits and *PRI* vote. However the dependent variable is operationalized several conclusions are relevant.⁴⁷

First, despite the increasing level of urbanization of Mexico, the *PRI* has become more rather than less dominant. Between 1952 and 1967 the percentage *PRI* rose in every state but three. The average increase was more than eleven percent.

Second, those states with the lowest *PRI* vote in 1952 made the largest gains. Whereas in 1952 twelve states voted less than 75 percent for the *PRI*, in 1967 only two states were below this level. The fact that the lowest states increase most is of course partly a statistical phenomenon, since a state with a *PRI* percentage of 97 in 1952 cannot increase by much in 1967.

Third, correlational analysis is not very helpful in explaining the varied increases in states' *PRI* votes. Regardless of which of the possible dependent variables we use, the correlational analysis simply tells us that the more urbanized developed states increased their *PRI* percentage more than the rural states which were always high-*PRI*.

Can we reconcile the levels-of-urbanization hypothesis with the trend in *PRI* vote? We might argue as follows: if there are variables outside the model causing a net gain in *PRI*

⁴⁶ One of the interesting problems to be explored in the future concerns the interrelationships between turnout, opposition voting, and government outcomes from election to election. This problem has been treated in the United States by, among others, Walter Dean Burnham, "The Changing Shape of the American Political Universe," this REVIEW, LIX (March, 1965), and Angus Campbell, "Surge and Decline: A Study of Electoral Change," *Public Opinion Quarterly*, 24 (1960).

⁴⁷ For example, the percentage gain from 1952 to 1967, the gain from 1955 to 1967, or the algebraic sum of changes in rank order between 1952 and 1967.

vote, those states urbanizing fastest should be gaining relatively less. But in analyzing urbanization rates and changes in *PRI* vote over time, I found no evidence that rapidly urbanizing states are becoming less strong for the *PRI*.

The second time-related problem concerns the causal effects of benefits on *PRI* vote rather than the cross-sectional association. I suggested earlier that benefits were going into low-*PRI* states. This is evident in the following table, which relates *PRI* vote in 1958 (beginning the period covered by benefits data) to the benefit level, 1959-63:⁴⁸

TABLE 4: 1958 *PRI* VOTE IN RELATION TO BENEFITS

	States above mean vote	States below mean vote
Ratio of investment to poverty characteristics in succeeding period		
Above median	7	9
Below median	12	4

Of the thirteen states whose *PRI* vote was below the national mean in 1958, nine received benefits in a ratio above the national median between 1958 and 1964. Table 5 shows the changes in *PRI* percentage in three election periods for these thirteen states. Between the 1958

TABLE 5: CHANGES IN PERCENTAGE *PRI* AMONG STATES WITH *PRI* VOTE BELOW MEAN IN 1958

	Benefits 1959-63	1955-58	1958-64	1964-67
Ratio above median	-6%	+6.4%	-2%	
Ratio below median	-4%	-2.5%	-2%	

and 1964 Presidential elections, the nine of these thirteen states receiving benefits above the national median *increased* their *PRI* vote 6.4 percent. The four states receiving benefits below the median *decreased* 2.5 percent. We can see that even among the below-mean *PRI* states in 1958, those receiving benefits in a high ratio to poverty levels were those who had done most poorly in *PRI* percentage change between 1955 and 1958. Although they made remarkable im-

provements between 1958 and 1964, in the most recent election no differences were evident.

The difficulty with this kind of analysis is obvious. We have little knowledge of the time lag involved in the benefits→votes relationship. The relationships shown here are based on very few cases. The Mexican data is suggestive of a linkage between investment and affective response, but it is definitely not conclusive.

The most significant of these time-dependent problems is the apparent paradox of a model predicting low *PRI* vote in the most modernized states, and the evidence that the greatest *PRI* gains are made in these same states. Such a phenomenon is not uncommon; for example, social mobilization and military intervention are negatively related in Latin America, but in the aggregate, both mobilization and military intervention are rising.

It is also true that variables whose effects cannot be measured here may have a substantial effect on the changes in *PRI* vote over time. One possible variable is migration: the movement of people to urban areas implies a shift of voters with a high likelihood of a *PRI* vote into low-*PRI* areas. Although urban experience might eventually decrease the *PRI* vote of immigrants, their aggregate vote is slightly more strongly *PRI* than that of long-term residents.⁴⁹

Although it is generally beyond the scope of this paper to consider the reason for the *PRI*'s continuing dominance of elections, some speculation is appropriate. One important factor is the economic success of Mexico during this period. The *PRI* is a likely beneficiary in the short run from Mexico's prosperity. A second possibility is the skill of *PRI* leadership in responding to outcries from the citizenry. If one of the major sources of anti-*PRI* movements is the dislike of corrupt and inefficient officials rather than programmatic or ideological disagreements, then the *PRI* would be strengthened by replacing such officials and increasing its use of achievement criteria. Another significant variable may be the character of the opposition, especially their feelings of efficacy in the electoral arena. The demoralizing effects of an inability to achieve even minimal electoral successes may strengthen the *PRI* even while other factors weaken its electoral position.

VII. SUMMARY AND IMPLICATIONS

I presented a series of hypotheses concerning the bases of *PRI* support. The data indicate that

⁴⁸ Cornelius, *op. cit.*, found that in 1958, 9 percent of urban-born people in urban areas voted for opposition parties, while only 3 percent of migrants into urban areas did so.

⁴⁹ The median benefit ratio was used because the Federal District (Mexico City) had a score almost five times as high as the next highest unit. Capital spending figures are being used instead of water programs because of correspondence between their time period and the elections.

about 75 percent of the variance in the *PRI* percentage in these six elections can be explained by four variables: level of urbanization, turnout, the structure of the opposition, and historical nonintegration. The original hypotheses now take on the following form:

1. The higher the level of development (as measured by urbanization or other indicators) the less will be the *PRI* percentage. Turnout is unaffected by the level of development.

2. High rates of electoral participation are associated with high *PRI* percentage.

3. A condition of historical nonintegration is associated with lower levels of *PRI* vote and higher levels of turnout.

4. Turnout and vote are unaffected by presence on the US border.

5. The percentage of vote received by the *PRI* and the level of turnout are lower when there are more opposition parties.

6. The percentage of the population affiliated with the *PRI* does not affect either turnout or direction of vote.

7. Federal spending tends to be highest in low-*PRI* states and may increase *PRI* vote levels in the short-run.

To discuss the implications of these findings we must confront the fact that the *PRI* increased its support almost everywhere, while the conclusion flowing naturally from our model is that increasing development in Mexico should lessen dominance of the *PRI*. In fact, the most

developed areas made the greatest gains between 1952 and 1967.

An easy way out of this dilemma would be the argument that the *PRI* may increase its support in the short run but in time will lose its predominant status. There is, however, no support for such a conclusion in these data. In fact, if Mexico continues to enjoy prosperity, and if the *PRI* continues to replace the worst of its officials, it may become even more powerful in the next few elections. Even the gradual shift from a subject-parochial political culture to a subject-participant one will not weaken the *PRI*, since the evidence presented here shows that a kind of "demonstration effect" operates to bring the *PRI* a higher vote when turnout and registration rise.⁵⁰ The dominance of the *PRI* may be threatened by economic recession or insufficient responsive capability, but these developments have certainly not yet occurred.

⁵⁰ Almond and Verba, *op. cit.*, p. 17-26. A parochial political culture implies a low frequency of orientations toward the political system in such areas as inputs, outputs, participation, the "system" as a general object, etc.: "In a subject political culture, there is a high frequency of orientations toward a differentiated political system and toward the output aspects of the system, but orientations toward specifically input objects, and toward the self as an active participant, approach zero . . . In a participant culture, members are oriented to both the input and output sides of the system."

THE ELECTORAL SYSTEM OF CANADA*

DUFF SPAFFORD

University of Saskatchewan

The working of the electoral system in Canada is investigated in this paper. The object is to identify the more important factors which go to determine the share of seats in the federal House of Commons won by a political party at a general election. Factors considered are share of vote, distribution of the vote and number of candidates in the field. The responsiveness of share of seats to variations in these factors is estimated by fitting linear equations by least squares to data for the fourteen federal general elections which took place in Canada between 1921 and 1965.

I. THE REPRESENTATION FUNCTION

The single-member-constituency system of election has cast up some rather puzzling results in Canada. Exhibited in Table 1 are shares of seats and shares of vote won by the parties contesting the general elections of 1930 and 1935. Two things stand out from the results. The first is that the electoral system apportions seats among the parties in a far from even-handed way: the party gaining the largest proportion of the vote is generously rewarded with seats at the expense of the other parties. This tendency, it should be said, is not peculiar to Canada but is observed wherever the single-member-constituency system is used.¹ Second, the system seems to suffer from a lack of consistency. Compare the fortunes of the Liberal party in the two elections: in 1935, with a slightly reduced vote, the party won close to double the share of seats it held in 1930. Again, compare the performance of the Progressive party in 1930 with that of the Reconstruction party in 1935. There is little evidence here of a simple relationship between a party's share of seats and its share of vote.

Now there is nothing in the rules of the

* I wish to thank John C. Courtney and Peter C. Dooley for helpful criticism. Some preliminary results of this study were reported in a paper read at the annual meeting of the Canadian Political Science Association in 1967.

¹ See Maurice Duverger, *Political Parties: Their Organization and Activity in the Modern State* (London, 1954), esp. pp. 373-4; and Douglas W. Rae, *The Political Consequences of Electoral Laws* (New Haven, 1967).

TABLE 1. RESULTS OF GENERAL ELECTIONS
IN CANADA, 1930 AND 1935

Source: Howard A. Scarrow, *Canada Votes*, (New Orleans, 1962), Tables 24 and 28.

single-member-constituency system of election to ensure that a party's share of seats will be related in a predictable way to its share of vote. In a two-party system, a party winning 40 per cent of the vote might win anything from nil to close to 80 per cent of the seats, depending on how the vote is distributed among the constituencies; with more than two parties, the range of possible outcomes is even greater. In fact, however, share of seats does tend to be closely dependent on share of vote in single-member-constituency systems—at least outside Canada. Dahl has fitted linear equations to time-series data for Congressional elections in the United States and found that more than nine-tenths of the variance of share of seats was capable of explanation by the behavior of share of vote.² In Great Britain, the so-called "cube law," which states that the proportion which party A's share of seats bears to party B's will vary as the cube of the proportion of A's share of vote to B's, has yielded quite accurate predictions of election outcomes. The implied relationship between share of seats and share of vote is non-linear. The rationale of the cube law has been investigated by the British statisticians Kendall and Stuart, who discovered that the construct rested on certain conditions governing the distribution of the proportions of vote won by a party in the

² Robert A. Dahl, *A Preface to Democratic Theory* (Chicago, 1956), pp. 148-9. Dahl regresses Democratic share of *major-party* seats on that party's share of *major-party* vote.

constituencies.³ The conditions were found to be approximately satisfied in Great Britain.

In Canada, neither the linear nor the cube-law hypothesis offers a convincing account of election outcomes. For the major (Liberal and Conservative) parties over the period from 1921 to 1965, no more than about three-quarters of the variance of share of seats can be explained by changes in share of vote, assuming linearity. The cube law, in its original (two-party) form, performs no better.⁴ Considering that Canada is a multi-party system, the inapplicability of the cube law is not surprising. The mechanics of the cube law require, among other things, that the proportion of the vote needed to win a contest be one-half. In a three- or four-party system, a contest can be won with a good deal less than one-half of the vote, and the required proportion generally cannot be specified *a priori*.

There are, of course, many other forms of the relationship between a party's share of vote and its share of seats which might be canvassed. It seems unlikely, however, that the problem of explaining election outcomes in Canada is wholly or even largely one of discovering the correct functional form of a two-variable relationship. What does seem likely is that there are factors other than share of vote which play a part in the determination of election outcomes. To elicit the influence of these factors a multivariate analysis must be undertaken.

We begin by positing the dependence of the i th party's share of seats S_i on its share of vote V_i , K variables X_1, \dots, X_k , and a variable u :

$$S_i = f(V_i; X_1, \dots, X_k; u)$$

It is convenient to have a name for this relation, and "representation function" seems apt. The variables X_1, \dots, X_k are as yet unspecified factors which, along with V_i , exert

systematic influences on S_i . The remaining variable, u , is an error term whose inclusion acknowledges the possibility of inexactness arising from incomplete specification, data errors and random disturbances. The expected value of u is assumed to be zero.

Two kinds of decisions must be made in the course of specifying the representation function. First, the form of the dependence of S_i on the independent variables has to be decided upon. We adopt the assumption of linear form, principally because of its simplicity. (Something more will be said about this assumption later on.) Second, the variables X_1, \dots, X_k must be specified. Variables considered are numbers of candidates placed in the field by the several parties and an aspect of the distribution of the parties' vote among the constituencies. We discuss now the ways in which these variables may be supposed to figure in the representation function.

Number of candidates. The number of candidates presenting themselves for election has varied a great deal in recent Canadian experience. The major parties usually have contested all or almost all constituencies, though in several elections they named no candidates in many. The number of other ("minor-party") candidates has varied from fewer than one hundred to more than five hundred.

The proportion of vote necessary for victory in a constituency can be taken to be dependent in a loose way on the number of candidates in contention. For two candidates, something more than one-half of the vote is required; for three, it might be little more than one-third (though it might be a great deal more); for four, perhaps little more than one-quarter; and so on. A party winning 40 per cent of the national vote might win relatively few seats in a two-party contest. In an election involving four parties, 40 per cent of the national vote might be enough to win a majority of seats.

It is worthwhile to inquire more closely into the way in which variations in the number of candidates affect election outcomes. Suppose there are three parties, A , B , and C ; and suppose further, for the sake of tidiness, that the voting population is fixed from election to election and everyone turns out. Each of the three parties enters a candidate in all n constituencies in election I. In a constituency J , C 's candidate finished a poor third in election I, and C does not name a candidate in J in election II. Imagine now that in the other $n-1$ constituencies the results of election II are identical in every respect with those of election I. The only changes in the system between elections I and II, then, are those following from C 's vacating J .

³ M. G. Kendall and A. Stuart, "The Law of the Cubic Proportion in Election Results," *British Journal of Sociology*, Vol. 1 (1950), 183-96.

⁴ T. H. Qualter, in a recent study, puts forward a "modified cube law" for the multi-party case and applies it to Canada. Because of differences in intent and method it is difficult to compare Qualter's results with those presented here. See T. H. Qualter, "Seats and Votes: An Application of the Cube Law to the Canadian Electoral System," *Canadian Journal of Political Science*, Vol. 1 (1968), 336-344. It may be noted that both the two-party cube law and Qualter's "modified cube law" are special cases of the "weak proportionality" function proposed by Theil. See Henri Theil, "The Desired Political Entropy," this *Review*, Vol. LXIII (June, 1969), 521-525.

By abandoning a (by hypothesis) hopeless cause in *J*, party *C* will have augmented the "efficiency" of its vote in the following sense: the party wins the same number of seats as before, but with a smaller share of the total vote. We may be permitted to infer from this that, had it won as large a share of vote in II as in I, *C* could have won more seats in II.⁶ That is, for a given share of vote, a party is predicted to win more seats when the number of constituencies it enters is reduced. There is a good deal of common sense in this prediction, which simply says that a given vote will yield more seats for a party when it is spread over fewer candidates.

Can it be taken for granted that the same reasoning applies when a party *increases* the number of constituencies it enters? There is a certain asymmetry here. It could be supposed that a party would abandon only palpably hopeless causes. One cannot suppose, however, that every new candidature is of the hopeless variety: the facts state otherwise. It remains, however, that the probability of a newcomer's winning a seat is quite small. Further, against the effects of a victory on a party's efficiency might have to be set the effects of perhaps a dozen defeats. The asymmetry must be allowed to stand, but it does not necessarily force a revision of the hypothesis that a party's efficiency will vary inversely with the number of its candidates.

We revert now to the simple model to examine the consequences for *A* and *B* of *C*'s decision not to contest *J*. Now it is clear that, because *C* wins the same number of seats with a smaller share of the vote in election II, *A* and *B* taken together must win the same number of seats with a larger share of the vote. At least one and possibly both of *A* and *B* will suffer a worsening in efficiency.

There is one case in which it can be predicted confidently that the efficiency of both *A* and *B* will be reduced. This case involves the following assumptions: (a) that, as a result of *C*'s vacating *J*, the number of votes going to each of *A* and *B* in *J* is larger; (b) that *C*'s stepping down does not cause the decision in *J* to be different. Assumption (a) seems fairly plausible even though arguable. It amounts to the supposition that, in election II, some of *C*'s ad-

herents from election I days will go over to *A* and some will go over to *B*. Assumption (b) has somewhat less to recommend it. The former adherents of *C* might divide between *A* and *B* in such a way as to alter the decision. Suppose that *A* won *J* in election I but that in election II, with *C*'s candidate absent, *B* emerged the victor. The efficiency of *A*'s vote clearly will have deteriorated: the party wins a larger vote and fewer seats than before. But the effect on the efficiency of *B*, which wins a larger vote as well as more seats, is problematical. Since the assumptions represent sufficient but not necessary conditions, a worsening of *B*'s efficiency cannot be ruled out. Neither, however, can it be predicted with assurance.

In summary, our expectations take the following form. When a party reduces the number of its candidates, other things being equal, its efficiency will be improved; that is, for a given share of vote, the party will win more seats. The efficiency of at least one of its rivals must be reduced and that of all rivals might be. Effects of opposite kind can be anticipated throughout when a party increases the number of constituencies entered.

In the empirical work to follow, the number of candidates placed in the field by the *i*th party is denoted by N_i . For ease of interpretation of the coefficients N_i is expressed on the basis of an electoral system comprising 265 constituencies. (The actual number of seats varied over the 1921-65 period from 235 to 265.)

Distribution of the Vote. The share of seats won by a party will depend critically on the way in which its vote is distributed among the constituencies. The handling of distributional factors in an aggregative analysis is, it must be conceded, an awkward matter. Further, where more than two parties contend, as in Canada, such factors can be highly complex. There is, however, at least one aspect of the distribution of the vote which can be incorporated into the present analysis.

In Canada, at least until the most recent (1966) redistribution, substantial variation in the populations of constituencies has been permitted. Constituency populations have tended, moreover, to vary along a dimension which is relevant to the determination of voters' party preferences. Rural constituencies generally have contained fewer voters than urban constituencies. Because a rural seat contains fewer voters, it can be won with a smaller proportion of the *national* vote than is required to win an urban seat, other things being equal. Thus, the share of vote required to win a given share of seats might be relatively small if the vote is concentrated in small rural constitu-

⁶ The inference would be fully justified if the representation function were continuous and monotonic increasing. Obviously this requirement is not met in fact: the addition of a handful of votes to a party's total will not always result in additional seats won. It is sufficient for present purposes to assume that the probability of a party's winning an additional seat with a modest augmentation of its vote is not zero.

encies. It will be convenient to state the hypothesis in an alternative form: a party will win more (fewer) seats for a given share of vote, other things being equal, the greater its relative strength in small (large) constituencies.

To test this hypothesis it is necessary to devise an index representing the relative strength of a party in size-classes of constituencies. An index, denoted by B_i , was constructed in the following way. Constituencies larger than mean size (according to the number of votes cast) were identified, and the aggregate share of vote cast in favor of the i th party in those constituencies calculated. This large-constituency share was then divided by V_i , the share of the vote received by the party over all constituencies, and the resulting quotient was multiplied by 100. An index of $B_i = 110$, for instance, would connote that the i th party's performance in large constituencies was 10 per cent better, in relative terms, than its performance in all constituencies (e.g., the party might have won 55 per cent of the aggregate vote in large constituencies and 50 per cent of the aggregate vote nationally). A value of 100 would indicate that the party did equally well in large constituencies and all constituencies. The expectation is that the share of seats won by the i th party will vary inversely with B_i , other factors held constant.

II. EMPIRICAL ESTIMATES

We turn now to the task of estimating representation functions embodying the hypotheses set out. The representation functions are estimated by fitting linear regression equations to observed values of the relevant variables. The data pertain to the fourteen elections which took place in Canada from 1921 to 1965 and are displayed in an Appendix. Candidates are divided exhaustively into three groups: Conservative, Liberal and "minor-party," the latter group being a conglomerate of all candidates who are neither Conservative nor Liberal. Symbols used to represent the variables and to identify political parties are listed below:

S_i : Share of seats (per cent) won by the i th party;

V_i : Share of vote (per cent) won by the i th party;

N_i : Number of candidates (basis 265 constituencies) placed in the field by the i th party;

B_i : Index of relative performance of the i th party in constituencies larger than mean size;

$i = C$: Subscript identifying Conservative party;

$i = L$: Subscript identifying Liberal party;

$i = M$: Subscript identifying minor parties.

Regression equations. For the Conservative party, S_C initially was regressed on the variables V_C , N_C , B_C , N_L , and N_M . It was found that the coefficient of N_L was effectively zero; seemingly, conservative share of seats has not been sensitive to changes in the number of Liberal candidates. The variable was dropped and the equation fitted again, with the outcome:⁶

$$(1) \quad S_C = 2.897^{**}V_C - 0.241^{**}N_C - 0.819^{*}B_C \\ (0.198) \quad (0.099) \quad (0.277) \\ + 0.0550^{**}N_M + 53.49 \\ (0.0098)$$

$$\bar{R}^2 = .964, \quad \text{S.E.E.} = 3.39$$

The results are, on the whole, quite gratifying. Fit is good, all coefficients can be supposed with some confidence to differ from zero, and signs capable of prior prediction are as expected. The Conservative party's share of seats is shown to vary directly with its own share of vote and with the number of minor-party candidates, and inversely with the number of its own candidates and with its relative popularity in larger-than-average constituencies, other things held constant in each case. The standard error of estimate at 3.39 (per cent of total seats) amounts to about nine seats in a 265-seat House of Commons.

A trial fitting of the representation function for the Liberal party turned up one variable (B_L) whose coefficient fell somewhat short of conventional significance levels and another (N_C) whose coefficient was patently insignificant. The latter only was discarded, and the equation became:

$$(2) \quad S_L = 3.217^{**}V_L - 0.356^{*}N_L - 0.821B_L \\ (0.303) \quad (0.146) \quad (0.598) \\ + 0.0656^{**}N_M + 62.85 \\ (0.0129)$$

$$\bar{R}^2 = .902, \quad \text{S.E.E.} = 4.97$$

⁶ Shown in parentheses below the sample coefficients are the corresponding standard errors; \bar{R}^2 is the coefficient of determination corrected for degrees of freedom; S.E.E. is the standard error of estimate. Asterisks raised above the coefficients indicate significance level according to a two-tailed t-test, as follows: **significant at the .01 level; *significant at the .05 level. A useful and relatively non-technical introduction to regression analysis is Mordecai Ezekiel and Karl A. Fox, *Methods of Correlation and Regression Analysis* (New York, 3rd ed., 1959).

Again, signs are as expected, although the coefficient of B_L is not significant. With \bar{R}^2 of .902 the fit of the equation is somewhat less close than that of the Conservative equation.

A rather different specification was adopted for the minor-party equation. It did not seem appropriate in the case of such a conglomerate to use an index of relative strength in constituencies of different sizes. Also, when V_M , N_M , N_C , and N_L were entered together as explanatory variables, a severe problem of collinearity arose. Minor-party share of vote is highly dependent on the number of candidates placed in the field by the several parties, and the consequent redundancy of information when the variables are entered in each other's presence makes it difficult to obtain reliable estimates of the coefficients.⁷ If an estimate was to be made at all, it seemed necessary to jettison one or more of the variables. Unfortunately, all would appear to belong in the representation function, and dropping variables might be merely to exchange one source of unreliability for another. We might suppose, however, that, whatever other variables are relevant, V_M and N_M ought to figure in the equation.

$$(3) \quad S_M = 1.237^{**}V_M - 0.0360^{**}N_M + 0.99$$

(0.233) (0.0117)

$$\bar{R}^2 = .718, \quad \text{S.E.E.} = 3.47$$

Both coefficients are significant and the \bar{R}^2 is of a respectable order. However, the arbitrariness of this specification becomes evident when N_M is replaced by N_L . The fit of this equation (not shown) is as close as that of (3), and the coefficient of N_L turns out to be highly significant and *negative*. Replacing N_L in turn by N_C , the latter's coefficient also bears a negative sign though it is not significant. The negative signs persist through all configurations of variables. There are indications here that when a major party withdraws from contests the efficiency of the minor-party vote is *improved*, which in turn suggests that commonly such contests are won by minor-party candidates.⁸ The tactics of multi-party politics

⁷ For a succinct discussion of this problem consult H. M. Blalock, Jr., "Correlated Independent Variables: the Problem of Multicollinearity", *Social Forces*, Vol. 42 (1963), 233-237.

⁸ It seems clear that the minor parties have, on the whole, performed better when they were unopposed by one of the major parties, though the results are mixed. In the election of 1921, for example, the Liberal party did not name candidates in 33 constituencies, and in 28 of them minor-party candidates were successful; the Con-

servative party passed up 27 seats, of which only five were won by minor-party candidates.

no doubt figure in this phenomenon. A major party might withdraw from a contest with the hope of delivering the constituency into minor-party hands and thwarting the ambitions of the other major party; or, recognizing that a minor-party candidate will win in any case, the major party might withdraw as a gesture of appeasement. The matter is, perhaps, of more historical than current interest, since in the last half-dozen elections the major parties have fielded complete slates of candidates with only a few exceptions.

The empirical estimates establish the importance of several factors in the working of the electoral system in Canada. In the case of the Conservative party, as many as four variables are shown to contribute significantly to the explanation of share of seats won; in the case of the Liberals, three. As noted, share of vote alone is able to account for only about three-quarters of the variance of share of seats won by a major party. The addition of numbers-of-candidates variables and an index representing one aspect of the distribution of the vote raises the proportion of variance explained to nine-tenths or higher. For the minor parties, the relevance of at least one variable besides share of vote is suggested, though because of collinearity the precise identity of the other variable or variables remains in doubt.

Some features of the system. From the coefficients estimated in equations (1)-(3) can be elicited a good deal of information concerning the working of the electoral system in Canada. We confine attention here to a few of the more important and interesting results.

The relationship which perhaps is of most interest is that between a party's share of seats and its share of vote when other factors are held constant. For the major parties, according to the coefficients of V_C and V_L in (1) and (2), a change in share of vote of one percentage point is transformed into a change in share of seats of about three percentage points in the same direction. Thus, in a House of Commons of 265 seats, an additional percentage point of vote won by a party would gain about eight seats. It is interesting that the estimated "incremental transformation rate" of 3.0 or thereabouts is quite close to the rate yielded by the cube law in Great Britain and to that estimated for Congressional elections in the United States.⁹ That three systems should exhibit a

servative party passed up 27 seats, of which only five were won by minor-party candidates.

⁹ The cube law implies a non-linear relationship between share of seats and share of vote, i.e., the incremental transformation rate is not a con-

regularity of this kind is indeed remarkable in view of the lack of formal restrictions on the transformation rate under the single-member-constituency method of election.

The transformation rate for the minor parties is substantially lower than the major-party rate. In fact, the coefficient of V_M in (3) is less than half those of V_C in (1) and V_L in (2). The minor parties are at a relative disadvantage, the most plausible explanation of which is the generally lower level of the minor-party vote.

This, however, raises a question concerning the form of the relationship between share of seats and share of vote. If, in general, the transformation rate varies with share of vote, the linearity assumption relied on thus far might not be suitable. Several rough-and-ready tests for non-linearity were carried out, and in none was its presence indicated. On the other hand, experimentation with disaggregated data, in which share of vote varied over a wide range, did turn up strong evidence of non-linearity. The following tentative explanation is offered: the underlying relationship between a party's share of seats and its share of vote is in fact non-linear; but over the limited range in which share of vote is observed in the present samples, the relationship can be closely approximated by a straight line.

When the number of minor-party candidates is increased, the share of seats won by a major party for a given own share of vote is augmented. According to equation (1), the increase in Conservative share of seats when an additional minor-party candidate enters the field is .055 per cent (of the seats in the House); equation (2) offers an estimate of .066 per cent in respect of the Liberals. There is no necessity for the two coefficients to be equal: changes in minor-party activity could have quite different effects on the two major parties. However, the two sample coefficients here are within one standard error of each other, and the inference of no difference would seem to be called for.

The dependence of major-party share of seats on the number of minor-party candidates

stant but rather varies with share of vote. However, James G. March reports that for shares of vote ranging from 40 per cent to 60 per cent the cube law can be approximated closely by a linear equation which fixes the transformation rate at about 2.8. See James G. March, "Party Legislative Representation as a Function of Election Results," *The Public Opinion Quarterly*, Vol. XXI (1957/58), 521-542. Dahl (*op. cit.*, pp. 148-149) elicited transformation rates for the Democratic party of 2.50 in House of Representatives elections and 3.02 in Senate elections.

FIGURE 1

explains the ability of parties to win majorities in the House of Commons with much less than a majority of the vote cast in their favor. Figure 1 provides an illustration, using the coefficients for the Conservative party estimated in equation (1). Measured along the horizontal axis is V_C , and along the vertical axis N_M . The slanted lines ("equal-representation lines") trace out combinations of V_C and N_M which yield stated levels of S_o .¹⁰ (It is assumed that the Conservatives contest all seats and perform equally well in large and small constituencies, i.e. $N_C=265$ and $B_C=100$). With 100 minor-party candidates in the field the Conservatives are estimated to require 47.2 per cent of the vote to win 50 per cent of the seats. Setting N_M at 200, some 45.3 per cent of the vote is needed by the major party to win 50 per cent of the seats; at 500, only 39.6 per cent. In contrast, 39.6 per cent of the vote is indicated to yield only about 28 per cent of the seats when there are as few as 100 minor-party candidates in the field.

Since the independent variables in an equation are related to a common variable S_i , they can be brought into relation with each other to answer questions of this sort: By what amount must one independent variable be changed to compensate for the effect on S_i of a given change in another independent variable?

¹⁰ The slanted (equal-representation) lines are truncated at $N_M=100$ and $N_M=500$ to remain well within the range of observed values of the variable in the sample.

TABLE 2. STANDARD REGRESSION COEFFICIENTS (BETA WEIGHTS)

Equation	V_C	V_L	V_M	N_C	N_L	N_M	B_C	B_L
(1)	1.37			-0.18		0.47	-0.22	
(2)		1.01			-0.31	0.64		-0.13
(3)			1.47			-0.85		

Source: Calculated from coefficients of Equations (1)-(3) and standard deviations of variables.

Of special interest is the way in which variations in the "other" factors compensate for gains and losses in a party's voting support.

In this connection, the slope of the equal-representation lines in Figure 1 can be given a useful interpretation. The slope indicates the rate at which V_C must be substituted for N_M to maintain constant S_C . Holding N_C and B_C constant, we can write, from equation (1),

$$\Delta S_C = 2.897 \Delta V_C + 0.055 \Delta N_M$$

where Δ stands for "change in." Along a given equal-representation line, $\Delta S_C = 0$; hence,

$$0 = 2.897 \Delta V_C + 0.055 \Delta N_M,$$

and the slope of the equal-representation line is

$$\begin{aligned} \frac{\Delta N_M}{\Delta V_C} &= - \frac{2.897}{0.055} \\ &= -52.7 \end{aligned}$$

Thus, an increase of about 53 in the number of minor-party candidates will have an effect on Conservative share of seats which just compensates for the effect of a decrease in its (the Conservative party's) share of vote of one percentage point. Put otherwise, the Conservatives can give up one per cent of the vote for every 53 additional minor-party candidates in the field and maintain a given share of seats, other factors held constant.

Substitution rates can be calculated in a similar way for V_C in substitution with the other independent variables. Taking B_C ,

$$\frac{\Delta B_C}{\Delta V_C} = 3.5$$

If there were a shift in the party's base of support towards small constituencies such that B_C fell by 3.5 (e.g., from 100 to 96.5) the party could win a given share of seats with a share of vote one percentage point smaller. Finally, for N_C ,

$$\frac{\Delta N_C}{\Delta V_C} = 12.0$$

Withdrawing 12 Conservative candidates from the field has the same effect on S_C for given V_C as an increase in V_C of one percentage point.

Substitution rates for the Liberal party, calculated from the coefficients in equation (2), are fairly similar throughout.

It would be useful, finally, to know something about the relative importance of the several independent variables in producing changes in election outcomes. As they stand, the regression coefficients do not offer a reliable basis for judging the relative importance of the variables: the size of a coefficient will reflect the (often arbitrarily-selected) units in which the independent variable is measured. For comparison to be meaningful, some standardization procedure is needed. Here we may make use of standard regression coefficients, often called Beta-weights, which show the change in the dependent variable, in own-standard deviation units, when an independent variable is changed by one own-standard deviation.¹¹ Beta-weights for the variables in equations (1)-(3) are shown in Table 2.

On the basis of the absolute values of the Beta-weights, own share of vote is the independent variable to which share of seats is most responsive in all three cases: a not unexpected result. Ranking next in importance throughout is number of minor-party candidates. We may conjecture that the seemingly eccentric changes in party standings which occur from time to time in Canadian elections are due largely to changes in the number of minor-party candidates. Reverting to the data of Table 1, it is doubtless significant that fewer than 100 minor-party candidates contested the election of 1930 while more than 400 contested that of 1935. The very substantial increase in minor-party participation in 1935 led to a correspondingly substantial increase in the efficiency of the Liberal vote.

Qualifications and a test. The empirical estimates are subject to several qualifications which ought to be recorded. First, certain specification problems which affect the interpretation of the coefficients are left unresolved. In the case of the minor parties, several formulations produced equally good fits; the major-

¹¹ See H. M. Blalock, Jr., *Social Statistics* (New York, 1960), p. 345.

party equations, fortunately, yielded less ambiguous results. The difficulties with the minor-party equation may be in part the result of lumping together all "other" candidates. Disaggregation would be desirable, but it would mean reducing the size of an already very small sample (no one third party's life spans the sample period). Second, it is possible that the estimated coefficients are biased because of the omission of relevant variables. The only way to guard against such biases is to bring all likely variables within the compass of the analysis. A few other variables were tried, but none appeared to add anything. It may be worth reporting that attempts to uncover possible effects of the periodic re-drawing of constituency boundaries (the effects assumed to be in favor of the party in power) turned up nothing. The results may reflect the method, which was distinctly unrefined. Third, a doubt concerning one of the variables must be confessed to. The index B_i is constructed from data which are subject to the influence of other explanatory variables, and its independence is open to question. The index is moderately correlated in the sample with several other variables (see correlation matrix, Appendix).

The general election which took place in Canada in 1968 offers a limited but valuable opportunity to test the capabilities of the equations. The relevant data (recorded in the Appendix) were inserted into equations (1)–(3) to produce the estimates shown in Table 3. For the Liberals and the minor parties, the equations perform very well; the estimate for the

Conservatives is not so close to the mark. The results are as good as or better than one might have expected on the basis of the standard errors of estimate in the sample period.

III. CONCLUSIONS

The most general conclusion to be drawn from the analysis is that the determination of election outcomes in Canada is a complex process in which the influences of several factors combine. By the use of regression analysis it has been possible to tentatively identify several—hopefully, the most important—variables which figure in the process. For the major parties, the variables shown to be relevant are own share of vote, number of own candidates, number of minor-party candidates and (in one case) relative strength of the major party in size-classes of constituencies. Certain problems stood in the way of a satisfactory account of minor-party share of seats, but the importance of at least one variable besides share of vote is indicated.

For the specifications adopted, the variable ranking next in importance to own share of vote is number of minor-party candidates. The greater the number of minor-party candidates in the field, the smaller the share of vote needed by a major party to attain a given share of seats, other things remaining constant. The regression coefficients provide a quantitative measure of the effect on the efficiency of the major-party vote of changes in the level of minor-party activity.

It is estimated that, for the major parties, an increase in share of vote of one percentage point will bring about an increase in share of seats of about three percentage points. This is similar to rates calculated for the two-party systems of Great Britain and the United States, but much larger than the rate estimated here for the minor parties in Canada.

In respect of method, the study offers some evidence of the potentialities of multiple regression analysis in the investigation of electoral systems. There can be few electoral systems so innocent of complexity that their working can be adequately described in a relationship between two variables, share of seats and share of vote. Other factors can—in Canada, at least, do—affect election outcomes.

TABLE 3. ESTIMATED AND ACTUAL SHARES OF SEATS, ELECTION OF 1968

Party	Estimated Share of Seats (%)	Actual Share of Seats (%)	Error (%)
Conservative	31.5	27.3	+4.2
Liberal	57.3	58.7	−1.4
Minor Parties	13.6	14.0	−0.4

Sources: S_i , V_i , 1921-1958: H. A. Scarrow, *Canada Votes* (New Orleans, 1962); 1962-1968: *Report of the Chief Electoral Officer* (Ottawa) 25th-28th general elections; N_i , B_i computed from data in above sources, as follows:

$$N_i = \frac{265n_i}{n}$$

where n_i is the number of candidates entered by the i th party and n is the total number of seats in the (forthcoming) House of Commons;

$$B_i = 100 \left(\frac{\sum v_{ij}}{\sum v_j} + V_i \right), \quad v_j > \bar{v},$$

where v_{ij} is the number of votes won by the i th party in the j th constituency and \bar{v} the mean number of votes cast in the n constituencies. Where not all constituencies were entered by the i th party, data for uncontested constituencies were deleted in the computation of the index.

Data used differ slightly in some instances from those contained in the recent compilation by J. M. Beck in *Pendulum of Power* (Scarborough, 1968), which came to my attention too late to permit use here. The differences are small, and cannot be supposed to affect the argument.

* Not used in the calculation of regression coefficients.

A NOTE ON OVERSEAS CHINESE POLITICAL PARTICIPATION IN URBAN MALAYA*

ALVIN RABUSHKA
University of Rochester

I. INTRODUCTION

The object of this note is to demonstrate that generalizations about political participation may be invalid when applied to "developing" or "transitional" societies. Specifically, the relationship between rates of voter turnout and levels of education for urban Chinese in Malaya is not consistent with results reported for Western societies.

A geographical classification of bibliographic entries in Lester Milbrath's *Political Participation*¹ discloses a very interesting statistic: only 3 of the 288 listed entries concern the transitional societies of Asia, Africa and Latin America. The lack of data on developing areas may, in large measure, explain the emphasis placed on studies of political participation in North America and Western Europe. Although there is more research on transitional societies today, most studies still focus on advanced industrial societies. The validity of the generalizations presented in *Political Participation*, therefore, is restricted to North America and Western Europe.

Using data collected in Malaya (1957), I examine four of Milbrath's hypotheses. These include:

- (1) higher education increases participation (p. 122);
- (2) middle-aged persons participate more than young or old persons (p. 134);
- (3) men are more likely to participate than women (p. 133); and
- (4) religion affects participation (p. 137).

II. METHOD

The dependent variable in each of these hypothesized relationships is participation, measured by percentage voter turnout among the population. With the exception of religion, measurement procedures need little discussion. Sex, age and education are evident. The different religions in Malaya are Buddhism, Taoism, Islam, Hinduism, and Christianity.

The data which I present were collected by

*Support was received from the National Science Foundation Grant No. GS-1361. Living expenses during field research were provided by Fulbright-Hays Fellowship No. FH 6-141.

¹(Chicago: Rand McNally & Company, 1965).

Survey Research Malaysia during February-March 1967 in Kuala Lumpur and Penang, Malaya. A two-stage sample survey was designed to select 500 households in which adults could be enumerated and selected for interview against a list of qualifying numbers. The field work produced 374 successful adult interviews in Penang and 359 in Kuala Lumpur, the two largest and commercially most important cities in Malaya. The results describe only reported Chinese voting behavior at the 1964 Parliamentary or State Legislative Assembly elections (the most recent general elections preceding the date of the survey); the number of Indians and Malays interviewed is too small to permit meaningful quantitative analysis.²

III. RESULTS

Neither sex nor religion discriminate respondents' rates of voting. The hypothesized relationship between age and participation was confirmed, i.e., voting rates increase until the middle-age category and decline thereafter. How-

² The ethnic composition of respondents in Kuala Lumpur and Penang compared with census distributions, by percentages, is displayed below. One can readily observe that Chinese predominate numerically in both cities. The number of Malays and Indians in each educational category is too small to permit a meaningful reporting of voter turnout rates for those categories.

Kuala Lumpur		
Ethnic Group	(N=359) Sample	(N=314,000) Census (1957)
Malays	13.3	15.0
Chinese	74.9	62.0
Indians	8.9	16.9
Penang		
Ethnic Group	(N=374) Sample	(N=234,000) Census (1957)
Malays	16.8	11.4
Chinese	67.4	72.9
Indians	13.9	13.6

FIGURE 1. Proportion of Voter Turnout by Level of Education

ever, when education is plotted against rates of voter turnout among Chinese in urban Malaya, an unexpected result occurs. Figure 1 reveals this surprising outcome. Figure 1 shows that participation generally declines, and significantly so, as level of education increases. This result for 261 Chinese in Kuala Lumpur and 241 in Penang is not consistent with the hypothesized relationship presented in Milbrath. That the result appears for both cities, although slightly more pronounced in Kuala Lumpur, suggests that this decreasing relationship is not due to the uniqueness of a given Malayan city, but is generally applicable to urban Chinese voting behavior in Malaya.

IV. DISCUSSION

The use of data collected in a transitional Asian society shows that the relationship between education and level of voter turnout differs from relationships previously reported in North American and Western European countries. One plausible explanation offered here is that increased levels of education among Chinese in urban Malaya lead to an awareness that one's vote is meaningless. I show elsewhere³

that Malayan Chinese have been systematically discriminated against, disfranchised or otherwise reduced to a low level of political efficacy. Briefly, that article shows that Malay members of Parliament passed a constitutional amendment which potentially increases Malay representation by reducing rural constituency size to half that of urban constituencies. This is significant because Malays comprise a majority of the rural population while the Chinese are the majority of the urban population. As a result, the Chinese are at a comparative disadvantage in State and Parliamentary elections. Furthermore, non-Malay opposition political power was eliminated by the suspension of several important Chinese controlled municipal councils on charges of malpractice by Malay dominated State governments. This argument suggests that the better educated Chinese is more likely to realize his electoral powerlessness and, hence, he is less likely to vote.

In the business of writing lawlike generalizations, one lesson is clear. Comparisons limited only to advanced industrial societies in the "West" may provide somewhat misleading conclusions. Efforts should be made to generalize on a generic phenomenon such as participation using a broader range of geographical data.

³ See "The Manipulation of Ethnic Politics in Malaya," *Polity*, forthcoming (March, 1970).

VOTING, OR A PRICE SYSTEM IN A COMPETITIVE MARKET STRUCTURE

MARTIN SHUBIK
Yale University

In this brief note it is demonstrated that if all the conditions for the existence of a competitive equilibrium are satisfied, then simple majority voting to determine the distribution of goods may be less efficient than a price system.

The argument here may be somewhat cryptic for those not familiar with the work of Anthony Downs.¹ A considerably more discursive presentation of the background material is given in "A Two Party System, General Equilibrium and the Voters' Paradox."² The tax and public goods aspect of the voting problem have been discussed elsewhere in "Notes on the Taxonomy of Problems Concerning Public Goods."³ The result presented here, nevertheless, stands by itself, hence is presented in this brief form.

¹ Anthony Downs, *An Economic Theory of Democracy* (New York: Harper & Row, 1957).

² Martin Shubik, "A Two Party System, General Equilibrium and the Voters' Paradox," *Zeitschrift für Nationalökonomie*, 28 (1968), 341-354.

³ Martin Shubik, "Notes on the Taxonomy of Problems Concerning Public Goods," (Cowles Foundation Discussion Paper 208).

The political system is modeled at its simplest. We assume the existence of two players called "political parties." The goal of each player is to win an election by as large a vote as possible. A strategy for each player is to name a policy that it will carry out if it is elected. A policy is any point in the set of feasible distributions of final product. It follows immediately that, although any policy may be considered as a strategy, any non-Pareto optimal policies are dominated by some policy that is optimal. A discussion of the reasons for modeling a party in this simple manner is given in detail elsewhere. It is assumed that all voters are passive or "mechanistic," i.e., they do not form groups but merely vote individually, selecting optimally between the two policies offered.

Consider a three-person symmetric market. The three traders have initial endowments of $(a, 0, 0)$, $(0, a, 0)$ and $(0, 0, a)$. Each has the same differentiable utility function $\phi_1 = \phi_2 = \phi_3 = \phi(x, y, z)$. It is easy to check that in this case the unique price system will be $(1, 1, 1)$ and the final imputation to each will be $(a/3, a/3, a/3)$. The worth of this imputation is shown as the point E in Figure 1.

FIGURE 1

Suppose that instead of using a price system the society decided to adopt a simple majority voting procedure for the distribution of all goods. We must specify a condition concerning the protection of property rights of the minority. For simplicity we can either assume that any taxation up to confiscation of all possessions is sanctioned, or that any redistribution must satisfy conditions of individual rationality as defined by preferences and the distribution at the *status quo ante* the vote. For the purpose of the example we assume that any taxation is possible, hence an individual can end up with nothing. As is pointed out later, the result does not depend on this.

In Figure I, s_1 , s_2 , or s_3 could be obtained by a majority. They are not preferred to each other, yet one of them is preferred to any other policy that can be named. For example, suppose that the parties limited themselves to seven programs consisting of the three policies noted and the following four others E and $((e,f,g), (g,e,f), (f,g,e)), ((f,g,e), (e,f,g), (g,e,f)), ((g,e,f), (f,g,e), (e,f,g))$ where $e+f+g=a$. Suppose that $e>f>g>0$ and $f>a/3$. The resulting 7×7 matrix game is shown below (where 1 indicates a win by one vote, 0 a tie, and -1 a loss by one vote).⁴

	1	2	3	4	5	6	7
1	0	0	0	-1	-1	1	1
2	0	0	0	-1	1	-1	1
3	0	0	0	1	-1	-1	1
4	1	1	-1	0	1	-1	1
5	1	-1	1	-1	0	1	1
6	-1	1	1	1	-1	0	1
7	-1	-1	-1	-1	-1	-1	0

This game has a mixed strategy solution of $(0,0,0,1/3,1/3,1/3,0)$ for each party. As is to be expected, each names the same (mixed) strategy and each stands the same chance of winning the election.

A possible interpretation of the mixed

⁴ Two models can be considered, the first in which a party's goal is to win by as large a vote as possible, the second where its goal is just to win. In this example, the latter assumption appears to be the more reasonable.

strategy is that the majority rule emphasizes the diversity of interests—any majority wants to benefit by taxing the minority. As this situation is symmetric, the parties wish to appear to be all things to all men at the same time; hence, they mix their strategies over different nonsymmetric outcomes favoring different interest groups.⁵

The individual consumer obtains $1/3(\phi(e,f,g) + \phi(g,e,f) + \phi(f,g,e))$ from this policy. However, if he is risk-neutral or risk-averse, then from the assumption that he has a convex set of preferences $\phi(a/3, a/3, a/3) \geq 1/3(\phi(e,f,g) + \phi(g,e,f) + \phi(f,g,e))$. This is shown as the point F in Fig. 1. If his preference set is strictly convex, then the midpoint solution that is the outcome of the competitive market is strictly preferred to the outcome obtained through the voting procedure.

Had there been a limitation on taxation, the same result would hold with the modification that some of the more extreme policies which discriminate against minorities would be limited.

The result did not depend upon selecting a finite number of policies for the two parties to offer. If all points on the optimal surface are available, then the strategic problem of the parties becomes equivalent to that of a continuous Blotto game, which has been solved by Gross and Wagner.⁶ All of the solutions place a zero probability density on the center.

It might be thought that the result depends strictly upon the symmetry of the preferences of the voters. This is not the case. If they are risk-neutral or risk-averse, then whenever the "political noncooperative game" has no pure strategy solution, the result will not be Pareto optimal. Depending on the degree of symmetry and the level of risk aversion, the competitive

⁵ Kenneth Arrow has pointed out that one must distinguish between the two cases where (1) the parties announce their (mixed) strategies to the public, or (2) randomize first and announce the results of the randomization as their policies to the public. If we adopt the first interpretation, we may view the mixed strategy as being a "degree of belief" in the mind of the voter. He perceives some of the contradictions in the statements of the parties; hence he has only a tentative view of what their actions will be. In the second instance we assume that the parties polarize the issues for the voters. In the first case we must assume a cardinal utility scale for the voters who evaluate uncertain outcomes.

⁶ O. Gross and R. Wagner, *A Continuous Blotto Game* (The RAND Corporation, RM-408, June 17, 1950).

equilibrium point will lie above the expected value of the vote in a zone of the Pareto optimal surface such that everyone is better off at the competitive equilibrium. This is shown in Figure 2. V is the expected value of the outcome obtained by voting and E the competitive equilibrium. As long as E lies between V^I and V^{II} the result is true. This diagram was drawn for ease of exposition in two dimensions where P_1 and P_2 are the evaluations of Voters 1 and 2. The picture is basically the same for higher dimensions.

A possible interpretation of the general result is that if in some sense the original distribution of resources is regarded by the voters as more or less equitable or symmetric, the economic process keeps this property; whereas the political process introduces the possibility of considerable asymmetry as the majority takes from the minority. Without special laws to protect the minority and since anyone could be in the minority, all participants evaluate the expected worth of the mix of outcomes offered by the voting process as worse than the economic outcome.

In the continuous case the policies which are not used are those which give a single individual more than two-thirds of all of the gain. A coalition of the remaining two can always be effective against such an extreme division. The midpoint or even split is also ruled out because any two players can improve their lot by taking from the third.

This model is obviously highly unrealistic and restrictive. Nevertheless, the result is possibly instructive and has a useful interpreta-

FIGURE 2

FIGURE 3

tion. The outcome is Pareto optimal, but the expected outcome is not. The loss of efficiency appears to be related to the power struggle and the inherent favoring of a nonsymmetric solution by the majority in a political situation. The economic mechanism, *given* the initial distribution of resources is anonymous and egalitarian.

It must be stressed that usually a reason for using a voting system is that no price system exists. This is almost always the case when the production of public goods is called for.

APPENDIX

One of the solutions given by Gross and Wagner is:

Colonel Blotto might do the following: He plays a continuous density function p over the regular hexagon (of Fig. 3), i.e. if $d\sigma$ denotes an element of area at point x within this hexagon, the probability that he chooses a point within $d\sigma$ is given by $p(x)d\sigma$. The density function p is determined as follows: p is constant* on the perimeter of the hexagon, zero at the center, and linear along any straight line segment joining the center with an arbitrary point on the perimeter.

* Normalization reveals the value of this constant to be $9/4\sqrt{3}$.

COMMUNICATIONS.

TO THE EDITOR:

Barrington Moore, so the editor informed me, was to be provided with the opportunity to respond to my critique with an essay up to two thirds the length of my original article. He chose to limit his comments to slightly more than seven typewritten pages and to discuss only three (four?) of the many substantive issues raised, while taking considerable space to attack my brief concluding comments as to the possible underlying assumptions of his book. The editor has allowed me 700 to 800 words to conclude this exchange. While I know that I can rely upon his generosity, I will be as succinct as possible.

Moore is disturbed by my characterization of his intellectual development. I did assume that the remarks he quotes were autobiographical. I did not, however, call him a "fellow traveller," nor did I neglect to point out that his view of the Soviet experience was as negative as his view of gradualism. (I think he ascribes the use of the term "fellow traveller" to me for quite specific reasons, which I shall return to later.) I still think my interpretation is correct, for it reinforces my memory of classes of his which I attended in the early 1950's, in which he indicated what his sympathies had been earlier. (His remarks about books of his published in the 1950's are, therefore, without relevance.) However, the point is a very, very minor one and I shall not belabor it.

Moore rejects the appellation "neo-Marxist." I define what I mean by the term as applied to him quite precisely in terms of two propositions which I think underlie his analysis. If he does not like the term I will call him anything he wishes. I still think that I am correct, despite his "explicit disclaimers." The reader will have to judge for himself. Moore also denies that he used the expression "non-repressive society." I never asserted that he did. I did argue that his analysis, since he fails to distinguish among degrees of exploitation in the societies which he examines, and since he strongly implies that socialization into all past societies has been uniformly brutal (see the citations and quotes in my paper), only make sense if one assumes that this is his assumption. If I am wrong then many of the more pithy phrases he uses are mere rhetoric, and the book is a far less substantial work than I thought it was.

Moore also denies that he is critical of Max Weber. I never said that he was critical of all of Max Weber's work. I did assert that he was critical of Weber's belief in the autochthonous

causal efficacy of values, especially of religious values, and of Weber's emphasis on the role played by religious ideas in the development of European capitalism. Moore's sharp disagreement with this view and the view of those scholars (such as Robert Bellah) who start from a similar perspective is quite obvious in the book as a whole and on the pages I cite.

As to the substantive points: Moore claims that he never asserted that the Civil War was necessary if a coalition of northern business and southern Junkers was to be avoided. I refer readers to the chapter itself and to the whole thrust of the book, but let me quote some passages on the pages I cite, lest the issue be in doubt:

German experience suggests that, if the conflict between North and South had been compromised, the compromise would have been at the expense of the subsequent democratic development in the United States. (p. 115)

Such an alignment would have been of Northern industrialists and Southern planters against slaves, small farmers and industrial workers. This is no abstract phantasy. Quite a few forces pushed in this direction before the Civil War . . . any peaceful solution, any victory of moderation, good sense and the democratic process, would have had to be a reactionary solution. (pp. 131-132)

In the United States plantation slavery was an important aspect of capitalist growth. On the other hand, to put it mildly, this was an institution unfavorable to democracy. The Civil War overcame this obstacle, though only partially. (p. 421)

Second, Moore argues that our differing interpretations of Mary Wright's book are merely differing interpretations. Not so. It is perfectly proper for a scholar to draw supporting evidence from a book with a thesis contrary to his own. It is *not* legitimate for him to cite the book as supporting his thesis. Moore cites Wright as supporting his contention that, during the Restoration period, reform was blocked entirely by class interests. While Wright certainly does say that class interests played a role, she emphasizes cultural variables, as, for example: "Third, and most important, Restoration leaders did not spend much time thinking about commerce, not even about its evils. . . . Commerce was not worthy of systematic attention." (Wright, p. 170). Time and time again, Moore draws implications which are not legitimate from his sources. Indeed, in my essay, I did not cite all the instances which could be cited.

The adequacy of Moore's comparison of the role of the Chinese and Japanese gentry and my

critique readers will have to judge for themselves. His comment is too general and the issues too complex for an extended discussion here. I do stand corrected on one point. The word is "exploitative" not "exploitive." I shall never forgive my "helpers" for missing that one.

Moore's use of Beals (along with others) is designed to prove that large landlords in India exploit to the limits of their ability and are opposed to innovation. He rejects my citation as not to the point, and argues that, on the very same page I cite, Beals supports him. Let me quote in detail from the pages in question.

Landlords are the educated men of their villages, the innovators who introduce new agricultural techniques, the protectors who alone are capable of dealing with police officials and settling conflicts. . . Many villages have irrigation reservoirs, wells, schools, and other improvements because the landlords were able to influence government officials. Although people in Gopalpur would be delighted at an opportunity to divide their Gauda's property among themselves, the prospect of their being no Gauda whatsoever fills most people with dismay.

The desire of government officials to raise the status of jatis which have been condemned to follow the more menial and less remunerative occupations occasions even more doubts. A farmer cannot weed and harvest his crop without labor. If those who now serve as laborers are converted into farmers there will be no one to do the weeding and harvesting. . . . People in Gopalpur are told that they must stop discriminating against people in low-ranking jatis, but they are not told what to do in order to obtain the services formerly performed by them. (Beals, pp. 82-83)

As is quite clear from this quotation and a reading of Beal's book as a whole, not only do large landowners (Gaudas) perform services which are not simply in their self interest narrowly defined, but the views ascribed to large landowners by Moore are actually ascribed by Beals to "people in Gopalpur," i.e., the small farmers and shepherds who make up the bulk of the population.

Both Beals and I are for land reform and a shift in the structure of power. Neither of us (for I accept his analysis) believes that large landowners act purely or even primarily out of altruism. Indeed on page 78 Beals does point out that large landowners have no incentive to lend new brands of seed to those who borrow from them because they will gain no advantage from this and will be blamed if the seed fails.

This, however, is not the point. The point is that nowhere does Beals ever imply that the large landlords are merely interested in maxi-

mizing exploitation, or that the problems faced by India are merely or even primarily the result of exploitation. Rather, as he notes, the problems faced by Gopalpur and the difficulties of reform stem from the fact that: "The culture of Gopalpur is an organic whole; its religion and its social organization are adapted to the economic tasks traditionally carried out in the village." (Beals, p. 83).

One final point. I have, in the course of my academic writing, criticized other scholars in much the same vein that I have dealt with Moore's book. Some have responded, as does Moore, by questioning my craftsmanship (a legitimate ploy), but none has attacked my motives by implying that I was a member of the establishment attempting to stifle dissent by conducting what amounts to a "Congressional inquiry" masked by a "scholarly facade." This is an effort to dismiss a critic by accusation, because the expected academic reaction is one of horror and contempt. Thus it serves much the same function in the academic world that accusing a person of being a Communist did for segments of the non-academic world in the 1950's. This kind of "left-wing McCarthyism," to use I. F. Stone's phrase, has become increasingly common of late, and threatens to reduce the possibility of reasoned intellectual discourse.

It is hard to know how others will interpret the words one puts on paper. While I was sharply critical of Moore, I do not think that I suggested he was someone else's man or motivated by some secret destructive purpose. In short, I assumed his intellectual integrity. I regret that he has not been able to respond in kind.

Smith College

STANLEY ROTHMAN

TO THE EDITOR:

Simply to keep the record straight, I should like to comment on a minor (to most readers no doubt trivial) point in Professor Wolin's "Political Theory as a Vocation" (this REVIEW, December, 1969, pp. 1062-1082).

Professor Wolin remarks: "It is excusable that a decade ago a political scientist could contend that only a 'fanatic' would want to 'maximize' political equality and popular sovereignty at the expense of other values, such as leisure, privacy, consensus, stability, and status." Presumably because this egregious assertion is "excusable," Professor Wolin generously displayed forbearance in not citing the source, which is my *A Preface to Democratic Theory* (1956), pp. 50-51.

Because the needs of condensation and forceful prose have produced a one-sentence summary

that may cause many readers to misinterpret my argument—as quite possibly Professor Wolin himself has—I take the liberty of appending the fuller text. What I intended to say, and so far as I can read my own words accurately, what I did say, was that no one, except perhaps a fanatic, would *completely* sacrifice *all* other values to any two political goals, even two goals as lofty as political equality and popular sovereignty. In the interval since I wrote that book I have changed my mind about a great many things, but not about this. I cannot believe that Professor Wolin means to imply that he would himself sacrifice *all* other values to gain these two ends. For my part, happily, I have never run into anyone who by the testimony of his own life and activity demonstrated that he really meant to do so, and I am quite sure this applies to Professor Wolin also. Were I to encounter such a person, I think I would be justified in regarding him as a political fanatic, or at any rate as a person with an exceedingly narrow vision of the good society.

That some people sometimes write as if they would act in this way is to me only further evidence that political rhetoric invariably outruns political commitment.

Yale University

ROBERT A. DAHL

TO THE EDITOR:

My reason for not attributing the paraphrase to Professor Dahl was the one which he hints at. I was aware of recent statements which represent a change in his viewpoint, but I was not certain about the extent of the modifications. As the context makes clear, I thought it typified a widespread opinion. If he has been offended, I sincerely apologize.

The remainder of his letter raises issues which cannot be dealt with thoroughly in this forum. Perhaps a few observations are appropriate. First, although it is awkward to dispute claims based upon personal experience, which is why it is considered bad scientific and philosophic form to argue in this manner, Professor Dahl's formulation, that he has never encountered anyone who would sacrifice "*all* other values" to gain the values of political equality and popular sovereignty, leaves me puzzled on other grounds. Does "*completely* sacrifice" mean to destroy or wholly surrender something for something else so that the thing destroyed can never be sought as long as the preferred thing is still preferred? If so, then, of course, the fanatic does not exist who would "*completely* sacrifice all other values to any two political goals," because, at the very least, he would retain the value of life, i.e., he would devote time to eating and sleeping. Such a concept of a fanatic has been best described by

Professor Dahl's language: it "tells us nothing about the real world. From it we can predict no behavior whatsoever." (*Preface*, p. 51.) I doubt, therefore, that the concept is of much help in detecting the hypocrisy alleged to exist between "political rhetoric" and "political commitments." Perhaps this explains why, for the most part, Professor Dahl's fanatic in the *Preface* appears more pliant than the fanatic in his present communication. The latter seems rigid and obsessive ("*completely* sacrifice *all* other values"), the former more accommodating, unwilling to sacrifice completely, preferring to maximize, to calculate costs, and to accept incremental gains.

Perhaps Professor Dahl
has changed his mind after all.

Second, what interested me about the passage as a whole (*Preface*, pp. 50-51) was not the relative merits of fanatics and marginalists, but the way in which the problem was formulated and what was selected for contrast. It seemed revealing to me that the word "fanatic" should come to mind in the course of a contrast between two strongly political values (political equality and popular sovereignty) and an assortment of values associated primarily with social, private, or material matters ("leisure, privacy, consensus, stability, income, security, progress, status. . ."). There is a certain bland and unprovocative quality about each of these items and it requires some effort to imagine any of them arousing the passion associated with the dictionary definition of fanatic, "too great enthusiasm." A world may be congealed in the choice of a word. Accordingly, the formulation seemed to me to belong to the same family of assumptions which support a pluralistic, bargaining conception of society and to explain in some measure why many political scientists have not been particularly alarmed at the apathy of the American citizenry. It is the nature of "us marginalists" to characterize all political enthusiasts as fanatics or deviants.

Perhaps, as Professor Dahl notes, "most of us are marginalists" and perhaps "it is an observable fact that almost no one regards political equality and popular sovereignty as worth an unlimited sacrifice of these other goals," but it is also an observable fact that over the past decade a significant number of black leaders, draft resisters, and politically active students have acted, not as marginalists, but as marginal men determined to challenge the dominant assumption which identifies rationality with privacy, etc. and fanaticism with equality, etc. The Latin root of fanatic also means "inspired by a deity."

TO THE EDITOR:

Let me add a third point of view to the two discussions of my book *Public Policymaking Reexamined* (this *Review*, September, 1969, pp. 915-921).

My basic disagreement with both reviewers concerns their frame of appreciation, which is "normal" political science. (I am using the terms "normal," "paradigm," and "scientific revolution" as proposed in *The Nature of Scientific Revolution* by Thomas S. Kuhn, Chicago: University of Chicago Press, 1962.) My major endeavor is to try and work out a new paradigm of "policy sciences" to help face the major crisis of irrelevance for acute human concerns facing contemporary political science. The main concept expressing the essential concern of my book is *meta policy*, that is policy on how to make policy. My main claim is that meta policy is a critical variable in determining the quality of concrete policies, that meta policy can be studied, that meta policy can and must be improved, and that the study and improvement of meta policy should serve as the foci of a new interdisciplinary of policy sciences, based in part on a transformed political science. To accept the analogy used by the second reviewer, though not his conclusion, I think we must improve the "engine" of policymaking as such. Without minimizing the need for other approaches, I do think that a "policy science" paradigm is essential for increasing the contributions of knowledge and science to human affairs, and I try in my book to explore some of the new frameworks, concepts and theory needed for that purpose.

It is a pity that the reviewers did not squarely face my efforts in that direction. They take up implications of my approach rather than the approach itself. For instance, I agree that detailed application of my ideas to concrete policy areas will be necessary, but exploration and explication of new basic concepts and general theory must come first. For my purposes most available empiric studies of policymaking (however valuable from the point of view of "normal" political science) are indeed too narrow and lack a comprehensive theoretic foundation. (I am sorry, but I think the bibliographic essay at the end of the book, however selective and by now outdated, precludes the defense of "lack of familiarity" kindly suggested by the first reviewer.) To sharpen the differences between the first reviewer and myself: I reject the criterion whether my "proposals fit into the empirical literature . . . and prescribe a set of goals that are consistent with existing knowledge" (p. 916). The correct test of my approach should be whether it opens up promising vistas

for novel knowledge and action. To illustrate: From my reading of the new emerging paradigm of policy sciences, the "normal" conception of basic different roles of the academic and the practitioner (put forth by the first reviewer on p. 918) is unacceptable; instead, we must develop a new type of policy oriented scientific role, to be fulfilled by a new class of academics and based on innovative knowledge.

Evaluation by "normal science" is at least legitimate (by definition), though inappropriate, missing the main thrust of my book and failing to face issues of dominant importance for the future of political science and politics. What is completely unacceptable, even by the tenets of "normal political sciences," are failures to understand the elements of the book and misquotations in discussing them—as done by the second reviewer. To illustrate:

1. A major part of my book is devoted to evaluation and presents a set of operational secondary criteria correlated with net output and therefore helpful for evaluating policymaking and policymaking-improvement in terms of impacts on reality—indirectly, but in a useful and the only feasible way. The second reviewer fails to understand this structure, quoting three of the involved logical steps (on page 920), but ignoring the fourth and critical one: While net output can almost never be evaluated directly, *it can and should be reliably evaluated through an explicit set of secondary criteria.*

2. I agree that the title headings of some of my improvement suggestions are not exciting (not having been written for a mass audience newspaper). But each one of these titles opens a discussion of concrete proposals, with substantive contents, ignored by the reviewer. Typically, the one improvement suggestion regarded favorably by the second reviewer, namely redundancy, is presented by him as unprovable. This is a mistake, as the "fail safe" functions of redundancy can be proven even mathematically, as explained in the book (page 211 and note 11 there).

Let me conclude by presenting a scheme for the evaluation of book reviews, illustrating the distinction between primary and secondary criteria. It is up to the reader to judge, after examining my book, whether my parameters are correct.

SIMPLIFIED SCHEME FOR EVALUATION OF BOOK REVIEWS
(Applied to the reviews of *Public Policymaking Reexamined*)

PRIMARY CRITERION	<i>Review One</i>	<i>Review Two</i>
Extent of help to reader in deciding whether to read a book and how to read a book; extent of help to author to improve his thinking	Note: This primary criterion is difficult to use. Therefore, a set of secondary criteria must also be used, which should satisfy two conditions: (1) They are correlated with the primary criterion; (2) They are operational.	
SECONDARY CRITERIA	<i>Review One</i>	<i>Review Two</i>
Book has been closely studied by reviewer	Yes, with exception of Bibliographic Essay	Doubtful
Book evaluated in terms of normal science or (when applicable) new paradigms	Normal Science	Normal Science
Review shows understanding of the book and its main argumentation	Narrow Understanding	Parts Yes Parts No
Review provides correct summary of main ideas	Partly	No
Review deals with overall <i>Gestalt</i> of the book, in addition to particular elements	No	No
Review provides intelligent discussion of particular elements of book	Yes, within a conservative frame of appreciation	No
Review avoids mala fides and personal hostility	Yes	Yes
Review avoids misleading and out-of-context quotations	Yes	No
Review avoids misleading side remarks and innuendos	No	Yes
Review avoids main preoccupation with the reviewer's own pet subjects	Yes	Yes
Overall evaluation in terms of cluster of secondary criteria	Fair, within the framework of a traditional approach; fails to consider challenge of new paradigms	Sub-standard

Politicheskaiia nauka v SShA: Kritika burzhuannykh kontsepsii vlasti. (Political Science in the USA: A Critique of Bourgeois Conceptions of Power). BY VALERII GEORGIEVICH KALENSKII. (Moscow: Iuridicheskaiia literatura, 1969. Pp. 103.)

When Soviet scholars began to conduct empirical sociological research at the beginning of the 1960's (for the first time in three decades), they devoted their first monographs to criticism of Western "bourgeois" sociology.¹ Now in 1969, when the birthpangs of political science are being felt (simultaneously with the founding of the section for the study of social-political phenomena at the new Institute of Concrete Sociological Research in Moscow), there has appeared in print the first serious Soviet study of American political science. Like his predecessors in sociology, Kalenskii aims not only at providing information about areas of inquiry and methodologies current in the West, but also at helping to legitimate the new area of study in the U.S.S.R. by demonstrating its potential contribution to the ideological struggle with the West.

In a relatively short survey Kalenskii succeeds in communicating a great deal about American political research today and about its intellectual origins. He combines both focus and breadth in his pithy restatements of the main ideas and findings of the literature he discusses. Given the difficulty in obtaining Western publications in the Soviet Union, I find impressive Kalenskii's choice of important and representative examples of the ideas he discusses.

The book consists of three long chapters and a conclusion—one chapter on the origins and history of American political science, especially the growth of behavioralism; a second chapter on the concept of power, interest group theory, pluralism and elites; and a third chapter on political socialization and participation, political culture, legitimacy and alienation. A list of authors whose works are discussed in detail includes: Merriam, Lasswell, Easton, Bentley,

Truman, Schattschneider, Hunter, Dahl, Mills, Lane, Kornhauser, Lipset, Almond, Verba, Mathews, and Murphy.

In the tradition of the sociology of knowledge Kalenskii explains the rise of political behavioralism in terms of changes in the social environment. Like Western analysts (e.g. Eckstein) Kalenskii asserts that the disintegration of European democracies into fascist regimes and the consequent development of elitist political theories stimulated empirical study of American democracy (p. 9); also, that the replacement of "traditional American isolationism" by "the unprecedented foreign policy expansion of American imperialism, actively interfering in international political life" (p. 20) (it might have been put more delicately) stimulated sociological analysis of the international political situation and the political systems of foreign countries.

A sociology of knowledge approach also influences Kalenskii's critique of American political science. Usually, he judges the underlying value biases or normative assumptions of the social scientist, as evidenced in his research or in his reaction to the results of his research. Rarely does Kalenskii consider a work on its own grounds, by examining the accuracy of the research or the appropriateness of the conclusions. (The main internal criticisms deal with semantic or conceptual problems, such as Easton's blurring of the difference between social and political power (p. 27) and Lipset's somewhat strained attempt to distinguish between political science and political sociology (p. 14)). In short, the critique is primarily ideological.

Ideological critique is often useful in delving behind research and providing a larger perspective from which to view it. When exaggerated, however, such critique leads to simplicity, dogmatism and distortion. Kalenskii's ideological critique of American political science consists both of the constructive and the exaggerated varieties. For example, the author rightly points to the primary concern of Almond and Verba (in *The Civic Culture*) (p. 82) and of David Truman (in *The Governmental Process*) (p. 35) for the stability of the democratic polity; to the general bias of functional analysis in this direction; and to the classic approval of political apathy by Berelson *et al.* in one of the early voting studies. (p. 67). Yet, after describing in detail Donald Mathews' *U.S. Senators and Their World*, "a very serious positivistic analysis of the problem of leadership," Kalenskii condemns the author for failing to criticize his finding of a predominance in the Senate of men from middle

Zamoshkin, *Krizis burzhuanzno individualizma i lichnosti; sotsiologicheskii analiz nekotorykh tendentsii v obshchestvennoi psikhologii SShA* (Moscow, 1966).

or upper middle class origin. (p. 59). In the case of Richard Merelman's article on the use of symbols in political legitimation, Kalenskii sees only dangerous manipulation; "this recommendation of speculation on democratic slogans is a clear illustration of an approach to problems of political life so characteristic of contemporary positivistic American political science, which pretends at objectivity and ideological neutrality. The narrow class basis and apologetic nature of such recommendations is completely obvious." (p. 79).

Fixation on ideological critique leads at best to a valid but narrow kind of criticism which omits such important evaluative considerations as the fit with reality, so appropriate in dealing with *empirical* theory. In the Soviet context, however, critique of this kind has the advantage that by focusing on the researcher rather than the research itself, it leaves open the possibility of similar research being carried out in the USSR, albeit in a different spirit! And indeed, the research least scathed by Kalenskii is the highly empirical work (e.g. Matthews, Lipset, Murphy) most akin to research presently feasible in the U.S.S.R. Just as empirical research without accompanying middle level propositions has been characteristic of the first decade of "concrete sociological research,"² so the first genuine political science research is highly empirical. Typical is the research conducted recently by the sociological laboratory of the Institute of State and Law on the activities of deputies to local soviets.³ In the near future one may expect other studies of relatively powerless institutions, those whose concerns are with primarily symbolic functions or local regulatory ones; and perhaps, studies of leadership or decision-making in social and economic institutions.

In his study Valerii Georgievich all but explicitly welcomes political research in the Soviet Union. It is not accidental that he stresses the role of the "natural process of integration and differentiation characteristic in the development of science" in the emergence of political research in the USA and then draws an analogy with two fields of social science which have only recently been established in the USSR, criminology and management science. (p. 4) In addition, Kalen-

sii emphasizes the usefulness of political science research to American political leaders (p. 61); by implication it could help Soviet leaders as well. Furthermore, Kalenskii states that "many facts of political reality brought to light in the course of empirical research can and must be used by Marxist scholars studying the political organization of capitalist society." (p. 98).

From a Western point of view Kalenskii has offered no original criticisms—his most valid and interesting ones Western scholars have offered before. Appropriately, Valerii Georgievich ends the book by citing the perceptive critical articles of Christian Bay and Jack Walker which appeared on the pages of this journal (APSR, March 1965 and June 1966) (p. 101). He has succeeded, however, in providing the Soviet reader with a clear picture of the range of American political science and of its main issues and ideas, at least in the area of democratic politics. This is no mean accomplishment.

Columbia University

Children in the Political System: Origins of Political Legitimacy. BY DAVID EASTON AND JACK DENNIS. (New York: McGraw-Hill, 1969. Pp. 440. \$9.75.)

This is the second major volume to come out of the "Chicago" study of political socialization among elementary school children. The first volume (Robert D. Hess and Judith V. Torney, *The Development of Political Attitudes in Children*, noted in this *Review*, December, 1968) was written more from the point of view of the psychology of child development. In the present volume Easton and Dennis analyze the same data from a political science perspective, and particularly from the viewpoint of systems analysis.

The empirical base for the book is over 12,000 questionnaires filled out by children in grades 2-8 in eight cities across the United States. The analysis is limited by the inclusion of only white, urban children and by the single time period covered. These limitations are undoubtedly excusable in an initial study, however, and while not avoiding generalizations, the authors extend their findings with considerable care.

The focus of the book is exclusively on children's views of political authority—primarily the President and policeman, but also including less obvious personalities (the average Senator), institutions (Congress and the Supreme Court) and more abstract objects (government). These objects are studied for their visibility and salience to children, and for the children's cognitive and affective images of them. The chief findings

² See especially the critique of early sociological studies by V. A. Iadov, "Rol metodologii v opredelenii metodov i tekhniki konkretnogo sotsiologicheskogo issledovaniia," *Voprosy filosofii*, 1966, No. 10.

³ "Effektivnost deputatskoi deiatelnosti (Opyt konkretnogo sotsiologicheskogo issledovaniia na materialakh Armianskoi SSR)," *Sovetskoe gosudarstvo i pravo*, 1969, No. 1.

are conveniently summed up by the authors under four headings (pp. 391-2): politicization, personalization, idealization, and institutionalization. Politicization refers to the fact that young children learn to distinguish between family authority and a power external to and superior to the family. Personalization means that children become aware of political authority first and most easily via contacts with individuals. This leads to the "head and tail" effect, wherein youngsters learn first about the extremes of President and policeman. Idealization of authority occurs early in life, as political figures are viewed as extraordinarily benign. This halo, of course, wears off as children progress through the elementary grades. Finally, institutionalization refers to the process of shifting one's attention and affection from individuals to political institutions.

For each of these features of early socialization, Easton and Dennis discuss in detail the implications for the political system. It is interesting in this connection that they conclude that three of the four fundamental processes are probably universal among "persistent" (carefully distinguished from "stable") political systems. Politicization, personalization, and institutionalization are features of socialization nearly everywhere, but "hostilization" may occur when the government is not perceived as benevolent.

Most of the book is concerned with aggregate response patterns and changes over the grade school years. In two chapters, however, an interesting but mostly unsuccessful attempt is made to find predictors of the children's images of authority. A multivariate analysis in Chapter 17 shows grade, city, partisanship, and religion to be among the best predictors of children's feelings. But in all cases the relationships are very weak. Some minimal support is also found for the psychoanalytic hypothesis that ratings of political authorities are transferred from comparable ratings of the father. The reason for their limited findings is not at all obvious, but one wonders whether it is in large part due to the fairly low stability of children's responses (reported in Hess and Torney, pp. 238-40).

The book's chief virtue lies in relating the findings about early socialization to the persistence and stability of political systems. That this is done expertly, there can be little doubt. However, whether the work contributes to the enhancement of political theory, as the authors wish, is partly dependent on how one judges systems analysis. Regardless of one's view of that approach, a positive feature is the emphasis on change as well as stability of political systems. This is done not only by arguing that systems

analysis is not bound to the status quo. Rather, adult ratings of policemen are specifically introduced to show at what age individuals are most likely to contribute to change in the political system. (The findings point to the early adult years.) In addition, the term "hostilization" is coined in order to emphasize the non-universal nature of American children's positive views of authority and to stress the possible impact of alternative affective images.

Another positive feature of the book is that the authors avoid the notable pitfalls of the Hess and Torney volume. It is made clear, for example, that however much change takes place during the elementary school years, socialization continues on into the adult life-span. In fact, for some orientations, socialization may just be beginning at adolescence. Similarly, the unwarranted judgment of the primacy of the school is absent in the Easton-Dennis work. However, perhaps to avoid this problem, teacher's responses are often left out, even though with careful interpretation they can be quite useful.

A possible defect is the book's narrow focus on "system politics," which prohibits the inclusion of data on participation, partisanship, party differences, voting, etc. Ordinarily this defect might be more critical. Here it means that the Hess and Torney volume must be looked at as complementary. In particular, the material in Chapter 4 of that book helps expand on the subject matter of the present work. Moreover, on the basis of Hess and Torney's findings in their Chapter 7, it would be interesting to see the results of Easton and Dennis' multivariate analysis on topics other than images of the President and policeman.

Another unavoidable drawback of the book is that much of the data now seems redundant. After reading Hess and Torney, Greenstein, and various articles by Easton and Hess, the findings will not surprise anyone. Perhaps because of this, the book seems overly long in many places. For a similar reason, particularly the overlap with Easton's other writings, the first hundred pages seem excessively drawn out. The book is at its best in the later chapters when data on adult views of authority are added, the multivariate analysis is undertaken, and "cross-system" implications are considered.

An omission which might have added some freshness to the analysis is to see whether some children are ignorant and/or alienated about most objects of political authority while others are knowledgeable or positive about nearly all objects. It is argued in Chapter 13 that there are multiple "open doors" through which children can become aware of and supportive of po-

litical authority. But nowhere is it seen whether children's views of one political authority are correlated with perceptions of other political figures. This could happen, of course, even when the aggregate responses about authorities are rather different. Along the same lines, the relationship between cognitive and affective images could be explored empirically. The aggregate development suggests that the more knowledgeable students become about politics, the less ideally they picture it. Does this occur at an individual level within each grade? Or do greater knowledge and less idealization covary simply because they are both functions of age and experience?

In spite of these criticisms, the Easton-Dennis book helps round out the reporting of the Chicago study by tying in the findings on early socialization to the development of support for political authority. In doing so, it has gone further than most studies in discussing the implications of empirical work for the functioning of political systems.

RICHARD G. NIEMI

University of Rochester

Violence in America: Historical and Comparative Perspectives, A Staff Report to the National Commission on the Causes and Prevention of Violence. EDITED BY HUGH DAVIS GRAHAM AND TED ROBERT GURR. (U.S. Government Printing Office, 1969. 2 vols. Pp. 644. \$1.25 each.)

This Report to the National Commission on the Causes and Prevention of Violence contains twenty-three papers on various aspects of violence by historians, humanists, and social scientists. The papers are grouped under nine general topics, including historical and comparative accounts of violence in Europe and America; the effects of immigration, the frontier, class, and race as factors contributing to violence in America; characteristics of crime in the United States; patterns of domestic and international strife; the process of rebellion; and ecological and anthropological perspectives. Two basic conclusions emerge: first, violence is a common recurring condition in all parts of the world, during all periods of history, at all stages of social development; and second, no coherent analytic framework exists within which the causes, processes, or consequences of violence can be understood or even systematically described.

The belief that violence is a pathology has a profound hold upon us. Biblical prophecies of a harmonious golden age; the Platonic ideal of a strife-free Republic; the myth of an idyllic state of nature; utopian visions of co-operative communities; the Marxian prophecy of a society

without coercion—all attest to a deep repudiation of violence as a form of behavior. Yet a major theme throughout this Report is that violence has been endemic in human history: the past is ridden with violence; we are surrounded by violence in the present; and the future holds promise of even greater violence. As Charles Tilly puts it: "The nature of violence and the nature of society are intimately related. Collective violence is normal."

We also view violence through a selective historical memory which distorts our understanding. There is a widespread tendency to deny the occurrence of violence, to suppress our knowledge of it. The past appears more peaceful than it was and present acts of violence seem ever surprising. To quote Tilly again: "The collective memory machine has a tremendous capacity for destruction of the facts." No less than moral repudiation of violence this distorted perception impedes attempts to study and explain violence.

Granted that resort to violence is a central fact of human history, what have been its overall effects or consequences? Several authors struggle valiantly with this question. They conclude that violence can have both good and bad effects; its consequences have been both positive and negative. In the words of historian Richard Maxwell Brown: negative violence is "in no direct way connected with any socially or historically constructive development," while positive violence is associated with "popular and constructive movement." But how can we tell positive violence from negative? Unfortunately, there is no clear basis upon which to distinguish the positive effects of violence from the negative. Brown himself includes urban riots as negative violence and agrarian uprisings as positive: surely too much depends on how one understands and appraises the particular causes at issue and the outcomes. This difficulty in evaluating types of violence confounds all who try to make such judgments. It seems easy to concede that violence can have positive effects—after all, the nation itself was born in revolution—but it is impossible to find a basis for evaluating the acts of violence around us.

Although the authors of the Report agree that resort to violence is a pervasive fact of social life, they show far less agreement on how violence should be studied. Differences in analytical approach are not simply a reflection of different disciplines: the approaches are more varied than disciplinary divisions would suggest. Even definitions of the subject vary. Some authors consider in their analysis only actions that inflict death or injury, while others include acts of "turmoil," such as strikes, demonstrations, and

other peaceful collective behavior. Beyond these definitional differences, the studies also differ in other basic ways: in the levels of generality at which they approach the subject; the types of variables they stress as critical; the time-spans they adopt; and the kinds of evidence upon which they rely.

Levels of generality range from a medical psychiatrist's universal propositions about human nature to historians' accounts of episodes on the American frontier. The most convincing studies approach violence as a social condition which can be explained in general terms but which is at the same time related to particular circumstances. Two especially successful examples of this mingling of general and particular factors are sociologist Charles Tilly's "Collective Violence in European Perspective" and historian Sheldon Hackney's "Southern Violence." Tilly shows how different forms of violence accompany transitional and modern social and political conditions in Europe. Hackney attempts to explain the exceptionally high levels of violence in the South with several socio-economic variables, and concludes that psycho-cultural factors peculiar to that region must be taken into account.

A large section of the Report is devoted to two studies, one by Ted Gurr and the other by Ivo Feierabend, Rosalind Feierabend and Betty Nesvold. Both chapters are based on cross-national aggregate data analysis of the recent past. Gurr's study offers a general description of violence in the world from 1961 to 1965 and then turns to correlational analysis of the conditions of violence. Gurr faces serious difficulty in converting available quantitative data into convincing indicators of the theoretical variables he hopes to relate to violence.

One unavoidable conclusion is that we must have better measures of numerous independent variables before we begin accepting or rejecting hypotheses. As in his earlier work, Gurr's handling of quantitative material and analysis is sophisticated and insightful.

Feierabend, Feierabend and Nesvold face all Gurr's data problems plus those associated with a longer time period, 1948 to 1965, and overtime analysis. They recognize that most of the interesting hypotheses about violence are dynamic and require overtime data for testing or description. Although change variables are utilized, the analytic framework remains cross-sectional rather than longitudinal. It is clear that more refined data for longer periods of time are needed to do justice to the middle range theorizing we already have. Without such data it is hard to see how present theory about violence will be improved.

Other political scientists who contributed to the Report are Raymond Tanter, James Davies, and Edward Gude. Tanter investigates the relationship between escalation in Vietnam and forms of domestic violence and turmoil in the United States. He concludes that no relationship between the two conditions can be found for the period 1965-68. Davies attempts to account for instances of rebellion and revolution in terms of the frustration that accompanies rising expectations and decreasing gratifications. Gude examines factors associated with violence under Batista and Betancourt.

The Report is intended as background analysis for recommendations on national policies to prevent violence. Ordinarily we would not ask with respect to a collection of scholarly papers, Are they useful to policy-makers and advisors? But in this case the question seems more appropriate, even though the authors appear not to have become particularly concerned about the policy relevance and implications of their analysis. What can a policy-advisor draw on from the Report?

The policy-advisor can stress, first, that violence is a common condition in all types of societies, including modern industrialized societies. Second, although the incidence and forms of violence are related to general social conditions, distinctive factors in American history and society make us as a nation especially prone to individual and collective violence. Third, the effects of violence are not always negative, but no clear basis exists for determining what the effects of given acts of violence will be. Fourth, no widely-accepted explanation for the causes and patterns of violence is yet available, although several studies in the Report indicate that progress along these lines is possible. So far as the United States is concerned, the Report supports these propositions: given the social, economic and political conditions in the United States severe violence such as revolution and internal war is extremely unlikely; moreover, given these same conditions, even the relatively mild riots and demonstrations of the 1960's must be regarded as unexpected. Actually, much of the Report is deviant case analysis of regions of the United States and of particular forms of violence. All of which adds up, no doubt, to a plea for more research—a comforting conclusion perhaps for the scholar but less satisfactory for the policy-maker.

WILLIAM FLANIGAN AND EDWIN FOGELMAN
University of Minnesota

Puerto Rico: Freedom and Power in the Caribbean. BY GORDON K. LEWIS. (London: Merlin Press, 1964. Pp. 622. \$10.00.)

Modernization of Puerto Rico: A Political Study of Changing Values and Institutions. By HENRY WELLS. (Cambridge: Harvard University Press, 1969. Pp. 440. \$9.95.)

Puerto Rico has quite correctly attracted the attention of these two sensitive and erudite scholars to explain its political peculiarities. The Puerto Rican experience has special relevance for the Caribbean in particular, and for students of Comparative Politics generally.

All aspects of the island's political life are usually considered as unique or peculiar: its constitutional status, its culture, and the pattern of political leadership and organisation. These apparent peculiarities have not surprisingly led to two separate and widely differing interpretations in the volumes under review. Henry Wells presents us with a case study which is sympathetic to the efforts of the United States to transform a turgid Spanish-American culture into a dynamic Anglo-Saxon polity. Gordon Lewis, by contrast, is wary of this Americanization and explains Puerto Rico's difficulties as being directly a by-product of American control.

For Caribbean scholars, the Puerto Rican phenomenon has always proved somewhat puzzling, and these two case studies will go a long way in providing some of the answers. To begin with, they tell us a great deal about the efforts of the Puerto Ricans to transform their society. However, for those Caribbean states which have glibly assumed that the Puerto Rican experience can be easily emulated, these studies should raise some serious doubts about the desirability or the possibility of adopting the Puerto Rican model. Lewis and others have pointed out clearly some of the political consequences of following the pattern of what New World economists like Lloyd Best have called "industrialization by invitation." These studies indicate that this pattern may not necessarily be a solution for the twin problems of economic development and political stability.

Henry Wells, following the recent literature on political modernization, has attempted to look at the Puerto Rican experience as a case study in modernization. Some of us, and particularly those of us living in Third World countries, have raised some doubts about the use of this category, especially the normative content implicit in the doctrine as used by the apostles of modernization. Inkeles and Weiner in particular have not convinced us that modernization is not just another word for Americanization. With Gordon Lewis, we must query whether these analytical categories, especially the distinction between traditional and modern societies is indeed valid.

Apart from considerations of the theoretical

validity of this concept in general, Puerto Rico, in common with other Caribbean societies, does not possess the characteristics which we normally associate with the traditionalist societies of Asia and Africa. Morse in another context has raised the whole question of whether New World societies do not present us with a special case that requires new analytical categories. Those of us in the area, especially the New World economists, have found it much more fruitful to use such concepts as the plantation system as the point of departure rather than the categories of traditional or transitional systems. Wells, unfortunately, has applied somewhat naively the notions of traditional society from the students of Afro-Asian politics, and has not taken account of the very special conditions that have created the Latin-American and Caribbean plantation societies.

Silvert, along with Morse, have long warned us of the dangers of including Latin America in the body of theory that has been built up about underdeveloped areas. It may be that Wells would have done better if he had left the theoretical baggage of structure-functional theory at home before he looked at the political experience of Puerto Rico.

One of the major dilemmas that both Lewis and Wells attempt to come to terms with is what the effects of this experiment have had on the Puerto Rican male personality. Wells is optimistic about the stability of the Puerto Rican personality, concluding that there has been a transformation from a submissive personality to a more rational one. Lewis, on the other hand, sees the continuance of docility and submissiveness, which is a cover for rage and anger. Elsewhere I have commented on the nature of the colonial personality, especially in the Commonwealth Caribbean. Superficially, we appear to have a special problem in that the Puerto Rican is neither a colonial nor a free man. He seems to live in a perpetual world of ambivalence, which places him in a special love/hate relationship with the United States. However, if Gordon Lewis is correct in his assessment of the Puerto Rican personality structure, it is very close indeed to that of the formally colonized individual which is also characterized by a high degree of authoritarianism.

It was Munoz Marin who fully understood this phenomenon. This remarkable political personality still awaits a good biographer. He is within the tradition of Caribbean political leaders who fully appreciate the function of a colonial leader as a bargainer or rather as a middle man between his masters and his people. Robert Anderson in his book "Party Politics in Puerto Rico" has already described for us in full detail

his remarkable capacity to manipulate the electoral system and thus maintain political control for a decade. Anderson demonstrated how Munoz institutionalized his power base, transformed his party organization and related his party to government; thus offering us a structural explanation for the rise and the continued existence of the whole Munoz regime. He avoided the easy psychological explanations offered by Wells and at the same time also avoided Gordon Lewis' aversion to everything American.

The usual question that is asked by those who study politics dominated by a single personality is "after Munoz, what or who"? Munoz was certainly unsuccessful in trying to create a personality to take over where he left off. However, the real question is not "after Munoz, what or who"? but rather the capacity of a system to decrease its dependence on a single leader and simultaneously the capacity of a party system to adapt itself to the new situation. The capacity for a political system to guarantee a successful transfer of power is what is normally associated with the term stability. Since Anderson examined the question in its structural setting he has come closer than the others in predicting the outcome of the most recent developments in Puerto Rican politics.

Puerto Rico may well be entering a new stage in its politics that may prove to be quite similar to what has taken place or is beginning to emerge in other parts of the Caribbean. One detects the emergence of a new kind of politics in the area where personalism may be giving way to the political managers who are capable of controlling the electoral machine either through gerrymandering and/or creating a party oligarchy. Concomitantly, however, when machine politics of this variety develops, and at the same time the basic economic problems of the society do not improve for large numbers of the populace, there is growing disenchantment of the youth and the unemployed with bureaucratic politics, and a growing cynicism towards the political system. However, as the political system has become more entrenched the elites become increasingly tense about the maintenance of the system and thus respond in a repressive way.

There appears to be a growing feeling in the region that political independence has not secured psychological decolonization and that this will not be achieved until there is economic independence and structural reform of the economic system.

These two recent works have contributed considerably to our understanding of some of the Puerto Rican "peculiarities." The time may be

soon approaching when a more systematic comparative study of Caribbean politics will be forthcoming. This prospect appears more assured now that we have a number of case studies appearing with some regularity. It is only comparison with other Caribbean states with similar economies and social structures that will tell us whether the Puerto Rican experience has been unique. I don't think so.

The Study of Policy Formation. EDITED BY RAYMOND A. BAUER AND KENNETH J. GERGEN. (New York: The Free Press, 1968. Pp. 392. \$9.95.)

This is a landmark book in the study of public policymaking in the United States. Bringing together nine papers on the study of policymaking, the book surveys available knowledge, presents normative models, explores research methods, poses missions for the future, and provides concrete policy cases.

In the first chapter, the senior editor presents a general framework for the study of policymaking, and for the book. "Policy" being defined as "strategic moves that direct an organization's critical resources toward perceived opportunities in a changing environment" (p. 2), the study of policymaking should be concerned simultaneously with: (1) intellectual "decision-making" activities; (2) social-organizational policy-implementation processes; and (3) the dynamics of feedback and environmental change leading to policy revisions. Recognizing the limitations of available behavioral and normative models, Bauer proposes to study policy formation by fusing a social process view with a decisionmaking orientation, and puts forth a multi-dimensional research strategy, moving from systems survey and leverage points mapping to intense study of individual senior decision-making.

The next three chapters are devoted to surveys of available knowledge. Richard Zeckhauser and Elmer Shaefer provide a concise, inclusive and readable discussion of normative economic theory applications to public policy. The survey is innovative, for instance, in explicating its value assumptions, in discussing the costs of information and of flexibility, and in dealing with redistribution benefits in addition to efficiency benefits. Joseph L. Bower presents an excellent discussion of organizational and group decision theory, with an original emphasis on the ability to improve performance rather than achieve a rigorous behavioral theory. Enid Curtis Bok Schoettle (the only political scientist among the ten authors) concludes the state-of-

the-art surveys with an analysis of political science contributions, which is somewhat outdated—probably because of technical reasons.

The next two chapters by Kenneth J. Gergen deal with policymaking study methodologies. First, Gergen provides a three-dimensional model for the identification of leverage points, to be mapped by issue relevance, personal efficiency, and policy sub-phase. With the help of a variety of survey techniques, individuals are to be classified in terms of this model—individuals being regarded by Gergen (who is a psychologist) as the most important sub-unit of the policymaking system. The second methodological chapter provides an elementary discussion of basic research methods, which is perhaps out of place in the book as a whole, but which includes some important observations on the highly neglected study of individual high-leverage decisionmakers.

The case studies concluding the book deal with urban mass transportation (by Lewis M. Schneider), with technology transfer from NASA to the civil economy (by Edward E. Furash) and with decisionmaking on foreign aid (by Theodore Geiger and Roger D. Hansen). Quite interesting by themselves and rounding out the book as a reflection of the contemporary study of policymaking, there is nevertheless little internal relation between these descriptive chapters and the rest of the book: The theoretic concepts and methodological recommendations of the first six chapters are not really utilized in the case studies, and the data presented in the last chapters is not relied upon in the first part of the book. This is a weakness; but I think this weakness serves to illuminate the state of study of policymaking till very recently.

I started this review by calling this book a landmark. It is indeed a landmark in presenting most of what is known now and in indicating some of the needs for the future. Most of the book's weaknesses are faults of the contemporary study of policymaking—which cannot but break through despite the efforts of the editors. Two such main weaknesses are the tendency towards micro research and reductionism; and ambivalence on the relations between behavioral and normative approaches.

(1) Most parts of the book follow micro and reductionistic approaches to the study of policymaking, in which main emphasis is put on instances of incremental policymaking within a slowly changing situation. Social movements, aggressive ideologies, radical changes in conditions, survival issues, needs for far-going innovations—all these phenomena, which by now are no longer strangers to the United States, cannot be perceived, analyzed and dealt with by the

frameworks, models and methods available in the present study of policymaking as reflected in the book. Especially surprising in 1968, and nevertheless typical, is the statement by Schoettl that “dramatic breaks with the past such as the atomic bomb, or the space program . . . can be treated as *random disturbances* in the otherwise stable and incremental policy-making process, only *momentarily* producing a fluctuation in the old patterns of policymaking which quickly reassert themselves” (p. 119, emphasis added). It is such jumps which shape the whole policy-space and should be among the foci for study and improvement. But in order to deal with such happenings, policymaking must be regarded as a complex systems phenomena, with emphasis on the study and evaluation of the policymaking system as a whole and development of models for the improvement of meta-policy (that is, policies on how to make policies), including policymaking system redesign. And such an approach needs more than empiric study of micro situations, incrementalism and economic model building.

(2) The strong desire of Bauer and some of the contributors to help in meeting the urgent needs of policymaking improvement are chained by the above mentioned limits of contemporary behavioral research methods on one hand and the narrow domain of available normative models on the other hand. Bauer, seeing this dilemma, expresses high hopes for long-range improvements of practice while recognizing that all that the practitioners at best can get out from available knowledge “is . . . to deepen his comprehension of the range of problems with which he is accustomed to deal and thereby to help him to invent better solutions of his own” (p. 5). How to change our behavioral study of policymaking and how to develop new normative models for improving policymaking—these are questions posed by Bauer but not taken up in the other chapters of the book. Indeed, even some of the already available more relevant ideas—such as policy impact evaluation, explicit post factum and real time social experimentation, sequential decision models, alternatives futures construction and strategic analysis methods—are not mentioned in the book, neither as theoretic frameworks for innovative behavioral research nor as approaches to policymaking and metapolicymaking improvement.

Even though there is only one political scientist among the ten authors (or, a cynic may say, because of that fact), this book should be carefully studied by the increasing number of political scientists worrying about how little our discipline has to contribute to better policymaking. Learning from the richness of what is included

and its inadequacies, we still stand a chance of building up policy sciences—if we are ready to make the necessary jumps in our own concepts, methods and traditions. This book indicates that if political scientists lag behind, there is reason to hope that the necessary job may nevertheless be done by others.

The RAND Corporation, Santa Monica

The Politics of the Southern Negro: From Exclusion to Big City Organization. By HARRY HOLLOWAY. (New York: Random House, 1969. Pp. 374. \$8.95.)

Professor Holloway departs from the tradition of V. O. Key, Jr. and Prothro and Matthews in this study of Southern politics. The *Politics of the Southern Negro* is a straightforward narrative account of the politics of the region, and includes not a single chart or table. And though the book is replete with insightful observations about politics in the South, its methodological shortcomings, lack of an explicit comparative framework, and inadequate conception of political change, greatly restrict its value for the serious student of the Negro and politics in the South.

The author is well aware of the limitations of his work. At the outset, for example, he concedes that his method of gathering data for the study was inadequate. The primary source of data for the *Politics of the Southern Negro* was interviews which the author held with 200 Southerners, black and white, in the communities he studied. As a Northern white, in an alien setting, he found that his "main problems were interview bias and inaccurate or hazy factual information." We should not exaggerate our eyebrow raising about Holloway's procedure, however; for we recall that, in 1964, when much of the data for the book was gathered, even the Survey Research Center at Michigan had only recently become aware of the dubious validity of white-to-black interviews.

The essential problem that Holloway is dealing with in this study is how to account for political change and development among Negroes in the South, though he does not state the problem this way. His approach to the problem is to conceptualize the South as a "modernizing traditional society," and, within this framework, to analyze the political behavior of blacks on a continuum from the extremely traditional soci-

ety (e.g., Mississippi) to the modern society (e.g., Atlanta). At the same time, he attempts to apply the ethnic group formulations of Lane and Dahl to the political behavior of blacks in these communities. (His conclusion about the applicability of these formulations to the black experience is not unambiguous. Nevertheless, he does seem to feel that the black situation cannot be analyzed in traditional ethnic group terms because "no other group has come from such low status and had to battle so hard to win even a modicum of the rights taken for granted by other Americans.")

Professor Holloway offers us no explanation as to why he chose to investigate the eight communities he did, although the study for the most part vindicates his intuitive judgment as to what is "traditional" and what is "modern." Another methodological difficulty presented by the study is the fact that the political units of analysis are not comparable. In Mississippi he deals with the state; in Macon County, Alabama, Fayette County, Tennessee, and Marion County, Texas, he deals with counties; and in Birmingham, Houston, Atlanta, and Memphis, he deals with cities. There may have been sound reasons for this, but Professor Holloway does not set them forth in the book.

But the most serious shortcoming of the study, from my point of view, is the absence of a genuine comparative framework to guide the research and the analysis. The study would be much more useful had the author taken systematic account of the effects of (correlation between) such variables as: the formal rules and structures of each of the systems; their environmental characteristics; the political cultures and decision-making structures; the role of personality; and the impact of the non-systemic forces (e.g., the Federal Government) on black political behavior in the eight communities. This is not to say that he does not deal with these factors, but to say only that they are not built into his analytical framework. As a consequence, it is almost impossible to know what the major dynamics of change are, and why communities next to each other on the traditional-to-modern continuum differ so much. Having said this, however, I must add that the Federal Government emerges from this study as one of the major modernizing forces in the South.

Professor Holloway found that black politics differs from community to community, even within the so-called modern or developed systems. Blacks in Houston tended to team up with the Latins, labor, and liberal white Democrats. The author does not feel this coalition is necessarily to the advantage of the blacks. In Atlanta, they allied themselves with the white pa-

* Any views expressed in this paper are those of the author. They should not be interpreted as reflecting the views of The RAND Corporation or the official opinion or policy of any of its governmental or private research sponsors.

tricians. Holloway does not find anything wrong with this coalition, but he is skeptical about whether it is the best of all possible arrangements for blacks. (He correctly predicts the breakdown of the coalition.) His ideal seems to be Memphis where, since Crump, blacks have developed a hard-nosed, non-ideological attitude toward political alliances, and have tended to enter them on the basis of pragmatic considerations from election to election. Memphis seems to be an interesting city, insofar as the political development of blacks is concerned; and it would repay much more careful and systematic investigation. Holloway's work suggests a curvilinear relationship between education, income, and political sophistication as between the better educated and higher income population of blacks in Atlanta and Houston, and the lesser educated, lower income blacks population of Memphis. It is astounding that the number of blacks registered to vote in Memphis rose from 7,000 in 1951 to 93,000 in 1964! This is 75% of the black population. (By comparison, for example, there are only 80,000 blacks registered in Atlanta as of September, 1969—and the black population there exceeds that of Memphis by about 50,000. Percentage-wise, black registered voters in Memphis outnumber those in Atlanta by almost a 2-1 margin.)

In my opinion, one of the strong points about Professor Holloway's study is the fact that he makes his value judgments openly rather than covertly. After reading the ubiquitous assessments of the black experience by such political scientists as those at the Harvard-MIT Joint Center, it is a pleasure to find at least one white political scientist concluding that "The black American need not defer to the accomplishment of any other Americans, whatever their origins and talents."

Morehouse College

Political Leadership in India: An Analysis of Elite Attitudes. By MICHAEL BRECHER. (New York: Frederick Praeger, in cooperation with the Centre for Developing-Area Studies, McGill University, 1969. Pp. 193. \$12.50.)

Of the non-Western areas, India is certainly one of the most written about and studied by political scientists. Although there have been several background type analyses of various Indian elites, there has not been a serious examination of how the Indian national elite perceives its role and how it interprets the political system in which it operates. Michael Brecher's *Political Leadership in India* meets this need. The book does not, and it should be pointed out that this was not the author's principal goal, tell us

very much about the Indian elite structure in general nor does it add very much, except as a source book, to our understanding of comparative elites.

In March of 1967 Brecher sought the cooperation of eighty-two Indian political leaders in New Delhi for the purpose of administering a questionnaire. Eighty agreed. This group consisted of 63 politicians, 6 academics, and 11 journalists. All the respondents, excepting two of the journalists, were Indian. The questionnaire, which Brecher includes in an appendix, was administered in all but one instance by the author and most interviews lasted a little more than an hour. With only a few exceptions, the author reported good rapport and cooperation from the interviewers. The questions were highly specific and were designed to elicit replies in three areas: the reasons for the Congress decline in the 1967 elections, the qualities of leadership and the ranking of Congress leaders, and the contest for the Prime Ministership in 1967.

The resulting work makes a major contribution to our understanding of contemporary Indian elite perceptions in these three areas. Each of the 32 questions is analyzed separately, with a nearly complete breakdown of the responses by elite category. Perhaps the most interesting finding concerning the elite's perception of the Congress reverses is the strength of the focus on political institutions rather than on public policy. About forty percent of the Congress M.P.s perceived no connection between any government policy and the Congress reverses. Of the remainder, devaluation was mentioned as a contributing factor by about 53 percent of the Congress M.P.s. The other elite groups shared this same emphasis. Institutional factors such as Congress factionalism and a more united opposition tended to dominate the interpretations of the results. Brecher suggests that, in Almond and Verba's terms, the elite perceives the mass as a "subject" clientele. We should not fall into the fallacy of misplaced significance here: perhaps elites everywhere give a similar weight to organizational over substantive factors. In any event, the unresponsiveness that this attitude suggests would appear to be unfortunate in the Indian context.

The same theme reappears in the discussion of qualities of leadership. The emphasis here among the Congress elite was on qualities associated with maintaining organizational effectiveness, not on policy effectiveness. Thus, Morarji Desai was the Congress elite's second choice, despite the fact that he ranked highest in qualities associated with making successful economic policy. He was, in the Congress elite's eyes, inferior to Mrs. Gandhi in organizational skills, and so

was less attractive, over all, as a Prime Minister.

Brecher has as keen an ear for what is not said as for what is. He notes in this chapter that not one member of the elite, official or non-official, Congress or non-Congress, considered skill in foreign policy to be necessary to a Prime Minister. Another notable "non-effect" was that Mrs. Gandhi's charismatic link to her father, in the opinion of most respondents, was of no or only marginal utility to the Congress.

Of course, Brecher says a great deal more, and briefly relates his findings, at the end of the book, to Aptor's reconciliation/mobilization typology. The only major methodological addition this reviewer would have liked to have seen would have been the computation of the four-fold *phi* at several places. Hopefully, the material upon which the analysis rests will be made machine-readable and offered to the scholarly community.

The disappointing aspect of the book is the author's substantial failure to relate his findings to the large body of elite studies that have been made. Although there have been some notable exceptions such as Russett's *World Handbook* and Almond and Verba's *Civic Culture*, progress in comparative politics has not been realized through studies with an explicitly comparative focus, but rather the same topic has been approached in different ways in different countries in different time periods. Eventually a body of work develops, and, despite a great many minor irregularities, common themes become evident. A notable example of this in the field of elite studies, as Samuel Patterson has pointed out, is the trend toward occupational democratization in the membership of parliaments as a function of time.

This method of building a science of comparative politics may be awkward and may often slip into trivia and bad political history, but given the country-focused interest of most comparativists and the organization of the academic environment, it is likely to remain the way it must be done for some time. It is therefore incumbent upon a scholar, when he has written a work dealing with some topic in his country of interest, to relate his findings systematically with the body of work in other polities. Comparative political studies has, like art, illuminated its subject matter by presenting the universal in terms of the particular. Consequently, an author should not let the more general (and thus analytically more important) significance of his work remain obscure, hoping that some other scholar will relate it to the sub-discipline as a whole.

In this regard, Brecher states that "There is

no body of literature which deals systematically with elite images of one's own political system." Although this reviewer can not recall another work that follows Brecher's closely, there are certainly a substantial number that are relevant to it. These would certainly include, for example, Deutsch *et al.*, *France, Germany and the Western Alliance: A Study of Elite Attitudes on European Integration and World Politics*, Seligman's *Leadership in a New Nation*, and, taking a different approach, Cnudde and McCrone's "The Linkage between Constituency Attitudes and Congressional Voting Behavior." There is also a major body of work dealing with Indian politics *per se* that would have illuminated *Political Leadership in India*.

Unfortunately, Brecher makes very little reference to this literature. Only five scholars are cited in the entire work, and they very briefly. One citation of W. H. Morris-Jones simply identifies him as the Director of the Institute of Commonwealth Studies, but does not refer to the relevant work. On the same page, a reference to the "consequences of the election results for India's political system" is footnoted as "By various American and Indian scholars." A plurality of the citations in the volume, which number fewer than twenty, cite the author himself. There is no bibliography.

Even given the difference in approach toward explicitly relating one's work to the work of others in the British and the American traditions in scholarship, Brecher does very little in this regard. However, it should be remembered that this is a criticism of what Brecher did not do. What he did do he did quite well, and it is much needed.

ROBERT SIDWAR ROBINS

Tulane University

Bureaucracy and Participation: Political Cultures in Four Wisconsin Cities. By ROBERT R. ALFORD. (Chicago: Rand McNally & Co., 1969. Pp. 224. \$6.50.)

Since the time in the late 1950's and early 1960's when Edward C. Banfield, Robert A. Dahl, and others restored by their work intellectual vitality to the study of urban politics, political scientists have been groping for new directions to take in a field that has now, with the student and popular interest in cities, become a matter of general concern. The methodological debate over how to study the distribution of power is not settled, but increasingly it seems sterile and, one suspects, perhaps irrelevant. How power is in fact distributed is hardly irrelevant, but finding a theoretical approach by which to assess the consequences of that distribution seems more important.

One possibility is to study the policy outcomes of local political arrangements, but measuring those outcomes for any large number of cities has not proved as easy as some at first hoped. Another is to conceive of American urban politics in terms of the concepts of political modernization. Doing this in a way that produces more than merely the substitution of one set of labels for another ("modern" or "mobilized" in lieu of "professionalized council-manager systems" and "traditional" in lieu of "political machine systems") is harder than it first appears; in addition, concepts that seem to work for backward nations about which we know relatively little seem inadequate for cities about which we are a good deal better informed. A third approach might be to look at the relationship between the enduring features of a city—its economic base and its population characteristics—and its political behavior, indicating thereby the constraints within which power can be exercised and perhaps also the sources of change in the distribution of that power, but even if successful such a view does not make any easier answering the question of how political arrangements intervene between socio-economic factors and public policy.

Robert R. Alford, a sociologist at the University of Wisconsin, has bravely tried, in a slim but rich book, to explore all three conceptual positions, linking them into a more or less coherent theoretical structure and illuminating that structure with data drawn from four Wisconsin cities—Madison, Racine, Kenosha, and Green Bay. He begins with the differences in the economic bases of the communities as a way of understanding why each has a different political culture, defined in terms of two variables: the degree of bureaucracy and the level of participation. The highly bureaucratized, participatory system he terms "modern," the unbureaucratized, non-participatory system he calls "traditional." A trading center (Green Bay) is more likely to have a traditional political culture, a professional center (Madison) is more likely to have a modern culture, and cities with a manufacturing base are likely to be mixed cases depending on whether the economic leadership of the community is inactive and drawn from absentee-owned large corporations (as in Kenosha) or energetic and civic-minded because of the special character of locally-owned firms (as in Racine).

Each political culture has a set of distinctive "public norms": in a modern city, the police are highly professionalized (and thus issue a lot of traffic tickets and arrest a lot of juveniles), the courts are busy with a great deal of litigation, the political system provides many opportuni-

ties for women, and the zoning officials tend to apply their ordinances strictly and consistently. In the traditional city, the police are less zealous, the courts less busy, the female politicians notable for their absence, and the zoning officials more inclined to accommodate special requests. These public norms—the universalistic ones of the modern city, the particularistic ones of the traditional one—are in turn productive of different kinds of public decisions. Madison has several heavily-funded poverty programs; Green Bay has only one program with token funding. Madison was a leader in getting an urban renewal program underway, Green Bay was much slower and the other two cities have yet to start. And of course Madison was among the first cities in the state to fluoridate its water supply.

These "political cultures," it turns out, are properties of the structure, functioning, and history of local government, *not*, so far as Alford could tell, of the attributes of citizens. He found no distinctive orientation or ethos among voters that was associated with residence in one or the other city; religion and social class explain, in the usual manner, the attitudes of the citizens. In the modern city, college-educated persons get to be leaders who, whether liberals or conservatives, tend to be cosmopolitans; in the traditional city, less-well-educated persons occupy leadership positions and take a more parochial or localistic view of matters. In short, differences in attitudes are real but they seem not to be the product or a predictor of local political arrangements; on the other hand, differences in political structures tend to persist in part because they recruit different kinds of persons into leadership positions.

Obviously, this is a stimulating and in many places quite original work. It is a major effort to provide a new and coherent intellectual direction to the study of urban politics, and thus deserves wide attention. But it also raises as many questions as it settles. The measures of bureaucracy and participation leave a good deal to be desired: it is hard to distinguish "bureaucracy" (the multiplication of offices and specialization of function) from "professionalization" (the emergence of administrators with "professional" norms and reference groups). Thus, Madison's innovativeness may be less a function of bureaucracy than of a special kind of bureaucracy—one with strong professional orientations. Similarly with "participation"—Alford's data refers primarily to *organized* forms of participation (active political parties, intensive campaigns many civic groups, high voting turnout) and thus he concludes that Green Bay is not "participatory." Yet in the account of Green Bay poli-

tics, we are told that almost all Green Bay leaders went "to great lengths to insure consensus before they acted" and the mayor in particular "makes concessions, negotiates, and feels out the ground before making a move." (p. 49). I would bet that one reason why so little happens in Green Bay is precisely because it is so participatory in an informal way—if anybody has any strong objections to anything, the proposal is blocked.

Given these conceptual problems, and noting that the mixed cases (Kenosha and Racine) never turn out to be very interesting, I would suggest that a simpler way of defining these political cultures that is consistent at least with the Wisconsin data is the *level of organization* of public life. Madison is highly organized publicly (in bureaucrats and parties) and privately (in civic groups); Green Bay is less organized. To go beyond the Wisconsin cases, I suspect one would have to distinguish among *kinds* or *modes* of organization, whether particularistic and person-regarding (as with a political machine or fraternal lodge) or universalistic and community-regarding (as with a Good Citizens' League or Housing and Planning Council). But this is all speculation, not criticism, and indicates that Professor Alford has opened up some fresh perspectives and provided some new directions in the study of urban politics.

JAMES Q. WILSON

Harvard University

Peace Among The Willows: The Political Philosophy of Francis Bacon. BY HOWARD B. WHITE. (The Hague: Martinus Nijhoff, 1968. Pp. 266. Guilders 33.)

Professor White has brought to fruition his vast knowledge of the political writings of Francis Bacon in a work that is at once scholarly, systematic, and engaging. The author's sometimes astonishing interpretive and synthesizing abilities combine to make this perhaps the most novel and thorough account of Bacon's scattered thoughts on politics, morality, and science. At a time when political philosophy is struggling to gain its bearings and relate itself to the social science enterprise, it is helpful to reconsider Bacon's contribution in the context of White's very divergent and perhaps equally unsatisfactory position.

White's identification and discussion of Bacon's two societies, his utopia where science rules, and the society which was a condition necessary for constructing the former, leads him to divide his attention between Bacon's provisional morality and politics and his definitive

morality and politics. The account of Bacon's provisional morality and politics is gleaned and constructed from a great range of disparate sources. White argues that Bacon attempted to reconcile scientific advance with political conservatism and tried to overcome the obstacles of despair by preparing men's minds to hope. In discrediting the old ways symbolized by Aristotle and superstition, Bacon hopes to inculcate the virtues of charity, political pliance, and a high regard for external goodness and fortune. Bacon prefers a monarchical government of cautious imperialistic dispositions to stimulate science, civic peace, commerce, and religious toleration. White believes that Bacon saw Britain as the ship that would take mankind to the New Atlantis.

Bacon's utopia, the New Atlantis, is, like Bacon's natural philosophy, still futuristic and not yet complete. It is, however, a place where science conquers chance and determines change, where royal power diminishes, commerce withers, and the rule of humane and compassionate scientists prevails over statemanship and war. This ancient christian society glories in the beneficence of scientific invention guided and controlled by philosophy. Rational hedonism characterized by sober luxury, beauty, health and longevity is made everlastingly pleasant and stable by the reconciliation between patriarchal society and a young, vigorous, and progressive science.

White's purpose is not only to explicate Bacon's political thought but to expose the sterility and danger of political faith, the distinctive characteristic of utopian thought. It is said that the prevailing faith in a beneficent science, in experts, and in the ultimate solution of political problems is a debt that we uncomfortably owe to Bacon. Now White has many useful comments on the question of utopian thought however questionable it is to discard Plato and More as utopians because to them nature is something that is fixed. (Although sometimes they are said to be simply pre-modern utopians). It is disconcerting to discover that the remedy advanced by White to combat an unregulated and dangerous utopian faith in science is nothing less than a political philosophy with an element of faith in no smaller proportions or pervasiveness. The only hope is for a political philosophy which can know the good, what man is, what the best political community looks like, the nature of the soul and even the cosmos. White surely equals Bacon in the scope and unconstructed character of that which we are asked to believe. There is little justification for this new faith. Few reasons are offered to show how it is less blind, less dan-

gerous, and more qualified to guide practical decisions and to ordain the proper paths of scientific invention and use. It is in confronting science with his view of political philosophy that White is most disappointing. There is little here that is either novel or penetrating. The old Straussian denunciation of science as ill-suited to determine values, or judge what is a healthy society or what is just provides a less than compelling or systematic treatment of the question. Nor does White entertain the possibility that the fruits of science, especially a thoughtful social science, might be of some assistance in the development of a political philosophy.

White's mode of analysis is no less Straussian and no less demanding of faith, however insightful and productive it appears to be. White does not suppose that a great writer "would make contradictions, flagrant contradictions, absent mindedness. . . ." (12) and so by ingenious interpretation of Bacon's use of words, fables, myths, numbers and colours, he exposes the "secret teaching" on a subject matter which is at once "hard to know" and "unfit to utter," a teaching addressed to the "legitimate and best minds" (110). White's impressive scholarly interpretation loses some of its force insofar as the code is never clearly explicated, the criteria in terms of which certain meanings are selected and evaluated is never precisely outlined. This procedure may be inescapable in making sense out of Bacon, but the result is clearly White's Bacon. Consider the ingenious detection of Bacon's meaning in his presentation of the chief scientist clad in peach coloured shoes, a white gown and a black cloak. We learn that "when built on eros or standing on eros, that which receives all (material cause) may be covered by that which receives nothing (final cause)." (196) This proceeds from White's use of ancient and contemporary sources, the ancient ones being those "with which Bacon *must* have been familiar and which *may* have had some meaning for him." (175)

White contends that modern man, whether liberal or socialist, is "essentially Baconian," that it was Bacon who stole fire from the gods and led us into the labyrinth of modernity. We are said to be bound by the world created by modern thought "particularly the thought of Francis Bacon." It is surely paradoxical that a secret teaching of such devious and hidden meaning, not accurately exposed before White's subtle examination, should have enjoyed such a direct and pervasive influence. Perhaps the factors that influence the course of events are more hidden than even Bacon or White imagined or possibly they are much more evident and

straightforward.

Elections in America: Control and Influence in Democratic Politics. BY GERALD M. POMPER. (New York: Dodd, Mead, and Company, 1968. Pp. 297. \$3.95.)

Pomper declares his purpose in his preface: "As a citizen, I have been disturbed by an apparent public cynicism about elections in the United States and the consequent disdain for the political process . . . This book is a deliberate effort to show that elections do have significance." (pp. ix-x) To accomplish such a purpose Pomper seeks to do three things: (1) to review, categorize, and synthesize the writings of political theorists concerning elections; (2) to briefly summarize and interpret the existing literature dealing with American political processes and institutions; and (3) to present the findings of four of his own research undertakings.

For his theoretical review Pomper fits together quotations from Plato, Aristotle, Machiavelli, Locke, Rousseau, Madison, Hamilton, Calhoun, and Mill; his own personal contribution is an attempted distinction between the direct and indirect effects of elections. "We will concentrate on two broad alternative effects—direct and indirect results of popular elections. Direct voter control would be evidenced by elections in which the choice of men also clearly indicated popular preferences on policy issues . . . In the absence of such mandates elections may have indirect significance. The actions of politicians might not be controlled in detail by ballots, but they might act in anticipation of voter reactions." (pp. 12-13) "Theorists generally have evaluated elections unfavorably when they have focused on elections as direct choices of wise men or wise policies. In contrast, they have been well-disposed to the democratic process when they have considered the indirect effects of popular choice." (pp. 32-33) "To provide criteria for evaluating the ballot, we have focused on elements of the 'traditional theory of democracy.' Our analysis suggests that this theory has been misunderstood and, consequently, that many modern criticisms of elections are misplaced . . . The advantages of elections have been seen in their indirect effects, particularly to protection of the voters, not in the wisdom of their decisions. To test the worth of elections, we should focus on their reputed benefits . . . It was Plato, after all, not Mill who measured the quality of a government by the wisdom of its rulers and the absolute truth of its decisions." (pp. 38-39)

The distinction between direct and indirect effects—which, once made, is used recurrently throughout the book—does not appear as useful to me as it does to the author. The difficulty is that both direct and indirect effects are premised upon the same ultimate claim: that voters are competent to differentiate candidates whose policies are favorable to their interests from those who are not. The only difference between the two cases in reality seems to lie in the actions of party managers and candidates rather than voters. In the one case by correctly foreseeing voter reactions and adjusting their policy proposals accordingly they guarantee that elections can have only indirect effects; in the other case the direct effect of the election upon policy is created by the actions of one or both party leaderships in misreading voter reactions and offering sharply divergent platforms. The underlying problem rests in Pomper's conception of linkage. He is presumably interested in the interrelationship between public preferences and public policies, but prejudices the question of where the linkage between the two must take place. In the preface he tells us that "Elections provide the linkage between the behavior of the voter and the actions of government . . ." (p. ix) and later: "In most castes, the voters can affect policy only through the election of politicians who will take actions desired by the majority of citizens." (p. 12) Most analyses of the linkage between public opinion and public policy avoid such narrow definitions of focus and the resulting confusion is evident in Pomper's quotations which intermix judgments concerning the wisdom of choosing policies on the basis of mass preferences with evaluations of the effects of elections in shaping policies.

The two descriptive chapters that follow manifest Pomper's awareness of other types of linkage and are among the strongest parts of the book. Chapter 4 on "Voters in America" is particularly outstanding and is the best succinct summary of the current knowledge regarding American voting behavior that has come to my attention. To those already familiar with this literature, however, Pomper's four attempts at addition will be of greater interest. The first of these—based in large part upon an article published in 1967 in the *Journal of Politics*—surveys party voting in presidential elections from 1828 to 1964 and seeks "to locate the historical occasions of party changes in presidential elections and to assess the policy effects of these changes." (p. 99) Fundamentally the essay is a classification of presidential elections by type, based upon Key's notion of the critical election as elaborated in the Survey Research Center's threefold definition of terms. In translating

these concepts to match his electoral data, however, Pomper distorts them in two serious ways. In place of Key's conception of a critical election as defined by its persisting effects Pomper substitutes a notion of critical change as sharp deviation from the past. Thus 1960 and 1964 both become critical elections—in Pomper's terminology, "converting elections"—without any demonstration of their impact upon later electoral patterns. Pomper also replaces the original assumptions of continuity and change in the electorate with correlation coefficients for the state-by-state presidential vote. The convenience in terms of available data sources is obvious, but the result is to make it impossible to evaluate Pomper's rejection of the conventional view that 1936 was a critical election of major import since his statistical techniques prohibit him from capturing intra-state party changes defined in class terms. Most seriously in terms of the book's larger purpose these voting changes are related to governmental activity only through the citation of a few commonplace historical sources, and the reader is left in doubt whether the election returns made any difference or—as Pomper neatly puts it—"Social trends were preparing a new political order." (p. 113)

Pomper then turns to the comparative study of American State politics for evidence. His topic is an interesting one: the relationship between elections for governor and state fiscal policies. In other work Hinckley has demonstrated that incumbent governors are far more vulnerable electorally than incumbent congressmen or Senators (or Presidents) while Sharkansky has spread out in his *Spending in the American States* a table of changing expenditure levels by states that can be read as a roster of the strong governors produced by the 20th century. Pomper's contribution is to relate two variables measuring the electoral success of the governor's party to five measures of tax increases and five measures of spending increases. His general conclusion is that no significant relationships exist and that it is mistaken wisdom to assume that increasing taxes contribute to a governor's rejection by the voters although suggestive yet inconclusive variations appear between Democratic and Republican governors and more competitive and less competitive states. As Pomper rightly notes: "In a science of politics, disproving hypotheses is as important as their confirmation" (p. 129), but in terms of his overall purpose of demonstrating the significant impact of elections the findings must be counted as negative.

Evidence far more convincing to the case is provided by the third analysis, undoubtedly the most interesting section of the book. In two chap-

ters—parts of which have previously appeared in the *Midwest Journal of Political Science*—Pomper exposes the Democratic and Republican party platforms of 1944, 1948, 1952, 1956, 1960, and 1964, to sentence-by-sentence content analysis and then compares the promises made with the promises kept. He demonstrates that campaign platforms are far less matters of empty rhetoric than often supposed, and that they consist in significant part of intelligible, specific pledges of future action. In all he finds 1,399 pledges which together constitute 27 per cent of all sentence statements in the 12 platforms. His central finding is that where both parties have made identical promises some 85% of the pledges have been substantially fulfilled; that the victorious party has carried out 79% of the promises idiosyncratic to its own platform; and that even the defeated party has succeeded in effectuating 53% of its pledges. As these figures suggest, Pomper also finds that the distinctive platform promises of the two parties are not usually in conflict, but reflect instead the differential campaign strategies of the two parties with the Republican platform emphasizing such nondistributive issues as defense and general government and the Democrats stressing particularistic gains for identifiable groups in matters of labor and welfare policy. For the limited range of issues on which the two party platforms do contain directly conflicting pledges Pomper provides overwhelming evidence of the effects of election outcomes in policy outputs, with 80% of the actions finally taken consistent with the promises of the winning party.

At minimum it can be said that Pomper has demonstrated that elections are occasions for policy-makers to summarize the policies they plan to pursue; at maximum it can be asserted that Pomper has proven that within certain areas of policy the victory of one party in the election has determined the programs that will be enacted. This by no means exhausts the content of the chapters, however, for the tables—though not strikingly easy to read—contain materials for many other conclusions, some but not all of which are discussed by Pomper. His detailed analysis of platform content is particularly instructive as to variations in campaign strategy between the parties, over time, and among policy areas, and his analysis of pledge fulfillment shows that promises are most often kept in respect to defense, agricultural, and resource policy, and least often in matters of civil rights and labor.

The subject of civil rights provides the material for Pomper's final analysis, the most controversial, difficult, but important test for his proposition. He seeks to prove that the protection of

Negro rights derives at least in part from possession of the ballot. Using the standard sources he summarizes the history of Negro political activity during Reconstruction and after and concludes: "It is an indication of the importance of the vote alone that black interests continued to be considered even after white supremacists returned to power." (p. 213) Although he may well be right Pomper is in fact unable from his data to disentangle the effect of the possession of the ballot from other influences affecting the position of the Negro at the time. Pomper's personal addition to the existent literature on the period is a series of tabulations of lynchings, public school enrollments, etc., intended to demonstrate that the vote was a determining element. He argues, for example, that disfranchisement removed one of the restraints on lynching since "political power was no longer even a possible defense, and the increase in violence evidenced the change." (p. 217) The relationship must remain speculative, however, when so many other uncontrolled variables are blatantly at work. It is simply not true to say, as Pomper does, that: "We cannot prove causation, but an association of lynching and disfranchisement would indicate the influence of the ballot." (p. 217) If the correlation is, in fact, spurious, and both variables depend upon some further unspecified variable the term "influence" is clearly inapplicable. The tabulations for lynchings and capital punishment are still further flawed by the failure to convert them to the per capita terms that would make them meaningful. In sum it seems likely that Pomper's argument will not convince anyone who begins reading with the prior conviction that black advances have been the result of other forces than the vote. The paradox runs deep, of course: if Negroes are permitted the vote when they pose no threat and denied it when they do, does this prove that the vote is a powerful influence? or a powerful symbol?

One final comment should be made concerning style. In his preface the author warns: "... (A)s a teacher, I have been upset, and ultimately bored, by quarrels over methodology. Tenaciously, but intolerably, opposing dogmatists insist that meaningful research can only be conducted through their prized techniques. In this work, I have deliberately been eclectic in the use of methods." (p. x) His editor, David Fellman, agrees and tells us: "... (I)t is refreshing to read a competent book which cheerfully makes use of various methodologies without being enslaved to any one and without making a fuss about it." (p. viii) I must disagree. An author can be enslaved by eclecticism as much as by any other methodology. Like most

political scientists Pomper does some things better than others and the effort to do a little of everything throws the book out of balance. Some chapters read like a well-done supplementary textbook; others like a well-done research monograph; others like a not-so-well-done research monograph; and one like an effort to include a chapter on theory to prove a point. At times eclecticism carries the author into subjects of which he knows too little. "(T)he British House of Lords agreed to its own loss of power after the voters supported the reformist Liberal party in 1910, and the U.S. Supreme Court ended its opposition to the New Deal after Franklin Roosevelt's landslide victory in 1936." (p. 66). And so on. The book would be the better for fewer "methodologies" and more concentration on the subjects that Pomper handles well and on which he has much to say.

Syracuse University

The Soviet Prefects: The Local Party Organs in Industrial Decision Making. BY JERRY F. HOUGH. (Cambridge: Harvard University Press, 1969. Pp. 416. \$12.50.)

Only recently have books on aspects of the Soviet political system made use of theories and models from the social science disciplines for purposes of either explication or verification. Instead, the tendency has been to engage in a detailed presentation of data and information that the author thought pertinent to his subject matter. Although some very good studies have been written this way, the study of Soviet government has tended to constitute a distinct enclave within the discipline of political science. Of course, this phenomenon is and will continue to be unavoidable to some degree, if only because the study of Soviet politics obviously carries with it several difficulties not present in study of the United States polity.

One reason this book is to be noted favorably is that it utilizes theoretical constructs in the examination and elucidation of the Soviet political process being studied, namely the nature of the involvement of the organs of the Communist Party at the *oblast'* and comparable levels in industrial management, planning, and decision-making in general. This is combined with the lucid presentation of the results of detailed research which clarifies and increases our knowledge of the people in the local organs of the Party, the work they do, and the ways in which they do it.

The main constructs put to use by Hough are those of Barrington Moore's "rational-technical society" and the conventional "monistic" conception of Max Weber's model of organization.

These are critically examined in the context of Soviet industrial decision-making to ascertain both to what degree they explain the political processes operative there and to what extent they are realistic models for the conduct of industrial administration and development administration in the U.S.S.R. and elsewhere.

The author states that Soviet society must . . . continue to deviate from the "rational-technical" model in at least three significant ways: the existence of illegal administrative practices, the participation of local Party organs in the making of industrial decisions, and the execution of political power functions by local Party organs. In addition, Hough criticizes the model for not taking into account deviations which must exist in any society and for neglecting certain important political phenomena. As for the Weberian view of organization, Hough argues, as have Simon and several other scholars, that deviations from its specifications are necessitated by the demands of an effectively functioning organization, and not only for the service of special interests, e.g., the power needs of the Communist Party. These arguments lead to another, more specific, thesis: area coordination by the local Party organs is a vital necessity for effective development administration (the Soviet state has long been engaged in a variant of development administration through the rapid and large-scale advancement and expansion of industry). The argument tying together these theses is that economic development and the expansion of industrial capacity and production is a nonroutinized process in which the values of precision, predictability, legality, and orderliness are outweighed by those of "creativity, initiative, and discretion." (p. 296)

This argument is derived from a realistic analysis of the actual ways in which the Party's local-level organs function vis-à-vis industry. Hough convincingly argues that the existing deep Party involvement in industrial matters is necessary for industry to function as intended, particularly in matters such as timely delivery of supplies and other aspects of cooperation among plants and organizations, e.g., the enforcement of contracts. The author contends that these operations on the part of the local Party organs are not capricious or excessive, but are limited, in effect, by conventions which became established as early as the 1920's and also by various objective factors, e.g., lack of time in relation to the Party organs' many other responsibilities, and the relative imbalance of knowledge and experience between the Party "coordinator" and the managers he supervises. Thus, the Party's "marginal and adjusting" (pp. 254-5) work in indus-

try is a regularized and "normal component" of its "executive responsibilities" (p. 171) which is objectively "useful" for the production process and also for the protection of regional interests (p. 270).

Hough's position is correct within the framework and perspectives he has adopted. However, if these were replaced by others which are also pertinent, the conclusions would not be so favorable to the Party's role. I agree that the "invisible hand" is not allowed to operate anywhere at present (p. 196) but does even the most effective functioning of industry justify the regulation of industrial life by a single organization which monopolizes the political power of the system. The local Party organs often function to realize the main goals of industry, but at a great, almost disabling effort and at a high cost in the initiative of the managers and the functioning of the formal organizations of industry, problems the present economic reform has not eliminated. Also, the acquisition of supplies in both the U.S. and the U.S.S.R. is indeed at times worked out informally, but there are political differences between the systems which outweigh these and other similarities in the operation of the economies. In other words, although the C.P.S.U. often aids in the effective functioning of industry, it is not exercising a benign influence throughout society or in all aspects of industry. Some of the major difficulties of the Soviet economy and society are systemic in nature and cannot be eradicated by this institution with its political stake in the system as it is. The author's arguments thus constitute an explanation and justification of only one aspect of the Party's role.

However, the book performs a real service in its effective destruction of many of the prevalent simplistic views of the Communist Party and its role in the economy. Hough shows that the meaning of the word "Party" varies with territorial level, function, and even situation. Also, he clarifies the meaning of the term "Party apparatus" used so indiscriminately and shows the apparatus to be a variegated group in terms of education and experience. In addition, he clarifies the role of the local Party organs in industry and their relationship with state agencies. The appendices dealing with the membership of Party committees and bureaus at the republic and *oblast'* levels and the listing of 170 major plants are an important bonus. The value of the book is enhanced by the results of interviews conducted in the U.S.S.R. and data gleaned there from some local newspapers which cannot be exported.

The Soviet Prefects is an up-to-date, well re-

searched, and thought-provoking addition to the few excellent books on the Soviet political system.

KARL W. RYAVEC

University of Massachusetts

How Communist China Negotiates. By ARTHUR LALL. (New York: Columbia University Press. 1968. Pp. 284. \$7.95.)

Negotiating with the Chinese Communists: The United States Experience, 1953-1967. By KENNETH T. YOUNG. (New York: McGraw-Hill Book Company, 1968. Pp. 443. \$10.95.)

A reader of this review will benefit from a brief score card. Kenneth Young is a former U.S. official and diplomat who negotiated with the Chinese at Panmunjon and is now president of the Asia Society. Arthur Lall is a former Indian diplomat who represented that country at the 1963 Geneva Conference on Laos and is now teaching at Columbia. The writer is a former U.S. Government official, now at the Brookings Institution.

None of us can, and indeed, in this particular case none tries, to escape our backgrounds. Lall's book is much more a memoir of the 1962 Laos conference than a general discussion of Chinese negotiating strategy. Young's study reflects not only his own experience, but also that of his colleagues in the Department of State, and largely reports on the bilateral ambassadorial talks between the United States and the Peoples' Republic of China. Thus, despite the general titles, the two books focus largely on specific aspects of the Chinese diplomatic experience, although they raise issues even beyond that of the question of Chinese negotiating style and strategy.

Much of each of the two books is devoted to a careful reporting of public and private events. A reader who wished to know what was said by representatives of the United States and China and the other participants in the Laos conference, or what the two countries said at the ambassadorial talks will find no better sources. Each book is based on inside information. Lall, as the Indian representative at the Geneva Conference, is able to report much detail not available from other sources. Young's study is equally rich. He claims that the book is based on press leaks and other published material. However, there is apparently more to it than that. At one point, for example, he notes that the press stories were inaccurate, and there is no doubt that this study reflects a knowledge of the U.S. government records of the conference.

Unfortunately, the books offer little that is

useful beyond the descriptions of events, although both authors do present brief discussions of general Chinese attitudes towards negotiations. What they offer is not particularly helpful in explaining Chinese behavior even at the meeting they discuss, or in predicting how the Chinese are likely to behave at future conferences. Lall, for example, tells us that the Chinese demonstrate flexibility based on their belief in inherent contradictions and are prepared to compromise in the short run because of their focus on long-run objectives. Young also reports that the Chinese have a long historical perspective. He notes that they view negotiation as an adversary process and that they place little value on the dignity of man. Such generalizations do not carry us very far.

Two larger questions are raised and at least implicitly dealt with in the two books. The first concerns the role of diplomatic negotiations in affecting the behavior of nations beyond the conference table. The second concerns the evolution of U.S.-Chinese relations since the establishment of the Chinese Peoples' Republic in 1949.

Anyone who spends any large part of his life engaged in a particular activity comes to believe in its importance in influencing the course of events; and authors need to feel that their subject is critical and self contained. Lall and Young are no exceptions. Having sat through the 1962 Laos conference, Lall clearly believes that it affected events in important ways, and Young is equally convinced of the valuable role played by the bilateral ambassadorial talks in shaping U.S.-Chinese relations. Lall also assumes that negotiations should lead to agreements. He leaves the reader in little doubt that their job is to carry negotiations to a successful conclusion. But, how important was this "successful" negotiations in affecting behavior?

The critical decisions regarding Laos had been made by the American government prior to the opening of the conference. President Kennedy had apparently concluded that he would not commit U.S. groundtroops to Laos to prevent its being overrun by North Vietnamese troops. He then charged Harriman with, in effect, negotiating the best arrangement that could be worked out, which hopefully would have the effect of discouraging a North Vietnamese attack. On the other side of the table, the Russians apparently were prepared to exercise some pressure on the North Vietnamese because of their concern that the Laotian situation would adversely affect the general trend of Soviet-American relations. China was not anxious for a military clash near its borders at this time. The conference painstakingly worked out an international agree-

ment on the neutrality of Laos to go along with the political sentiment among the Laotians themselves, which was negotiated separately. The details of the agreement may well have been influenced by the skill of the negotiators, and it of course is possible that the negotiations would have failed if not for the determination and energy of Lall and others in constantly bringing the parties together. Nevertheless, the basic story concerns the internal politics of Laos and the calculations in the United States, the Soviet Union, and China, both of which fall beyond the scope of his narrative, as Lall has defined it. Lall also does not concern himself with the implementation of the decisions of the conference and the future evolution of Laos. It is clear beyond a doubt that the North Vietnamese almost completely ignored the agreement to withdraw all foreign troops from Laos, and that within a few years the United States was also in violation of the agreement. A tripartite government ratified at the conference came into existence only on paper, and Laos very quickly fell into a situation of *de facto* partition.

How the situation on the ground in Laos would have differed, if at all, if the conference had not been held or it is ended unsuccessfully, is an interesting and important question with which Lall does not deal. Nor does he consider how Chinese behavior on other questions or the attitude of the United States towards China was affected by the results of the conference. If international negotiations of this kind are important, they are so only if they affect what actually occurs in the territory negotiated about, or the perceptions of the leaders of major countries about the likely behavior of other countries in the future. The Laos conference of 1962 did not have any major consequences. Nor, in fact, does Lall argue that it did.

Young explicitly tries to make a case for the central importance of these bilateral talks in shaping U.S.-Chinese relations. In particular, he seems them playing a critical role in the offshore islands crisis of 1968. Here again, however, the self-imposed limitations reduce the value of the work. Mr. Young does deal briefly with the general crisis situation, relying primarily on secondary sources, and then reports in detail what was discussed in Warsaw. However, since he does not consider the other moves being made by the parties, he falls into the trap of greatly overestimating the role of the talks. He also misses what I believe to be the key point; namely, that the Chinese asked for the talks as a way of reducing the likelihood that the U.S. would overreact to its probe by attacking the mainland, and that the U.S. agreed to talk, be-

cause given the intensive domestic opposition to the U.S. involvement, it had no choice.

On the broader question of U.S.-Chinese relations, Mr. Lall has little to say, and Young's treatment is handicapped by an attitude common to semi-official discussions of such issues—the assumption of moral rectitude. Implicitly, and at times explicitly, he proceeds as if the United States was seeking to improve relations, was acting from noble purposes, and was negotiating “sincerely.” At the same time, Young points out Chinese acts of duplicity, the unreasonableness of Chinese behavior, and their constant efforts to use the talks for their own ends. At one point, in discussing the period 1954–55, when the Chinese were seeking limited steps to improve relations, and the United States was resisting them, Young does allow that the United States may not have acted as forthrightly as it might have in seeking improved relations. In writing from this perspective, Young gives an accurate picture of the attitude with which bureaucracies approach their relations with other countries. Most outside observers would argue that a major chance to improve relations was deliberately passed over.

Bureaucrats assume that the objectives of their nation are consistent with a higher good, and that the other side's sincerity is open to question. More important, they resist analyzing the other side's behavior, taking into account that its bureaucrats believe just the opposite.

But Young's framework is distorting. The U.S. and China alternated in seeing the talks as useful and in favoring limited steps to increase contact. For both governments these were decisions taken in the context of their overall objectives and were basically tactical. During most of the period covered in Young's book, the United States was at least hoping for the overthrow of the PRC and was negotiating mutual security treaties with China's neighbors; it was through-

out supporting a rival government on Taiwan and building up its military strength in the Far East because of a widely shared belief in the U.S. Government that the Chinese leaders were aggressive and expansionist. The Chinese leaders, fearful of an American attack, were supporting the North Vietnamese and, in general, seeking to reduce U.S. influence in Asia.

Given the interests and suspicions of the leaders in Washington and Peking, there was in fact little that could be negotiated, and it is difficult to believe that small steps could have made a big difference unless they led both governments to substantial changes in their images or policies. We still do not know enough about the internal debates within China about foreign policy to know whether a different U.S. posture at Warsaw would have affected Chinese behavior regarding control of nuclear weapons, support for the Vietnamese insurgency, or relations with her neighbors, but one may doubt that any of these would have changed. On the American side, one needs to refer only to Eisenhower's warning to Kennedy that he would denounce him if he moved toward recognition of “red China,” to doubt that a different scenario at Warsaw would have had any real significance. Whether negotiations of a different kind, or on different subjects, or the small steps which might have come from them could have changed the misperceptions which lay behind at least some of the presumed conflict is difficult to predict.

In short, the two books provide useful data, either for a diplomatic historian's reporting on Chinese relations with the outside world, or for speculation about how negotiations affect the behavior of nations; but in and of themselves, they provide little real insight into the effect of negotiations on the events that they are about, or into U.S.-Chinese relations.

BOOK NOTES

POLITICAL THEORY, HISTORY OF POLITICAL THOUGHT, AND METHODOLOGY

Tocqueville and the Problem of Democracy. By MARVIN ZETTERBAUM. (Stanford: Stanford University Press, 1967. Pp. 185. \$5.75.)

Few books on the subject of American or modern democracy can rival the youthful Tocqueville's *Democracy in America* in profundity and comprehensiveness. So preoccupied with lesser matters are political science and education today, however, that the bulk of the work is rarely read. Zetterbaum's book, along with recent studies by

Richter, Drescher, Lively and others, should help make such ignorance less pervasive. Showing first that Tocqueville's central theoretical problem is the problem of democracy, it then reconstructs his reasonings, relates them to the problems and themes of classical and modern political philosophy, and finally evaluates them.

Zetterbaum's initial task is to penetrate beneath Tocqueville's apparent refusal either to announce in favor of democracy or to weigh democracy and

aristocracy against each other. The democratic tide is called inevitable, long-prepared, divinely-inspired. But Zetterbaum marshals impressive evidence, especially from Tocqueville's private writings, to show that he does not seriously believe in historical inevitability. He suggests that Tocqueville uses this idea to conceal his own partisanship while moderating both the democratic will to destroy and the aristocratic will to resist as they raged in bitter struggle around him. In fact, the core of Tocqueville's political philosophy lies beneath his superficial impartiality, and consists in his assessment of these two opposing regimes. Ultimately, as Zetterbaum argues, it is because he favors democracy over aristocracy in crucial respects that he can encourage his contemporaries to accept its tide as inevitable. And it is his appreciation of aristocracy that permits him to understand the nature and limits of democracy and to encourage those forces more apt to preserve and elevate it.

Zetterbaum is able to demonstrate that Tocqueville follows certain moderns in his view of the natural equality of men and in considering the active consent of the governed, or democracy, essential to the protection of the natural rights of all. As for aristocracy, Tocqueville seems in the end, but for reasons not made perfectly clear, to identify it with actual caste or inequality based on birth rather than with the theoretical rule of the best as such, and therefore rejects its oligarchic character: only democracy is capable of pursuing the common good or the good of most. Yet the heights of political and human greatness are to be found in aristocracies, not democracies, and Tocqueville reveals a fuller or more open appreciation of this greatness perhaps than any modern before him. Nevertheless, Zetterbaum tells us, he did not hope to engraft the virtues of aristocracy onto the fundamental justice and humanity of democracy. Instead, the problem as he saw it was to draw from the democratic ethos itself those qualities and correctives that might increase democracy's stature and alleviate its ills.

What Tocqueville had in mind was modern democracy, which appears, at first, to be unequivocally superior to its ancient counterpart. Without slavery it has become more just, and with larger territory and population (using representative government) it has become more stable. On the side of the ancients, however, remains their political virtue or patriotism—an "instinctive" love of country and readiness to sacrifice for it. This admirable dedication Tocqueville tries to simulate through the modern "principle of self-interest rightly understood"—*i.e.*, through enlightened selfishness.

The crux of modern democracy Tocqueville considers to be equality even more than liberty—both

of them principles already discerned in ancient democracy by Aristotle. He also apparently places a somewhat novel stress on "social condition" as the determinant of a country's politics. Equality is the social condition of modern democracy: the relation of man to man in fact as well as norm precludes fixed hierarchical arrangements, and an egalitarian political life is but one element within a more general egalitarian fabric.

In Tocqueville's portrayal, a democratic society of independent equals engenders the separateness and isolation of individuals and families, encourages each in a competitive quest for material well-being, and—while spreading compassion—drowns heroic conceptions and conduct in mediocrity. The extreme individualism of modern democracy, urging every man to examine and judge his own beliefs, Tocqueville seems to trace to the modern philosophical revolution begun by Bacon and Descartes. He fails to note, however, that the peculiar commercial or capitalistic spirit characteristic of modern democracy also has its root in modern natural and political philosophy rather than in democracy *per se*.

The problem of democracy derives from its essential egalitarianism and individualism. Because of them, democracy threatens to destroy greatness and social cohesion, and since the power of egalitarianism is ultimately greater than the power of individualism and liberty, democracy can turn into despotism, and may even do so without appearing to. Not only does the influence of public opinion dominate both masses and educated alike, but the tendency of democracy is increasingly to make the state, viewed as a popular instrument, the main provider of equality, and well-being for all the people, especially for the poor majority. If we may interpolate, the coming of what today is called the "welfare state" will mean the extinction of independence in the electorate and hence of real freedom.

To offset these existing and prospective ills, Tocqueville wanted to find a place within democracy "... for liberty, for human excellence, for a renaissance of public virtue, and for the possibility of greatness." Zetterbaum's analysis of the way these emerge from the democratic ethos is fascinating. Thus, equality gives rise to the desire to rule oneself and hence to the necessity of cooperating with others in democratic self-rule, whether through local government or a variety of political and non-political associations. The self-care of each, properly understood, makes each man realize he best cares for himself by caring for the public good; it issues in a kind of rational or calculated patriotism. And religion, also interpreted as involving each man's concern for his own (eternal) well-being, helps restrain vulgar selfishness and provide a sense of futurity and of higher devo-

tions. Even commerce extends the self-care of the individual in such a way as to bring forth not only the solid virtues of bourgeois society but a kind of independence and energy as well.

In his last chapter Zetterbaum wonders whether Tocqueville's solutions are successful and whether even he fully believed in them. Can "self-interest rightly understood" serve as the underpinning, however far removed, of freedom, patriotism, morality and greatness? Can a nation long endure on its basis? Tocqueville had his doubts, as Zetterbaum indicates, and was partly of the opinion that freedom, the nation and virtue need, and deserve, to be loved for themselves. The reader, then, must either assume, along with most of our profession, that the proper political and extra-political institutions obviate the necessity for any high moral and intellectual qualities among the leaders and people of a democracy; or he must conclude that democracy requires an admixture of virtue in the old and strict sense, and cannot succeed without having at its foundation and in periodic renewal certain aristocratic elements (especially education) to overcome the inherent defects of the modern principle of self-interest.

In this book Zetterbaum has brought us face to face with Tocqueville's central problem only after penetrating beneath certain forms of concealment. He has not permitted himself to be distracted by lesser issues, biographical or historical; he is properly reluctant to charge Tocqueville with the sort of error only lesser minds are likely to commit; and he never presumes that he possesses, in present social science, a superior vantage point. The result is a major advance in Tocqueville scholarship. Nevertheless, one has the impression by the end of the book that certain relevant issues are left unsettled or unexplored. In part because no strict definition of "social condition" is essayed, Zetterbaum's attempts to compare Tocqueville's understanding of the relation between political and social matters with that of the ancients and other moderns remain unclear. And if Tocqueville really believes in the primacy of politics, as Zetterbaum contends, does he not damage the prospects for political greatness by the weight of his stress on social condition? It would also have been helpful if Zetterbaum had more systematically distinguished between what Tocqueville says about democracy (meaning modern democracy) and what can be said, or had earlier been said, about democracy per se. Finally, some additional attention to Tocqueville's conception of virtue, and to his overall relation to ancient and modern political philosophy is necessary before the reader can judge the claim that "... despite its novel elements, Tocqueville's program probably would not have struck even a classical political philosopher as unique. . . ."

Despite this incompleteness, Zetterbaum has gone a long way toward vindicating Tocqueville's reputation as a modern master, and thereby, we may add, toward raising the current level of discussion in American and comparative politics to within hailing distance of what it was more than a century ago. For if democracy needed a Tocqueville to explore its problems then, it is certainly in greater need of one now, and a political science incapable of sensing this has lost precisely the perspective that Tocqueville, among the moderns, is most capable of supplying.—DAVID LOWENTHAL, *Boston College*.

The Democratic Experience: Past and Prospects.

By REINHOLD NIEBUHR AND PAUL E. SIGMUND.
(New York: Frederick A. Praeger, 1969. Pp. 191.
\$5.95.)

In an early essay "On the Interpretation of *Weltanschauung*" Karl Mannheim distinguishes among three levels or dimensions of meaning in terms of which a cultural artifact can be interpreted: the "objective," the "expressive," and the "documentary." Interpretations of the first sort require us to refer the artifact to the standards and criteria of the *genre* to which it manifestly belongs; "expressive" interpretation involves an account of motives and intentions; and "documentary" interpretation sees the artifact in relation to more general patterns of social and cultural developments, it proceeds, in short, in the way that historians normally proceed with documents—as evidence about the way the world was at a time and in a place. There is a strong presumption that a review in a scholarly journal will operate at the first level of meaning: appropriate canons of theoretical adequacy will govern the interpretation and assessment of a book. That presumption cannot be overridden, I would imagine, in favor of the second level. If there is nothing worth discussing about a book except the intentions of the author and the personal needs satisfied in writing it, the book does not merit review. But some books are most interesting as documents and it will happen that discussion of some books can best contribute to critical self-awareness within our discipline if it pursues that interest.

The book under consideration here falls into this latter class. There are three parts of unequal length. In the first part, Reinhold Niebuhr interprets "The Democratic Experience in Western History"; in the second part, Paul E. Sigmund canvasses "The Prospects for Democracy in the Developing Areas" (within the span of eighty pages, there are chapters on Africa, the Middle East, Latin America, and Asia); and the last brief section contains a sketchy bibliographical essay in which Sigmund cites parallels to the basic contentions in the text in the writings of Robert Dahl,

Edward Shils, Seymour Martin Lipset, Harry Eckstein, and a few others. The basic contentions of the book can be quickly summarized. Speaking of the anti-Utopian proponent of democratic government, Niebuhr says:

His approach to the political order is characterized by a mature empiricism and realism. He knows that there are many forms of power, not merely one. He knows that there must be an equilibrium of social power as a basis of justice and he has developed a highly complex political organism with many forms of countervailing power. He also knows that the political authority which must establish the order of the community must be one, but that he must triumph over many forms of subnational communities to achieve this wholeness of authority and be able to speak for the whole community. (13)

The democratic experience, according to Niebuhr, involves three basic accomplishments: the creation of national units, the social and ideological constitution of "responsible individuals," and the attainment of some sort of social equilibrium. Developments in states not viewed as participants in that experience are assessed in terms of prospects for success in these regards. The perspective offered has a certain plausibility and the essays as written occasionally contain provocative suggestions, but it remains a thankless job to attempt a theoretical assessment of the argument (or to proceed at the "objective" level).

It is hard enough in any case to find agreement upon objective standards to which an interpretative essay can be held. But some guides are available. There must be a certain integrity of language. Niebuhr inveighs constantly against "Utopian" ideologies and perspectives, but constantly proclaims the "triumphs" which constitute the Western experience. Some would consider a history punctuated by triumphs as pretty Utopian indeed. The crucial term "equilibrium" is used so flexibly that there is no kind of relationship between forces which is not somewhere so designated. And so on.

A second demand often accepted as a general guide to interpretive writing is that it "orient" us to our situation, that it enable us to make the kinds of distinctions which we feel called upon to make in the course of our practical life, that it call attention to facts and forces which impinge upon us. This is a standard to which the authors appeal, I believe; but it is not a standard which can be applied without great disappointment. We get no help with the conflicts which mark contemporary prosperous nations; we get no help with their wars (it would be instructive, for example, to hear Niebuhr try to put his vigorous opposition to the war in Vietnam into the language of his essay); and we get very curious accounts of past and recent history in Germany, Katanga, and elsewhere. An attempt to encounter the book at an "objective" level involves a thankless falling

through open doors. The argument simply cannot be taken seriously in this way.

The book must be seen as a document of the time when American social science enlisted without much opposition or discomfort as an instrument of cold war policy. The genesis of the document is instructive: Sigmund had but recently completed a tour of duty with an intelligence agency when he and Niebuhr gave a joint course at Harvard almost ten years ago; Kenneth Thompson of the Rockefeller Foundation fostered a publication built upon that course; and Praeger published it. The circumstances and cast of characters are almost ideal-typical. There are nice questions about publication of this old manuscript at this time; but they are matters for speculation. The point is not any moralistic impugning of motives, but identification of a historical complex which helps us to understand the document and which is in turn further illuminated by it. Niebuhr writes:

Forswearing a utopian interpretation of our cause has the advantage of preventing disillusion and hysteria if, in the worldwide struggle, some of the nations allied with us do not reveal the resources necessary for the achievement of a healthy democracy. We will not be too disturbed by evidences of inadequate solutions to the problems of the responsible exercise of power. We will know that dictatorships are dangerous and that all irresponsible power creates abuses. But we will also know that in a world of change, governmental experiments are reversible if they are not controlled by a tight dogmatic system. (14)

It is not necessary to question the sincerity with which Niebuhr goes on to hope for a time when Communist dogmatism will give way to pragmatism and of his opposition to a crusading war; but we must note that the perspective sees only one conflict as ultimate reality and sets out to attack only that "hysteria" which could undermine the morale and unity of "our" side. The commitment expressed in such an enlistment may be defensible on rational moral grounds, as an act of responsibility. But the politics of that political and social inquiry are not longer persuasive to many and they certainly are not inherent in objective and empirical social research as such. The book is a document useful to the development of our discipline because it can be usefully studied as we proceed to clarify the relationships between ideology and theory.—DAVID KETTLER, *The Ohio State University*.

The Political Theory of John Dewey. By A. H. SOMMER. (New York: Teachers College Press, 1968. Pp. 208, \$7.50.)

John Dewey addressed himself to many of the same problems which still preoccupy us: the role of science in studying and evaluating public policy and politics, the dimensions and purposes of planning, the nature and validity of democracy, the

manner in which we identify and assess the hitherto unexpected but consequential effects of policy, and the relationship between political activity and psychological growth. Dewey can be considered a systems-builder and analyst who moved away from the black box and facile feedback loops that purport to explain causality. Insistent that we focus on the consequences of public policy, Dewey advanced into the uncertain world of multicausality, deferred effects, and uneven impact. The problems and challenges of Dewey's theory lie at this complex level.

While Dewey failed to provide a manageable set of standards for the evaluation of public policy, he promoted a temperament and method which is still relevant to political scientists. For Dewey, political analysis was more than just the advancement and study of values or the scientific examination of behavior and policy: they were hopefully to be synthesized in an effort to make the study of political phenomena both empirically based and socially relevant.

Professor Somjee in *The Political Theory of John Dewey* has undertaken the important task of examining Dewey's concepts of experience and common inquiry and relating them to democracy and planning. The author also seeks to examine the roots of Dewey's political theory and spends considerable time with several European theorists of the late eighteenth and nineteenth centuries. But Somjee, while providing several helpful insights, does not capture the dynamic quality of Dewey's thought. Somjee, who is expanding his doctoral dissertation written under Michael Oakeshott, examines the logical consistency of Dewey's theories and their relationship to both other theorists and the philosophy of science.

The section comparing Dewey with other writers contains several new interpretations, particularly the discussion on Dewey and Kant, but the author fails to draw a new perspective after he offers a corrective to earlier studies. Somjee often introduces stimulating themes without developing them. For example, he correctly recognizes that although Dewey owes a heavy debt to James, he was not simply an extension of James. However, Somjee based his conclusions on a few critical letters by Dewey and "his studious avoidance of James's principal ideas." (p. 57) It would have been informative to have explored the differences between these two American writers in a more systematic manner.

Dewey envisioned a scientific approach to comprehensive political planning. He distinguished between the application of the scientific method in the social sciences, which would lead to the expansion of knowledge, and the wholesale borrowing of scientific concepts appropriate to one field as necessarily applicable to all others, which would only

lead to a "form of absolutist logic" as the social Darwinists had earlier demonstrated. Although Somjee accepts Dewey's distinctions, he nevertheless insists that the scientific method is applicable to the study of public policy only when incremental reforms are undertaken. Comprehensive planning cannot be sufficiently "cautions, well-thought-out, and manageable," and "the harm done by any errors may . . . be irremedial." (p. 155) There are many reasons for preferring marginal change to major reorganization, but the alleged scientific integrity of the former over the latter is not substantiated here. In some situations, if only "trial-and-error" reforms are introduced, dysfunctional factors may intensify beyond a threshold where even more sweeping proposals are demanded. In other words, Somjee's "trial-and-error" reforms may lead to "irremedial" conditions.

Because of his preference for stability, Somjee offers some arresting notions about science and government. We are told that science requires a stable political system and that Dewey's program would produce an untenable milieu for the scientist. (p. 159) Part of Somjee's problem is that he does not distinguish between possible levels and areas of planning, simply juxtaposing his penchant for stability against Dewey's more comprehensive programs for change. But there are different magnitudes of change, and Somjee would have performed a substantial service had he focused on the relationship between instability and growth instead of offering postulates about political order and scientific advancement. Indeed, many of Somjee's problems stem from his decision to ignore one of the essential elements in Dewey's thought-growth. Dewey saw that what might contribute to growth at one period may endanger it at a later time. Furthermore, change entailed possible disadvantages as well as opportunities for certain types of growth, but so did the maintenance of existing arrangements. Choices between the present arrangement and other options could only be made after an exhaustive study, according to Dewey.

The task for political theorists, according to Dewey, is neither to find the totally painless way to a better society, which being an impossible enterprise means we never move, nor simply to identify the ideal polity and rush to achieve it, which means we move without any consideration of the risks or costs involved. Rather, the task is to specify the democratic values we seek to promote and the effects of programs on individuals in terms of these values. However, these problems are beyond the scope of *The Political Theory of John Dewey* and await exposition and analysis elsewhere. Professor Somjee's book can be recommended both to those who wish to find suggestive comparisons between Dewey and several of his European contem-

pories and to those who are unfamiliar with Dewey's epistemology and its relationship to Dewey's concepts of democracy.—RONALD J. TERCHEK, *University of Maryland*.

Progress and Disillusion; The Dialectics of Modern Society. By RAYMOND ARON. (New York: Frederick A. Praeger, 1968. Pp. 230. \$5.50.)

In this book, Raymond Aron identifies and examines the major forces which he sees at work in the modern world. His analytical method is dialectical, in the sense that he confronts various ideals with various aspects of reality, a method which he had employed before, particularly in *The Opium of the Intellectuals*, in which he assessed marxist ideology in the light of the conditions of industrial society, and in *Espoir et Peur du Siècle*, in which he performed the same operation for the elements of conservative ideology.

The ideals which Aron discusses, and which he regards as inseparable from modern civilization, are equality, personality (or individuality) and universality. The first two ideals are familiar; universality is less so. He seems to regard universality as the organization of humanity into a single society, "the unification of mankind on a planetary scale" (p. 165), although it is not entirely clear whether he is thinking of a common political system or of the kind of economic equality among nations which would make possible a common mode of existence.

Some of the realities against which he sets these ideals spring from what Aron calls "the Promethean ambition—the urge, to borrow a Cartesian expression, to become the *masters and possessors* of nature" (p. 216), and to which he thinks the ideals may be subordinate. This ambition has produced the science, technology, industry, wealth and bombs which condition the national and international social orders in which men struggle to attain their ideals. But hardware are not the only social facts, and the realities with which Aron confronts the ideals also include social elements which are not directly related to the Promethean urge, such as family, school, culture, race and nation.

The book is divided into three parts. Part One, entitled "The Dialectic of Equality," explores aspirations toward equality within the context of the various forms of inequalities which characterize modern societies as the result of class stratification, oligarchic aspects of the distribution of political power, racism and ethnic conflicts.

Part Two, entitled "The Contradictions of Socialization," discusses the drive for personal fulfillment in the light of the constraints imposed by socializing agents: family, school and mass media, as well as the constraints of hierarchy and discipline imposed by economic systems which are im-

pelled either by a gospel of production or the goad of competition. The theme of the second part mixes with that of the first, as Aron discusses the impact of industrialization on the family itself.

Part Three, called "The Dialectic of Universality," contrasts the unifying forces of transportation and communication, the growth of English as the lingua franca of the planet, and the common application of science and technology with local indifference to distant concerns, the jealous assertion of national sovereignties, unequal rates of economic development, and ideological conflicts both among marxist-inspired nations and between them and the democracies.

The book has a broad sweep. In an attempt to define the distinguishing features of modern society, Aron has produced a sort of inventory of the forces making for conflict and unity both within and between nations. One great merit of the work is its effort to see modern society whole, to avoid partiality of analysis. Aron's sensitivity to all the currents at work in modern society is sufficiently great to have produced this statement, written before the French revolt of May-June 1968: "The indifference which so many citizens show toward their state and their rulers in countries where there is representative government . . . probably attests to a latent uneasiness which might suddenly explode in a crisis of wild passions" (p. 128).

But the price of comprehensiveness (within a comparatively short book) is that some matters must be dealt with too briefly. I feel that this is true, in particular, of Aron's treatment of the impact of mass media on social and political behavior. Is it correct to say that even though it is now possible to convey information rapidly about distant places and events, "none of this . . . affects the average viewer or reader as much as a quarrel with a neighbor or a colleague at the office, or the fluctuations of his own personal fortune" (p. 138)? This seems to me to understate the significance of the mass media with respect to such diverse matters as the nationalization of French politics and the evolution of American attitudes toward the Vietnam war.

But for each point which one may doubt, there are many more which impress. Aron has more ideas to the chapter than most people place in a book, and there is a concreteness and a problem orientation to the book that keeps it close to our current preoccupations at the same time as it places them within the three central analytical categories which provide the framework for the book.—ROY PIERCE, *University of Michigan*.

Soviet Perspectives on African Socialism. By ARTHUR JAY KLINGHOFFER. (Rutherford, N.J.: Fairleigh Dickinson University Press, 1969. Pp. 276. \$3.00.)

Most studies on Soviet views toward Africa have revealed more knowledge about the Soviet Union than the new African states. This book is no exception. In it, the author summarizes Soviet ideological writings about African socialism between 1955 and 1964. He focuses on the ideas mainly of the late dean of Soviet Africanists, Ivan Potekhin, and on the West African states of Ghana, Guinea, and Mali. The work makes several contributions. Professor Klinghoffer has a comprehensive knowledge of Russian language sources. He points out the significance of the Cuban revolution. At least for some Soviet ideologues, the Castro take-over in 1959 seemed to foreshadow other territories in the Third World becoming Marxist-Leninist states. In his concluding chapter, the author emphasizes the ambivalent, fluid, and pragmatic perspective taken toward African socialism. Soviet support for some ideas of African socialism stemmed from African opposition to capitalism and Western colonialism. Yet, the Russian realized that most Africans refused to identify socialism with "scientific socialism," Marxism-Leninism, or the Soviet interpretations. In foreign policy matters, African leaders did not always support the USSR's position. Domestically, no African states were ruled by a highly organized, centrally disciplined Leninist party. Like many Americans, the Russians often seemed confused about the fluid African situation. They lavished most attention on Ghana, Guinea, and Mali, presumably the states most sympathetic to the Soviet position. Yet their views toward Nkrumah, Touré, and Keita changed between 1955 and 1964. Professor Klinghoffer concludes that the Soviet position toward specific African states depended mainly on African foreign policy stands, not so much on internal social structure or domestic economic policies. If African socialists supported the Soviet foreign policies, then the Russian perspective tended to be more favorable. However, the Soviet writers definitely did not show a monolithic stand. Divergencies of opinion existed between those writers expressing sympathy for the incumbent African leaders and those revealing greater hostility.

The main weakness of this study lies in its wholly descriptive nature. There is a need for more explanation, analysis, and interpretation. The book is too much a repetitious description of different views toward African socialism. Professor Klinghoffer also exaggerates the effect of Soviet ideology on African economic policies and political party structure. He over-estimates the control exercised by the single party in Ghana, Guinea, and Mali. Although citing the writings of Soviet specialist Zbigniew Brzezinski, he never mentions the revisionist work of Aristide Zolberg on African political parties. If the author had consulted Zol-

berg, Henry Bienen, or Clement Moore, he would never have implied (p. 38) that "the African socialist regimes may be sowing the seeds of totalitarianism." Lacking a comprehensive knowledge of the internal socio-political structures of Ghana, Guinea, and Mali, the author has confused ideological reality with the existential scope of power. When the "socialist regimes" can be easily overthrown by a military coup, as happened in Ghana in 1966 and Mali in 1968, then we have to assume that the single party lacks total control either to maintain the leaders in power or to initiate policies which would change social conditions. The main Soviet influence seems verbal, not organizational. Soviet and African interpretations of socialism use similar phrases. In actuality, the dominant Marxist influence came through the French Communist party and the *Confédération Générale du Travail*, not directly through the Soviet Union. Not Soviet economists but rather French economists with Marxist views have influenced some of the economic policies formulated by Guinean and Malian leaders. Greater attention to this source of influence, mainly found in former French West Africa, would have clarified the Soviet effects on Africa.

Professor Klinghoffer also does not take a too analytic view of African socialism. He tends to make misleading dichotomies about the ideas expressed by African socialists. For example, he distinguishes "parliamentary vs. revolutionary" socialists, moderate vs. radical socialists, nationalism vs. communism, and class vs. ethnic appeals. Yet these distinctions confuse more than clarify. The distinction between parliamentary and revolutionary socialists had some relevance to European states between the two world wars. Now even in Europe the revolutionaries have become part of the parliamentary system. Especially in West and East Africa there have been few real "revolutionaries" in the Soviet sense, largely because the French and British reluctantly agreed to yield political power to the African nationalist movements. Except in Algeria and in southern Africa, independence came largely through non-violent means. Moreover, the African legislatures have never possessed the power exercised by European parliaments. African power resides in the top executive leaders, the civil service, and the military. The author also does not seem to sense the relationship between class and ethnic group. He labels as ridiculous the Soviet interpretation that particular economic classes dominated the Nigerian and Kenyan states. Yet non-Soviet American scholars have made exactly this point. Relative to other states in West and East Africa, Nigeria and Kenya are rather economically well developed. Here class and ethnic ties reinforce each other; that is, particular ethnic groups have gained eco-

economic dominance and control of the government. The tensions between economic and primordial loyalties have partly accounted for the civil war in Nigeria. In short, the class and ethnic group explanations are complementary, not necessarily opposed. The same point can be made about nationalism and communism. A leader can be a nationalist as well as a communist, depending on the meaning attributed to communism. In one section (p. 175), Klinghoffer asserts that nationalism may be "a viable alternative to the development of communism in the African nations." In the conclusion, however, he implies that Guinea is headed toward some form of "national communism" (p. 247). Both assumptions depend on the definition of communism. Does he define communism economically (public ownership of the means of production), politically (total control by a Leninist party), or in reference to foreign policy matters, i.e., adherence to the Soviet foreign policy line or Soviet control of African nations through military and economic means? The meaning is not clear.

Besides the need to present a deeper analysis of the Soviet effects on African socialist policy, Professor Klinghoffer should have provided some complete explanations for the views taken by different Soviet specialists. He could have contributed greater background information about the scholarly institutes where Soviet Africanists carry out their research. Finally, the author offers no explicit explanations for the changes in Soviet perspectives toward African leaders. Presumably these changes reflect the current foreign policy line of the USSR, the changing distribution of power within the Soviet Union, the situation in the First World, and the fluid African conditions. The author mentions all these factors, but he needs to link them more explicitly to the Soviet ideological views. This information, as well as a more realistic assessment of the effect of Soviet ideas on African leaders, would have helped in transforming this descriptive account into an explanatory work.—CHARLES F. ANDRAIN, *San Diego State College*.

Political Theory: A Conceptual Analysis. By JOSEPH S. MURPHY. (Homewood, Illinois: The Dorsey Press, 1968. Pp. xii, 267. \$7.35.)

This book "is written from the viewpoint of analytical philosophy; and it construes political theory as an activity whose purpose is the clarification and explication of political concepts" (p. vii). The author seeks to analyze critically "the central and pervasive issues of political theory." This approach, it is claimed, differs from, and is preferable to, "conventional treatments," which are chronological or which focus on the institutional contexts in which political ideas arise. Dr.

Murphy is "concerned with asking if a theory is true and adequate or false and deficient," and with stating reasons for his conclusions. The issues discussed are the meaning of the term "political theory," the ethical theory of natural law, the concept of the state, the concept of freedom, the relation between natural and social science, and the problem of values.

The author notes that "theory" in the study of politics has had a variety of meanings, including theory as metaphysics, theory as a science of behavior, theory as the methods and techniques of political manipulation, and theory as ideology. He suggests that due to an absence of agreed upon criteria of meaning, political theory has been more like philosophy or literature than like physics.

Plato, Aristotle, Hobbes, Locke, Margaret Mead, Jacques Maritain and Leo Strauss are considered as exponents of theories of natural law. Some trenchant criticisms of natural law theories are presented. For example, demands justified by natural law—e.g. for equality and for freedom—may not be fully compatible, but natural law does not provide us with criteria for resolving a dispute where such demands are in conflict. Murphy is also critical of attempts to support theories of natural law by reference to alleged cultural uniformities.

Throughout his book, Murphy offers criticisms based on logic and linguistic analysis. Occasionally his objections are trivial. For example, he cites St. Paul's dictum that every man in his heart knows "the law of God, which forbids man to sin, and commands him to do what is right." He then objects that "the logic of the words 'sin' and 'doing right' is such that it seems redundant to say that sin is forbidden." (p. 55). There may indeed be redundancy, but such an observation does not take us far toward an evaluation of natural law based on theology.

Cicero, Grotius and other exponents of natural law have described the *law of nature* as a dictate of *right reason*. Reason is thought to be man's defining characteristic and the foundation of his natural rights as a human being. But Murphy notes that reason in the narrow sense of the ability to abstract and generalize by the use of symbols varies greatly among men. Why, then, does the natural law theorist not conclude that the rights of men vary as their ability to symbolize varies? On the other hand, if reason is used in its broader sense to include expressions of intelligence not based on abstractions, it is no longer an exclusive attribute of human beings. Finally, Murphy points out that nature itself "does not and cannot provide us with standards or ideals" (p. 68). The author's discussion of the ethical theory of natural law is probably the strongest section of his book.

The author devotes two chapters each to an ex-

amination of conceptions of the state and conceptions of freedom. A contrast is drawn between holistic and individualistic theories of the state. The problem of determinism is considered, as well as positive and negative conceptions of freedom. Murphy also discusses the problem of explanation in the social sciences and concludes that "the scientific method appropriate to social inquiry is not significantly different on logical grounds from the methodology appropriate to the physical sciences" (p. 242).

In the final section of the book, the author returns to the problem of the ground of values. He asserts that "we must" find a "middle way" between "complete relativism and subjectivism" and an objectivism based on doctrines "metaphysical or theological in character." Dr. Murphy cites Stephen Toulmin in support of his "middle way," which involves emphasis on human reason. Murphy maintains that "what is best may be justified by an appeal to reason and found satisfactory if it is in accordance with the facts and if it is not at variance with the rules of logic" (p. 262). The position advanced remains sketchy, however. Problems, such as what happens when two conflicting alternatives each appear rational, and the possibility that individuals may have different concep-

tions of what is rational, are not dealt with.

Faced with the admittedly difficult task of evaluating major political and ethical concepts, the author too often merely summarizes what others have said and makes some minor points of logic, while leaving the important questions unresolved. This applies particularly to his chapters on the state and on freedom. In addition to expressing his own ideas more forcefully, Dr. Murphy might have relied less on lengthy quotations and improved the clarity and organization of the book.

This book unfortunately contains numerous errors in editing or printing including misspellings, word omissions and misplaced words. There is reason to believe such errors have been made on the following pages: 86 footnote, 87 footnote, 88, 98, 101, 105, 146, 147, 176, 177—three errors, 178, 261. The footnoting on p. 67 is inadequate.

The author has demonstrated considerable ability for critical analysis. He does not offer many original ideas, fresh answers or resolutions of the problems discussed. The book, nevertheless, will be of value for graduate and undergraduate students who wish a review of the issues and ideas which concern philosophically-oriented political theorists. —MICHAEL C. STRATFORD, *Central Michigan University*.

AMERICAN GOVERNMENT AND POLITICS

The Politics of Community Conflict: The Fluoridation Decision. By ROBERT L. CRAIN, ELIHU KATZ AND DONALD B. ROSENTHAL. (Indianapolis: The Bobbs-Merrill Company, 1969. Pp. 269. \$3.95.)

This book is billed as an advanced study in sociology, but Crain, Katz and Rosenthal present a political explanation of fluoridation decisions rather than a sociological one. The study uses statistical analysis of a large number (1,181) of fluoridation case studies, reconstructed from mail questionnaires distributed to city clerks, public health officers and newspapers editors in all American cities between 10,000 and 500,000 in population. Its authors have skillfully exploited their data to present a thorough examination of fluoridation decisions and to suggest some more general hypotheses about community decision making.

The point of departure in this study is the familiar alienation hypothesis: the assertion that local referenda, fluoridation referenda in particular, are defeated so frequently because citizens use referendum opportunities to express their alienation from the local political process. Crain, Katz, and Rosenthal take a larger view, arguing instead that the choice of decision making method in a community is a more important determinant of

the decision outcome. When decisions are made administratively, they demonstrate, a "yes" decision is more likely than when the process of choice involves a referendum.

But referenda are uncommon decision devices even at the local level, so the authors next determine why some decisions are made by referendum and other are not. They show that the explanation is to be found primarily in the timidity of elected city officials. Fearful of incurring the wrath of any vocal minority, or unable to reach agreement among themselves, many local officials fail to make an early administrative decision that would foreclose the opportunity for a referendum.

Fluoridation, the authors argue, is a complex and confusing issue to voters. Thus when a fluoridation decision does reach the public debate and referendum stage it is often defeated because voters react against an unclear scheme with uncertain risks and benefits, especially if elected officials do not take a strong stand in its favor. Finally the authors suggest that there is a city type—the "participative community"—where this sequence of events is most likely to occur. Such cities are identifiable primarily by their formal governmental structure, town meeting and nonpartisan mayor-council systems being most susceptible.

Multiple authorship may account for the one serious fault of this book, its confusing shifts in explanatory focus. For most of the book the alienation hypothesis is the target of criticism; suddenly in the last chapter it is supplanted by Kornhauser's mass society theory. But the research reported here is not really a direct test of Kornhauser's thesis. First it does not deal with national level systems, as Kornhauser does, but with limited function local governments. Second, it does not examine what happens under the conditions Kornhauser posits for a mass society; rather it challenges the validity of his assumptions about accessible elites and available masses. The author's point, that the timidity of political leaders has important consequences for the operation of a political system, is weakened by centering the discussion around Kornhauser.

The authors seem to have discovered part way through their research that they were investigating a phenomenon more general than fluoridation decisions. They begin with the decision outcome as their dependent variable, but this is soon replaced by the method of decision—administrative adoption, referendum, or “no action.” Finally in the last chapter the former dependent variable, tendency toward referenda, becomes the independent variable and the explanation shifts from an analytic one to the construction of a plausibility argument for the concept of the “participative community.”

Thus Crain, Katz and Rosenthal never directly confront the alienation hypothesis in the sense that they never attempt to predict passage or failure of fluoridation on the basis of political structure. Rather they show that passage or failure is strongly related to the kind of “track” that the decision gets onto, and then that the tracking of fluoridation decisions can be explained by looking at a city's political style and structure. It is still a matter for the reader's conjecture whether the tables running decision track against other variables are not hiding relevant variations because the “track” categories are not cleanly related to fluoridation success or failure. They do demonstrate, however, that mayoral support is important for success on both the administrative and referendum tracks.

One can also be skeptical about the feasibility of the research design because of the difficulties involved in getting the appropriate outcome data. Over half of the cities in the study fall into a category labelled “no action.” In reality, this category encompasses several situations that it would be very useful to distinguish. It includes cases where a fluoridation proposal was never really articulated, cases of “non-decision” where proposals were never acted upon by the community's power structure, and cases of explicit administrative “no” decisions. These distinctions would be quite inter-

esting to examine in light of the authors' theoretical explanations, but unfortunately the data were not available.

These criticisms aside, *The Politics of Community Conflict* is generally a persuasive and appealing book. Its authors' notion that city political leaders are expected to play a legitimizing role in important community decisions is a promising piece of theorizing which deserves to be explored further. As they are aware, of course, such a study needs other kinds of data, especially the role expectations that citizens have for their elected political leaders and for other community influentials.

The book's greatest value, however, lies in its perceptive treatment of the widespread phenomenon of the fluoridation controversy. If the assertion is correct that fluoridation decisions are merely extreme cases of a wide class of local political decisions, then the authors will have done social science a valuable service by looking beyond the issue-specific features of fluoridation politics to a more general understanding of community decision making. In any case they have presented a useful critique of the individual alienation paradigm, especially as it has been used to explain behavior, and they have reaffirmed the value of system level explanations for system level phenomena such as community decision outcomes.—ROBERT EYESTONE, *University of Minnesota*.

Representatives and Roll Calls: A Computer Simulation of Voting in the Eighty-eighth Congress.

By CLEO H. CHERRYHOLMES AND MICHAEL J. SHAPIRO. (Indianapolis: The Bobbs-Merrill Company, Inc., 1969. Pp. 196. \$7.50.)

A large number of propositions concerning the antecedents of legislative votes are brought together in this book and converted into a computer program for generating simulated congressional votes. At least 84 per cent of the resulting simulated votes agree with the actual votes cast, on 21 roll calls concerning the federal role, and 27 concerning foreign affairs, in the House of Representatives in 1963–64.

The simulation program consists of two major parts. In the *predisposition phase*, each representative is assigned a voting predisposition (toward yea or nay) on the basis of his party, state, region, constituency, committees, and positions taken by the President, signers of minority reports, etc. Those representatives whose predispositions fall outside certain limits are assigned yea or nay votes, while the rest then enter the *communication phase*. Each representative who enters this phase is assigned “conversation partners,” including the President, legislative leaders, and the congressional rank and file. These assignments in-

clude a random element. As result of each simulated conversation, the predisposition of each representative who entered this phase is altered toward the predisposition of the partner. After all the "conversations," positive predispositions are converted to simulated yeas, and negative predispositions to nays.

To carry out the simulation, the investigator must code each roll call as to the types of support it is expected to receive, such as that from party, region, and constituency types. These judgments, while subject to error, are a necessary part of any such prediction; and as long as they are not based on the roll-call votes being predicted, they are not subject to fundamental criticism. But in the simulation, the investigator must apparently also estimate numerical values of several dozen parameters—contributions of numerous variables to the predisposition, or probabilities of conversation with various types of partners—and the procedure by which these estimates (or guesses) were made seems less clearly justifiable.

The assignment of values to these parameters seems a major weakness of this study, and indeed, of all simulation studies of its type, if they are alleged to be tests of hypotheses. Perhaps this difficulty can be made clearer if we compare the procedure with that of multiple regression. The predisposition phase might be compared with a regression prediction in which constituency, state, region, and leadership variables were the predictors. The communications phase might be compared with a regression in which the votes of a subset of the legislators with intermediate predispositions were predicted from the average predispositions of other sets of legislators whose votes had previously been determined, such as those in a particular party, party leaders, committee members, or state delegations.

The central point of this criticism is that methods like regression analysis (including probit analysis) permit a new estimate of the contribution of each predictor for the data at hand, or a new test whether the previously estimated contribution of a variable holds for these data. Even if methods of this type should be impracticable for a given model, it still seems incumbent on the authors of such a model to ask whether the parameters assumed are the best, or whether in fact the variables introduced are all really necessary. A hint of this difficulty is given by the results of the "just party" model, presented by the authors: for the federal role and foreign affairs votes studied, the proportion of votes accounted for correctly was 78 and 83 per cent respectively. The authors do show that certain features of the model make positive, negligible, or negative contributions, but these are gross features; these demonstrations do not provide new estimates of the numerical values of doz-

ens of individual parameters, or tests as to whether these parameters are necessary.

While the cumulation of plausible hypotheses from the literature, together with plausible values of parameters, may give the simulator a feeling that he has approximated the complex reality of congressional decision making, it violates important canons of scientific research. It risks the perpetuation of partial or qualified findings that have appeared in the literature—including, in this case, some of my own findings that will not bear the weight placed on them. It foregoes the opportunity to test and reject such earlier findings, which may not hold under new conditions. It proliferates variables that may overlap and duplicate one another (though the authors have revealed a few instances of this type themselves). An alternative would be a model with fewer contributory variables but with a possibility of testing the contribution of each one; such summary variables might result from a preliminary combination of detailed variables, using methods such as principal component analysis.

The main value of a simulation model of this sort seems to be that it *generates* hypotheses involving fewer variables than the entire model, hypotheses that may then be tested on a more restricted scale with appropriate controls. One realm in which such hypotheses may be tested is the intractable one of "power." The process by which this model separates those congressmen presumed to have made up their minds, from those presumably influenced by their conversation partners, may provide useful clues to the measurement of power and influence. A shortcoming of some power measures based on roll-call statistics is that they have treated each legislator equally as giver and receiver of influence, and have failed to separate his predisposition from his final vote. Conceivably an extension of the reasoning in this model could measure the influence given and received by particular legislators, and provide measures of power that could be validated independently.

Thus, while this type of simulation model may provide some insights as to the implications of previous findings, it provides no rigorous replicative test of these findings and cannot therefore be regarded as a tested scientific hypothesis. It is a cumulation of particular speculative hypotheses, most of which are untested on the data at hand. It may well be a source of further testable hypotheses; but its scientific value lies in this future possibility far more than in the accomplishments presented in his book. An incidental virtue of the book, however, is that it presents extensive and organized bibliographies on simulation and on legislative behavior.—DUNCAN MACRAE, Jr., *The University of Chicago*.

Selective Service and a Changing America. By GARY L. WAMSLEY. (Columbus: Charles E. Merrill Publishing Co., 1969. Pp. 259. \$2.95, paper)

This study has two dominant themes which, to be fair to reader and author, should be reviewed separately. First, Wamsley provides us an excellent case study of administrative politics; he simultaneously informs regarding the Selective Service System and instructs regarding politics in semi-invisible administrative agencies. Second, the study is an exploration of the hypothesis that the survival of an institution is dependent on how it adapts to the political culture. In short, the book has a topical theme, the Selective Service under fire, and a theoretical focus, the necessity for social structures to be consonant with cultural values. About the theoretical issue we will have more to say shortly, but first a few remarks about the book as a case study of the Selective Service System.

Wamsley has drawn a precise and informative picture, but not overdrawn it. Although his own preferences and judgments are clear—despite frequent disclaimers—they do not much interfere with the presentation. Social scientists ignorant of the workings of the selective service system, as I was prior to reading Wamsley's study, will be rewarded by the few hours it takes to read it. And, of course, there is more than just descriptive information about a governmental agency. To briefly note just two of the points I found the most interesting. The book makes clear what criteria are used by draft boards to establish, in effect, a national manpower policy. "Board decisions rest upon middle class values, a legionnaire outlook, and upon diffuse and particularistic interaction with the registrant or his file." (p. 154). Elsewhere the author points out that the potential draftee with scientific and technical skills is most likely to avoid military service. On balance, what we learn from this investigation of selection criteria is something about the priorities of a group of men who control a particularly interesting governmental agency. The Selective Service System is rivaled only by the Bureau of Internal Revenue in its ability to cut through the protective layers between citizen and government to directly affect lives. That the decision rules of this agency have seldom been subjected to public scrutiny can only astound. A study of these decision-rules tells us much about the implicit values which the U.S. lives by. (In fact, such a study may well tell us more about the "political culture" than attitude surveys.)

Another, and related, series of observations in the study puts it firmly in the tradition of the many "demythologizing" books presently being published by American social scientists. The Selec-

tive Service System has lived by its myths (voluntarism, civilian control of the military, decentralization of decisions, an intimacy between citizen and state). First political and now scholarly attacks on these myths, coupled with a more realistic account of the actual operation of the System, have begun to make vulnerable what has for decades been one of the most invulnerable administrative agencies. The book contains much that is relevant to an understanding of an institution under attack.

However, even as a case study the book is flawed in one important regard. The struggle to explain the decline of support for the Selective Service would have been eased had the author more systematically placed the mounting attack on the draft in the context of an unpopular war. There is an air of unreality about the book, as if what is happening regarding the draft is not completely a part of what is happening in civilian-military relations in this country. In fact, if anything, the inequities of the draft spearheaded the changing mood toward the military-industrial complex. Somehow this is slighted. To be sure, the author is not ignorant of what is happening. For instance, he clearly notes how a surplus labor pool combined with increasing callups underscored the arbitrariness of the manpower policy being followed by local boards. What is missing in the book is an integration of this fact into the general analysis. But this is to anticipate the second part of the review, which is about the "general analysis."

Wamsley did not just want to write a case study. He also wanted to write about institutions and culture. To do so he commits several of the worst social science sins. He reifies, he fails to operationalize, he uses theoretical constructs as if they were empirical variables, he introduces and then ignores requisite analysis, and so forth. One quotation will provide some flavor: "It is suggested that societal imperatives can be more clearly understood if characterized as political culture. Therefore, a conscription system must always seek an equilibrium between efficiently procuring manpower to defend the society and society's demands that the procurement be done in accordance with norms and values of political culture." (15) There are many, many sentences of this type—all, to the reviewer at least, somewhat bewildering. What the author is asserting throughout is that American political culture is changing. Thus, an institution which earlier was consonant with that culture, but which has not been altered, is now in conflict with cultural values and consequently is politically vulnerable. One thing only needs to be said about this type of social analysis. "Political culture" if it be a variable at all, is a global, diffuse, and macro one. It cannot be forced to do the work of an independent variable in what

is finally a causal theory. Such an attempt can only lead to reification and sentences which grow more abstract with each phrase. About political culture as an independent variable one is tempted to say, "that which explains all, explains nothing."

If one cuts through the language about "the institution's ability to achieve acceptance by relating its structure and processes to American political values," I think what the reader finds is a telling point about contemporary politics. It is a point which in its theoretical implications is more in the tradition of political sociology, with its emphasis on power and social class, than structural functional analysis, with its emphasis on societal requisites and political cultures. The Selective Service has long been under the control of the middle-class activists who control most local agencies—city councils, school boards, etc. The Selective Service therefore has been organized around the values dear to this part of the citizenry; it has allocated benefits and penalties in such a manner as to generally reward some social classes and racial groups more than others. This particular fact has become clearer to many citizens at a moment when political organization is increasing among previously disorganized citizens and when disenchantment with military policy is peaking. In short, the invisible Selective Service System managed by the paternal figure of Lt. General Hershey is now visible, thus politically vulnerable, and Hershey can no longer hide himself and his policies behind the protective shield of the invincible military. If there is a theoretical lesson to be learned about American political culture, it is not found in the obfuscating language about "structural-cultural consonance" but in the clear empirical finding that a mistake of the dimensions of Vietnam is bubbling up and will continue to do so throughout American institutions. It is this contagion effect which is the theoretically potent, if implicit, finding in Wamsley's study.—KENNETH PREWITT, *University of Chicago*.

Riots and Rebellion: Civil Violence in the Urban Community. EDITED BY LOUIS H. MASOTTI AND DON R. BOWEN (Beverly Hills: Sage Publications, 1968. Pp. 459. \$8.50.)

This volume contains a collection of 25 articles, about half of which originally appeared in the March-April, 1968 special issue of the *American Behavioral Scientist* edited by the authors. The essays are of uneven quality and the haste of preparation often is painfully evident both in the analyses and the editorial work. However, there are some important questions raised here about the causes and consequences of the recent disturbances in our cities.

It is difficult to piece together an accurate account of the actual events of the last few summers

and especially difficult to make an acceptable *post hoc* evaluation of the motives of the participants, even when they are available for interviews. As Alan Grimshaw points out in his piece on "Three Views of Urban Violence: Civil Disturbance, Racial Revolt, Class Assault," no simple explanation will do. Whatever complex of forces stimulated the events and whatever the varied motives of the participants, both moderate and militant blacks now subscribe to the racial revolt thesis and there is evidence, as Grimshaw points out, of "a growing increase in the strength of the previously attenuated solidarity between Negro middle and lower classes."

If we accept, as do the editors of this volume and most of the authors, a notion that these were primarily revolts against the system (or as Masotti and Bowen call them, examples of "civil violence . . . characterized by attacks on symbols of the political order *because* they are symbolic of that order—though in this case spontaneous and not attempts to seize state power"), then it is not much of an explanation of say that participants and their sympathizers are relatively deprived, dissatisfied or alienated. We need to know more about the nature of the deprivation and commitment to these tactics among blacks (versus more "legitimate" political behavior or even organized rebellion), so that the factors can be identified which will alleviate, cool down, or exacerbate the situation leading to unrest.

A great deal of work remains to be done on the issue of deprivation. The concept of relative deprivation assumes the existence of a reference group or base line which serves as a meaningful standard for the individual. In most studies of civil violence it is either measured very indirectly (Gurr, for example uses indices of "short-term" and "persisting" deprivation) or by means of such devices as the Cantril Self-anchoring Scale which indicates the discrepancy between an individual's definition of the best possible life for him and his actual and/or expected situation. In the latter case, the base line is clearly the person's own standards which may be determined by a host of factors such as class or race models, or expectations created by the media. If psychological deprivation plays the role assigned it by many theorists, we not only have to understand the processes which determine the mode of its political expression, but also its genesis. Both the nature of the relevant reference group and the way a person learns that he is deprived should be important determinants of the intensity and expression of deprivation. Successful revolutionary elites, in fact, recognize this fact and devote a great deal of effort to characterizing (and provoking) the enemy and members of the "oppressed" group in a way that creates and/or intensifies a sense of deprivation and guides behavior. Tactics, reference groups, so-

cial conditions, and communications networks are interacting elements in this process.

Previous research, summarized by Leonard Berkowitz in this volume, indicates that a sudden decline after steady improvement or a growing gap between rapid improvement and even more rapidly increasing expectations sets the stage for upheaval, but Berkowitz correctly points out that "a complete understanding of the violence (in America's cities), and especially the contagious spread from one city to another, requires consideration of a multiplicity of causes, all operating together." We are now beginning to accumulate good time-series psychological data which should help in refining the complex models necessary to understanding the sources (and consequences) of civil violence.

Granted that much has to be done, an indication of the possible payoff of developing complex models can be found in the chapter by Ted Gurr. The article in Masotti and Bowen's collection is an abbreviated version of Gurr's work reported in recent issues of *World Politics* and this *Review* which interested students should consult for a full explication of his position. Seven independent variables are employed to explain the magnitude of turmoil ("relatively spontaneous, unstructured, mass strife, including demonstrations, political strikes, riots, political clashes, and localized rebellions") in 114 nations from 1961-1965. Gurr uses partial correlations derived from a multiple regression using all predictors to sketch a model of the sequential causes of turmoil. He finds that

if coercive forces are large and loyal, if few facilitative conditions are present [extremist organizations, good terrain, etc.] and most important if there is no tradition of civil violence, short-term deprivation is unlikely to lead to violence. If these intervening conditions are substantially different, however, even mild deprivation is likely to result in turmoil. [In addition,] high legitimacy is an important and independent source of low turmoil.

Applying these findings to the American situation, Gurr believes that our tradition of violence, the growth of extremist organizations, and the increasing number of black Americans who seem to regard the political system as illegitimate all suggest that "turmoil will be chronic in the near future." In addition, if racial discrimination (an element of the measure of long-term deprivation) persists, then, according to Gurr, the country is likely to experience violence regardless of the state of the intervening conditions cited above since long-term deprivation has "a major direct effect on the magnitude of turmoil." If one assumes that most blacks' psychological reaction to discrimination has changed radically—they no longer see it as inevitable and will not stand for it—and that discrimination is not about to disappear, then the implications are discouraging for the near

future. If Gurr's model is basically correct, inaction should have severe long-run consequences. The political problem, of course, is that positive governmental programs often create short-term problems and have a mixed effect on legitimacy since they anger many whites because of perceived governmental favoritism toward blacks and at the same time raise expectations in the black community well beyond achievements. Faced with the prospects of competitive mobilization within the two racial communities, leaders are tempted to do nothing during their own tenure or play to the sentiments of the large minority of angry whites.

It is very important to stress the fact that Gurr's findings have implications for whites as well as blacks. Many whites, for a variety of reasons, are also questioning the legitimacy of the government, feel that they are being deprived, and are part of our culture in which violence has been fairly commonplace. One problem which political scientists interested in public policy must examine further is that the very policies which are designed to aid blacks not only foster at least short-run discontent in the black community, but stimulate backlash among whites. The tenor of this backlash is ultimately the crucial factor in today's profound crisis in American politics.—JOEL D. ABERBACH, *The University of Michigan*.

Government Without Passing Laws: Congress' Nonstatutory Techniques for Appropriations Control. By MICHAEL W. KIRST (Chapel Hill: University of North Carolina Press, 1969, pp. 167 \$5.00)

Encompassed by the constraints of developments which have recognized the need for administrative flexibility and rules which prohibit legislation in appropriations bills, how can appropriations committees and Congress nonetheless control the activities of administrative agencies? Michael Kirst has found that they have come to rely on nonstatutory techniques, primarily appropriations hearings, reports accompanying bills, and debates on the bills.

In this study Kirst raised a number of questions: 1) what are proper areas of committee control, 2) how and under what conditions are non-statutory devices effective control techniques, 3) why are they employed, 4) are there any "dangers" inherent in their use, and 5) does the use of these devices assure the committees' meeting their proper roles? The questions constitute a mixture of normative (1, 4, 5) and explanatory (2, 3) concerns toward a particular policy.

In a somewhat syllogistic style of analysis Kirst finds it proper for appropriations committees to be involved in both broad substantive policy and administrative details of that policy. For one, they are already affecting policy by setting agency fund

levels and conditions for spending. Further, legislative committees have failed, through disinterest or inability, to exercise close control over policy. Because some Congressional group must assume responsibility, it is proper that appropriations committees step in. It necessarily follows that control over administrative details is necessary to control broad policy. Committees are thus free to utilize nonstatutory techniques to control both policy and administrative detail, and any evaluation of these techniques must be in the context of their contribution to these ends. At all times, however, the committees' use of these techniques must be under the ultimate control of the parent house. This is a practical justification where one easily gains the impression that the purpose of the argument is to establish the legitimacy of an unrestricted study of the techniques, rather than a legal/constitutional inquiry. Otherwise we would expect Kirst to address himself to a development which he mentions on the next to last page of the book—that legislative committees are indeed demonstrating greater interest in oversight of policy through the requirement of annual authorizations (over 35 percent of the money in the President's 1967 budget was subject to annual authorization). Does this development reduce or eliminate the propriety of appropriations committees' involvement in substantive policy?

Kirst attempts to answer the remaining questions by drawing on earlier writers (e.g., MacMahon, Wallace, Huzar), by analyzing the printed Congressional documents relating to appropriations bills (hearings, reports, and *Congressional Record* debates), and from interviews with some committee members (6) and clerks and departmental budget officers.

In a style similar to Wildavsky's and Fenno's studies of appropriations politics (eclectically utilizing quotes from the printed record to illustrate or establish his point) Kirst demonstrates the delicateness and subtleties involved in nonstatutory control, both during hearings and in reports, where carefully developed language serves as a code guide to agency behavior. Agencies must learn this code and calculate the risks in failing to adhere.

Committees assure congruence between their language and agency behavior by asking questions at next year's hearing, investigating, inserting legal restrictions in the bill, and cutting budgets. The effectiveness of these sanctions depends upon internal agreement among subcommittee members, the political clout of the subcommittee, agreement by other Congressional sets, and whether the control attempt conflicts with broad administration policy.

Appropriations committees resort to nonstatutory techniques to overcome and satisfy the constraints cited at the outset of the review. Because

they are not legally binding it affords the committee the opportunity to express its wrath while making it possible for the agency to disregard the message if later circumstances justify. Mutual accommodation harms no one. The devices also make possible committee initiative in policy areas without incurring points of order and questions during floor debates. Does all this not serve to allow appropriations committees to operate unchecked? No, for the entire appropriations process serves to confirm or dilute a control attempt made at one point. An "instruction" by the house committee, if not repeated by the Senate or conference report, or if countered by sufficient commentary during floor debate, could lose its mandatory character in the eyes of the agency (if not in the eyes of the originator). Kirst's overall evaluation is that the legislative body has the opportunity and has demonstrated both the willingness and capacity to control its committee. In light of this guarantee Kirst concludes that nonstatutory techniques should not be surrendered as long as they continue to serve to meet the proper role of the committee.

The principal problem of the book is that Kirst attempted to simultaneously serve both evaluative and explanatory objectives in a brief space using a broad general descriptive research and reporting approach that served neither objective adequately nor sufficiently. We are not provided with a systematic empirically arrived basis for his evaluations. More hard data are necessary to support conclusions from which policy evaluations can be made. First steps must be taken, and the problem of the book is also its virtue. Kirst has taken a successful first step in this area. Our understanding of the use of nonstatutory techniques has been deepened by this study.

To this reviewer then, the contribution of the book rests not in its normative treatment for Kirst's policy analysis is not very powerful nor convincing, but in those chapters where he describes the processes and behavior related to the use of the techniques. It is here where students of the appropriations process and executive-legislative relations will find a useful addition to the literature. Further, while Kirst appears to eschew systematic analysis of quantified data himself (the only table in the book and his commentary may provide evidence why), the possibilities for pursuing interesting theoretical and policy questions related to nonstatutory techniques in such a manner are evident. It is hoped that a number of readers will peruse this volume to explore the comparative research possibilities latent within. Following such research an evaluative study of the nonstatutory techniques policy could be more convincing to political scientists.

The reader should also be alerted to some dis-

quieting features of the book resulting in part from editing carelessness in updating and expanding a dissertation for publication, and in a tendency to repeat points and footnotes which creates a "deja vu" feeling. This tendency can be attributed to the organization of the book rather than to any attempt to stretch the research input.—JAMES E. JERNBERG, *University of Minnesota*.

The Negro in Third Party Politics, By HANES WALTON, JR. (Philadelphia: Dorrance & Company, 1969. Pp. 123. \$4.50.)

Professor Walton's study of *The Negro in Third Party Politics* fills a very significant and irritating void in the literature of American political parties. Although, as he readily admits, there have been two books published in the general area, neither of these go beyond the Negro and the Communist Party.

The Negro in Third Party Politics is a brief but fact-filled historical account of third-party activities affecting the status of the American Negro. It is divided into two major periods—pre- and post-Civil War—with major emphasis upon the post-Civil War period since it was only after the Civil War that the potential "Negro vote" began to appeal to the major and minor parties. In his discussions of the pre-Civil War period, Professor Walton concentrates on the slavery policies of the parties and attempts to assess the impact of these parties upon the abolition of slavery. The anti-slavery parties, (the Liberty Party, the Free Soil, the National Liberty Party, the Political Abolition Party), he concludes, aided in the eventual abolition of slavery by publicizing the evils of slavery. The pro-slavery parties (the Nullification Party, Southern Rights Party, the Native American Party, the Know-Nothing Party, the Constitutional Union Party) inadvertently aided the anti-slavery forces by making slavery "a primary political issue . . ." and thereby sharpening "the factional rivalry in both major parties over it."

The post-Civil War section is devoted to the policies of third parties as they relate to the achievement of "full citizenship" by Negroes. The theme which seems to emerge from this section is that the Negro vote, particularly since the end of the Civil War, has been almost constantly misused. It is not clear whether the author intended to project this theme. Nevertheless, the data offered clearly demonstrate that all too often the Negro has been used as a pawn in the game of power politics.

Many examples of the misuse of the Negro's voting strength occurred during the period following the Civil War when Republicans, because of fear of the consequences of restoring home rule to the South, guided the Negro vote. As the author points out, "many devices were used by northern

soldiers, agents of the Freedman's Bureau, and the Union League, to see that the Negro voted properly, i.e., for the Republican Party."

A more recent example of attempts to misuse the Negro can be taken from the experiences of the Union Party of the 1930's which "was a coalition of Father Charles Coughlin's 'Social Justice' followers, and the followers of Senator Huey Long's 'Share the Wealth' movement. . . ." Prior to the 1936 elections the Union Party openly sought the support of Negro voters by calling for an end to discrimination against anyone because of color. It was obvious that the Union Party was attempting to deceive Negro voters. The attempted deception was so obvious, as Professor Walton points out, that the "N.A.A.C.P., in an editorial, urged Negroes to 'beware of Coughlin and anyone he supports.'" In case after case the data suggest that in many instances third parties, like the major parties, have used the Negro vote for their own selfish gains without regard for the welfare of Negroes.

In addition to providing an excellent history of the Negro and third party politics, Professor Walton has assembled an admirable political history of the American Negro in that he has gone beyond merely stating the various positions of the minor parties as these affect America's most oppressed minority. He has additionally recounted in some detail many political episodes directly affecting the Negro. One example of these political episodes is Professor Walton's interesting discussion of Theodore Roosevelt and the question of seating Negro delegates from the North and the South at the 1912 National Convention of the Progressive Party.

In spite of the many positive features of this study, it does suffer from one major shortcoming—the apparent lack of information about contemporary "all-Black" third parties. It may well be that these parties will become the vehicles through which the Negro will make felt his newly-found political power. In view of this possibility, any study of the Negro and third party politics should place considerable emphasis upon "all-Black" third parties.

The Negro in Third Party Politics is a very readable study of a most interesting topic. Every serious student of American political parties must become acquainted with this work.—EDWARD JACKSON, *Southern University*.

Planning and Politics in the Metropolis. By DAVID C. RANNEY. (Columbus: Charles E. Merrill, 1969. Pp. 179. \$2.25.)

David Ranney has done students of urban politics a service by synthesizing much of what we know about the relationships between physical

planning and city politics. His book converts much of the best knowledge garnered from modern political science and planning theory, at both the city and metropolitan levels, into an integrated text. That the task has been done by a planner and not a political scientist is auspicious since up to the present, concern for the politics of planning by planners themselves has been rare.

Ranney discusses the variables current research indicates are critically relevant to planning action, in terms of Banfield and Wilson's notion of the city as having service and conflict management functions. What the planner recommends is categorized as the "service" aspect of planning policy decisions. This is effected by the attitudes of the planner, the type of planning agency a city has, the nature of federal policies and metropolitan jurisdictional divisions (only the Department of Housing and Urban Development loves the metropolitan planner); and the kind of political system the planner confronts. How the political system reacts to the planner's proposals (the "conflict management" aspect of planning) depends on the kinds of planning policies pursued, the values the community holds about the functions of government, the role of the planner, the distribution of power among various segments of the community (less important in the long run than is generally believed), and the socio-economic characteristics of the city.

Ranney also describes what planners normally do and touches base on new developments in the planning profession which are occurring as it begins to lose confidence in its ability to make the environment better for urban dwellers. He traces the movement from urban physical to social and policy planning and more recently, to advocacy planning.

There is more specificity about factors affecting planning than about the outcome whose variation is examined. This is because a thesis central to the book is that planning is not an end state but a process. While Ranney describes the activities in which planners engage, he believes it is incorrect to regard planning as producing a master plan or capital improvement program. Planning is instead the series of actions and reactions occurring from the time a planner makes a set of recommendations to the time when political actors determine what to do about these, plus feedback.

Ranney offers hypotheses about how each category of independent variables affects the service and political functioning of planning. The weakest discussion is that on the impact of socio-economic factors. Ranney says environment influences planning but is unable to specify how. Is this because of a dearth of studies? Or is it that planning actually does operate in a partial environmental vacuum? Other categories are richer, and simulta-

neously, more open to challenge. For example, Ranney says that great political participation in planning means a less cheerful prospect for the original plan. This reflects the notion that the more citizens participate in local affairs, the greater the chance of conflict and hence the lower the level of performance. And, Ranney adds that if a community is made up of groups which subscribe to a "public-regarding" ethos, planning activities will have a better chance of achieving their aims than where "private-regarding" views dominate. This reflects the view that planning serves a middle class definition of the public interest. Recent research indicates that neither of the hypothesized relationships holds without qualification in other policy areas: indeed, the more groups and actors participating in current decisions, the higher the level of outputs sometimes observed.

The possibilities for argument over explicit hypotheses are an indication of the strengths of the text. It is where such argument is foreclosed that its weaknesses lie. Ranney gives us statements about relationships within categories of variables but among categories he has given up the good fight. Yet it is in the interaction among the variables that the most compelling issues now lie. If a primary resource of the planner is his technical expertise and expertise needs to be linked to action, what costs are incurred when the technician plays politician? Given that planning in different territorial subsystems is a different process, in which is role more important than organization, and in which is community type most significant in predicting outcomes? And, is there any combination of variables which allows us to link city planning to changes in the quality of urban society in the current era of community revolution?

In part it is Ranney's conviction that planning is a process and not an output measurable by expenditure indicators and completed plans, in part his sensitivity to the diversity of communities engaged in planning, and in part the state of the source literature, that makes him hesitant to weight variables or enumerate interaction rules. This position is certainly intellectually respectable. But I for one would like to know how Ranney, who has read all there is to read about city planning and its politics, guesses particular causes act in producing particular consequences, and evaluates the work on planning that has been done.

It is useful to have the variables affecting city planning enumerated and explored. But the effort runs the risk of committing that great crime—irrelevance—when it stops short of discriminating among variables or asking if existing definitions of and research on planning are not marginal to the conditions of urban life in 1970. Of course, the writer who walks out on a limb well beyond exist-

ing studies runs the risk of being called irresponsible. The dilemma is Ranney's, but hardly his alone.—FRANCINE N. RABINOVITZ, *University of California, Los Angeles*.

Education and Politics: The Developing Relationship Between Elementary-Secondary and Higher Education. By MICHAEL D. USDAN, DAVID W. MINAR, AND EMANUEL HURWITZ, JR., (New York: Teachers College Press, Columbia University, 1969. Pp. 190. \$6.50.)

Educational goods and services are one of the more socially significant as well as expensive outputs of the political systems of modern societies. But until very recently the politics of education was a virtually unknown domain of political scholarship and research. As a result, we now know relatively little about the politics of education in a period of history when the political significance of education is rapidly expanding. Happily, a growing number of political scientists as well as professional educators are now turning their attention to the study of educational politics. In a few cases this is a collaborative effort that blends the particular interests and skills of the educator and political scientists. Such is the case with *Education and State Politics* by Michael Usdan, David Minar and Emanuel Hurwitz, Jr. Minar is a political scientist with a long-time scholarly interest, as well as some practical experience, in the politics of education. Usdan and Hurwitz are professional educators who combine an experience in several kinds of educational roles with considerable background in the academic study of politics. The result of this collaboration is a short book which should prove useful to both the educational politicians and the academic scholar seeking to understand changing character of the politics of American education.

The book, as its sub-title indicates, focuses upon the relationship between elementary and secondary education on the one hand and higher education on the other. It begins by noting that historically the American education system as a system through which "the country's resources are allocated and organized for education" has been highly fragmented. Not only has the system been fragmented across levels of government and between different units at each level, it is also fragmented in the division that historically has separated elementary-secondary and higher education. This boundary, which was once accepted as so natural as to warrant little comment, is now being eroded as a result of a variety of socio-cultural changes, including the expanding cost of education, growing skepticism about the effectiveness of many established educational forms and procedures including the traditional divisions between grade levels, and the growth of demands for new

educational services such as programs in vocational and adult education that overlap the traditional provinces of the schools and the universities and colleges. There is now emerging, the authors argue, a slowly integrating overall educational system in which the traditionally separate and partially isolated levels of American education are becoming components of a single system in which traditional relationships of mutual isolation between the schools and higher education are giving way to relationships of collaboration and conflict. This book is an effort to describe and to evaluate these emergent relationships in order to develop answers to three general categories of questions: (1) What forms are the changing relationships between elementary-secondary and higher education assuming? (2) What processes are affecting the relationships? (3) Why do these forms and processes differ as they do from state to state?

The authors attempt to develop answers to these questions by doing two things. First, using data obtained from interviews with relevant decision-makers, the analysis of documents, and reading of press accounts, they construct "profiles" of the relationship of elementary-secondary and higher education in twelve selected states. These descriptive profiles, which evidence an admirable degree of comparability, seek to describe in abbreviated form the organization of education in each of the twelve states, the critical issues involved in inter-level relationships, and projections about the future of these relationships.

Secondly, using these profiles and the larger sets of data from which the profiles were constructed the authors develop a comparative analysis of what they term to be "some major elements" in interrelationships of pre-collegiate and collegiate education. This analysis is focussed upon patterns of inter-level conflict and cooperation. Cross-state differences are noted and analyzed in terms of a range of factors which might partially account for or explain variable patterns of conflict and collaboration. These include the changing structure or character of major interests in educational politics, e.g., the growth of militant teacher organizations; the formal structure of educational government, e.g., elected vs. appointed state board and/or superintendents; the structure of state political systems; the character of the issues involved in inter-level relationships; and the socio-economic environment of state educational systems.

The book concludes with a brief outline of policy recommendations. Given the fact that the schools on the one hand and universities and colleges on the other are no longer isolated organizations but rather components within a single system of educational politics, the future of inter-level relations is one of either intensified conflict over scarce resources and alternative educational

policies or one of expanded inter-level cooperation. The authors note that while they are by no means committed to an ideology of conflict-free politics, on the whole they are "pushed toward the conclusion that inter-level coordination in education is a desirable, if not essential, step" if the states are to develop a capacity for rational planning congruent with the educational needs of the times. They argue that expanded cooperation is not likely to come about as a result of "natural" accommodation among traditional interest groups in education, nor are governors or legislatures currently equipped to bring it about. There is a need, they argue, for the creation of "new overall coordinating mechanisms."

In conclusion it should be noted, as the authors freely acknowledge, that *Education and State Politics* is not a complete study, but rather, as they put it, a "pilot study," an attempt at "analysis of a subject that deserves much more attention." This is true, but the work is nonetheless a very valuable contribution to the gradually expanding literature on the politics of education. Beyond this, it is an example of scholarship that seeks to use social science in order to describe, analyze, and evaluate a significant social problem and then present the resulting product in a literate way.—LEE F. ANDERSON, *Northwestern University*.

The President and the Management of National Security. EDITED BY KEITH C. CLARK AND LAURENCE J. LEGERE (New York: Frederick A. Praeger, 1969. A Report by the Institute for Defense Analyses. Pp. 274. \$6.95.)

Scarcely two decades have passed since the Congress expressed its intent, in the National Security Act of 1947, "to provide a comprehensive program for the future security of the United States; [and] to provide for the establishment of integrated policies and procedures for the departments, agencies, and functions of the Government relating to the national security. . . ." Both the internal and the external settings have changed enormously, but in the wake of that change, three key creations of the Act, the National Security Council, the Central Intelligence Agency, and the Department of Defense, have come to play significant roles in the decision-making process related to national security.

The present study, sponsored by the Institute for Defense Analyses, omits the background history and developments leading up to the National Security Act of 1947. It concentrates on the National Security Council, proceeding directly from a premise that "if there were now no NSC, something very much like it would have to be created." Far from focusing exclusively on organizational structure and mechanisms, however, it ranges over the broader ramifications of the deliberate effort

to create arrangements for policy planning. A major effort is made to point out options, within existing legislation and institutions, that might improve the national security process.

Because each President has used the NSC in his own way, its actual role and responsibilities have varied widely. Nevertheless, a clearly discernable contrast between the "formalized-codification" approach of the Eisenhower administration and the pragmatic or *ad hoc* approach of the Kennedy and Johnson administrations provides the underlying theme throughout the report. Since neither administration adopted one process to the exclusion of the other, and since outward appearances can be most deceiving, the several authors attempt to get behind the more obvious differences in presidential style by drawing on interviews (not cited directly) with nearly one hundred government officials who hold or once held, key positions in the White House or in main departments and agencies involved in national security affairs. A conscious effort is made *not* to evaluate substantive performance. Instead, national security policy is treated as something like a management tool; concentration falls on the "process implications" and the relative effectiveness of each method.

Probably the most authoritative and comprehensive discussion of the national security process yet printed—and certainly the most up-to-date—this is a timely study in a number of respects. At the beginning of any new administration there is always a good deal of speculation as to the direction it may take and the dominant forces that may emerge within it. During his presidential campaign, Mr. Nixon stated that he intended to restore the NSC to its preeminent role in national security planning. He also attributed "most of our serious reverses abroad" to the Kennedy and Johnson administrations' "inability or disinclination" to make effective use of President Eisenhower's National Security Council format. President Nixon's frequent references to meetings of the NSC (and the apparent frequency of the meetings themselves), his sanction for assembling the largest and most elaborately structured NSC staff in history, and his appointment of Henry M. Kissinger as Special Assistant for National Security Affairs all indicate a significant role for the NSC, at least for the next three years. Is this an explicit reversal of the Kennedy-Johnson approach to policy formation? Is it something more than a reversion to Eisenhower's techniques? Does it represent, through rescinding NSAM 341, a rejection of the former's effort to strengthen the policy role of the State Department? What is the future of interdepartmental operations characterized by the Johnson administration's Senior Interdepartmental Group and the subordinate Interdepartmental Regional Groups (SIG/IRG)?

Answers to these and similar questions will fascinate students of national security policy formation for years to come. Mr. Nixon was very firm in stating, during his campaign: "This [National Security] Council was established by law to integrate our diplomatic, military and economic policies. It was our assurance that America would not aimlessly drift in world affairs but would control and direct their course." Reviving or redirecting the influence of the NSC, however, is but a beginning step. There has been speculation that Mr. Kissinger may be more a staff assistant and less a policy maker than his two predecessors, Bundy and Rostow. It has been reported that Mr. Nixon will reestablish the NSC's Planning Board and Operations Coordinating Board (OCB), and that he will reemphasize the extension of planning through the State Department's almost moribund Policy Planning Council. While it seems likely that there will be less emphasis on the "proliferation of papers" that characterized the Eisenhower years, and less of the free-wheeling decision-making by White House assistants, the Report draws attention to more fundamental "pressure points" which must also be considered: the general eclipse of the State Department and implications of a White House-centered system for national security; the changes in the Department of Defense and the impact of the "McNamara Revolution"; and the constant search for basic policy guidelines that will not unduly circumscribe the president's flexibility of action. In the last analysis, it will be the interplay of personalities and mechanisms that determines the over-all character of the Nixon administration's approach to national security matters, and in this context, the authors' caveat bears repeating: "The force of personality of the President and his principal advisers will have a more important influence on how major decisions are reached than will the organizational procedures that have been set forth."

In the IDA Report, we are given a valuable framework within which to consider the trend toward a national security system. Unlike many efforts involving a number of authors, the quality and style of the various sections is of consistently high calibre. The effort to achieve objectivity has created certain minor problems: discussing the subject as an abstraction (without getting into substantive matters) has produced a sense of bland detachment; too many issues are resolved into apparent dichotomies and then bridged by a catch-all "middle range of choices" category; finally, the text suffers from a certain homogenized quality—it is a sober, methodical presentation which leaves one longing in vain for an element of strong conviction, approval, outrage, or even subtle humor. At any rate, the issues are presented with clarity and precision. The elegance

and style can be found among the references cited in the excellent bibliography.—HERBERT F. STEEPER, *University of Massachusetts*.

Traffic and the Police: Variations in Law-Enforcement Policy. BY JOHN A. GARDINER. (Cambridge: Harvard University Press, 1969. Pp. 176. \$6.00.)

Social scientists are beginning to give systematic attention to the police as critical actors in the distribution of values. After years of lamentable oversight, many social scientists seem to be following the lead of journalists, novelists, civil liberties attorneys, and assorted others who have worried over the importance of the police in the urban world. It may be that the various presidential commissions have acted as important catalysts for this new, or at least greatly expanded inquiry. In commissioning papers, hiring consultants, and so on, the presidential commissions may have turned some academic priorities around, even if they have failed to turn the nation's priorities around. Perhaps one should take what comfort one can.

While much of the recent literature by political scientists, about police, has been theoretical speculation, often concerning critical policy issues, empirical research is beginning to appear. One early product of this newer scholarly interest in the police (not apparently related to any presidential commission incentive) is John A. Gardiner's *Traffic and the Police*. This valuable little book is an intensive examination of police traffic-ticketing behavior in four middle size Massachusetts cities, supplemented with a survey of state and national data which presents corroborating evidence. The study has the principal objective of accounting for the widely varying patterns of enforcement of traffic laws. In particular, Gardiner tries to examine the degree to which police ticketing practices are explained by police departmental variation (policy of chiefs, existence of traffic divisions, departmental norms and incentives to write tickets, etc.), and the degree to which they are explained by demographic, political, or judicial characteristics of the city (court disposition of tickets, local accident rates, standard demographic measures). Gardiner's evidence, substantial but perhaps incomplete, is that police departmental variation, and particularly the priorities of the police chief, are much more important than anything else, in accounting for the variation in enforcement.

Writing this review in Chicago, it is superficially easy to short-change a study of police traffic ticketing behavior as of relatively minor importance, compared to other researchable questions about the police a political scientist might examine. Gardiner's research appendix acknowledges the importance of data availability in the choice of his subject, and he sticks quite close to his data. Yet, police ticketing behavior may be a clue to other po-

lice behavior, as the author notes. Surely in efforts to understand the parameters of police discretion and the nature of street corner justice, research into police norms generally, and the responsiveness of policemen to central direction, is critical. But many of the useful insights in the book must be mined, for the author did not elaborate on such questions himself. Gardiner's analysis of the inability of public reaction to influence policy, due to a total lack of public knowledge about what police traffic enforcement policy might be, plus his discussion of the inequalities in traffic law enforcement, is of substantial importance.

The combination of intensive description of police behavior in four cities, with a supplemental survey analysis, is no longer unique in its combination, but it is still notable, both as a multiple method enrichment of the findings, and as a more broadly enlightening format for presenting a case. The particular combination effort in this book is not without problems. The four Massachusetts cities intensively studied are Cambridge, Waltham, Lynn, and Malden. Cambridge and Waltham are the highest ticketing cities in the Boston area, while Lynn and Malden are the lowest. This is a useful finding, incidentally, for traveling academics. Critical to the whole analysis is a presumption that the incidence of traffic violations is a constant, across cities, so that variation in ticketing is a product of varying police behavior. This presumption, as Gardiner describes it, seems plausible, despite conventional wisdom (1) about who commit traffic violations (the young), and (2) who disproportionately live in the high ticket university towns of Cambridge and Waltham (the young). Gardiner rests his presumption on the substantial variation in traffic law enforcement within cities, over time. This is plausible, but the presumption is not substantially tested, even though indirect indicators of incidence seem possible. One can agree that wide variation in traffic tickets per thousand motor vehicles clearly shows that ticketing practices are not *solely* a reflection of variance in the commission of traffic offenses, but still suspect that it may be partially such a reflection.

A difficulty with the study, not entirely handled, is the perennial problem of generalizing from a small, non-randomly selected set of cases—four Massachusetts middle size cities—to a wider population. The analysis of state and nation-wide questionnaire returns, plus the secondary analysis of other national data, does buttress the case findings. But some of the key traffic ticket practices in Massachusetts seem so exotic and unlike practices in most areas of the United States that they seem likely to be the product of a particular state or regional political culture. I doubt if the semi-legitimate, and near universal "fixing" of tickets by Massachusetts police chiefs has many parallels.

The benefits of doing comparative study within a single state—accessibility, similarity of formal organization, similar traffic laws, etc.—still leave problems in this study. Note that the survey data were not used to test hypotheses originally generated from the comparative study of four cities. The hypotheses were tested in the four cities, and this analysis was partially broadened and reexamined in the survey analysis. So the problem of the generality of the four city findings is important.

The relative ease of access to police chiefs and policemen, plus the high response of the national survey of police chiefs to a mail questionnaire (75%), indicates that social research into police activities is quite possible. The secondary use of state and national traffic data also suggests that such sources can provide much of use for social science endeavors to measure and account for police behavior.

Gardiner has marked out important questions, and provided valuable leads. His conclusions seem tenuous and rather narrow. With the obvious centrality of the police to the contemporary urban crisis, I hope the author, and many others, will pursue these matters.—H. PAUL FRIESEMA, *Northwestern University*.

Employer-Employee Relations in Council-Manager Cities. By WINSTON W. CROUCH. (Washington: The International City Managers' Association, 1968. Pp. 137.)

Work slowdowns, mass sick calls and strikes by public employees are now occurring with a frequency thought impossible a few years ago. Sanitation workers, firemen, policemen, teachers, transit workers, nurses and social workers have all recently articulated grievances through direct action. Less publicized but more important over the long run is the organization of public employees into voluntary associations and unions. Winston Crouch has examined the present development of and attitudes toward municipal employee organizations in a selected group of council-manager cities.

Most of the data presented in the study were collected through a mail-back questionnaire sent to the total universe of city managers serving cities of 10,000 or more people ($N = 914$). Replies from 623 city managers (68%) were included in the analysis. The questionnaire was designed to elicit information about the following: (1) an inventory of unions and local associations; (2) the city manager's perception of community attitudes toward the organization of municipal employees; (3) officially expressed local policies regarding city employees' political and organizational activities; (4) city management practices relative to employee organizations; and (5) the

manager's opinions about employee organizations.

Analysis revealed that metropolitan cities, rather than suburbs and independent cities, and the New England and East North Central areas were the mostly heavily organized. The International Association of Fire Fighters, the Fraternal Order of Police, and the American Federation of State, County, and Municipal Employees were the associations that enjoyed the greatest success in organizing municipal employees. Only 5% of the cities had more than three associations organizing their work force while 39% of the cities had no employee organizations at all.

Two major impressions conveyed to the reader by the book are that employer-employee relations have not been an issue of major importance in the past and municipal officials have reserved judgment about the role and contributions of employee organizations. Crouch reported that two-thirds of the council-manager cities had no formal policy regarding employees joining employee organizations. In one-fourth of the cities having employee organizations no organizational spokesman was involved in discussing with management such basic matters as wages and salaries, only 17% maintained signed agreements with employee organizations, paid professionals functioned as representatives in 10% of the cities, the union shop was accepted in 5%, and arbitration was used sparingly.

City councilmen, city managers and the community at-large were for the most part neutral in their attitudes toward employee organizations. City managers in over 50% of the cities reported that councilmen had given no clear indication of attitude toward employee associations. The managers had no unified attitude toward employee groups or to their role in the administrative process. Aside from organized labor relatively few community groups seemed to speak consistently (pro or con) on the subject.

The major observations made by Crouch were: relatively little organization had taken place among municipal employees aside from police and firemen; council-manager cities had done little to regularize procedures for dealing with employee groups; few cities have had serious work disrup-

tions but the number was rising; community interest groups, other than organized labor, had shown general indifference to employee organizations; and city councils and city managers had not formed a definite judgment about employee organizations.

However, the research strategy that produced these findings should be viewed critically. Even though city managers are centrally located in the administrative process, asking them to report on the attitudes of councilmen and community organizations has some serious shortcomings. The spate of community power structure studies over the past decade and a half certainly demonstrates that to whom you address your question largely predetermines your answer. Would the same observations about employer-employee relations have resulted if councilmen, labor leaders, and community activists had been included in the survey? Certainly it is not surprising to find city managers opting for neutral type responses when asked to comment on the opinions and attitudes of others.

A few other minor points should be noted about the study. First, in several sections of the book relationships were referred to as being statistically significant. However, the reader is not informed as to the statistical treatment afforded the data nor the probability level accepted as representing significance. The reader is also due an explanation as to the reason any test of significance is used since the data were drawn from the total universe of council-manager cities and not from a sample. Second, the absence of a summary chapter in the book is unfortunate. The various lines of inquiry pursued were not woven together in any kind of final summing-up, thus necessitating the reader to do some of the author's work.

Overall, the monograph makes a needed addition to our knowledge of an issue-area of local government that will most assuredly grow in importance. As other researchers initiate new inquiries into municipal employer-employee relations this study will inevitably become a base point against which new insights and findings can be measured and compared.—SCHLEY R. LYONS, *The University of North Carolina at Charlotte*.

COMPARATIVE GOVERNMENT AND POLITICS

Modernization by Design: Social Change in the Twentieth Century. By CHANDLER MORSE, DOUGLAS E. ASHFORD, FREDERICK T. BENT, WILLIAM H. FRIEDLAND, JOHN W. LEWIS, DAVID B. MACKLIN. (Ithaca: Cornell University Press, 1969. Pp. 426. \$11.50.)

A volume promising cross-disciplinary studies

by representatives from several social sciences on a common topic such as modernization is typically a euphemism for another loose-jointed non-book, something one sees all too often. This collection is decidedly not of that class. It represents an important effort on the part of scholars from the fields of political science, sociology, economics, and so-

cial psychology to focus on problems of the modernization process facing "late modernizers," i.e., twentieth century efforts by new nations to "... augment their wealth-creating power . . ." Of course, the product is not as uniform or consistent as the work of a single author might be, but the results clearly justify the hazards of cross-disciplinary work.

Four areas of interest to political scientists and political development specialists are touched on. First, the essays provide useful discussions of bodies of literature relevant to the study of modernization, some familiar and others relatively unexplored. Specifically, the essays examine social parameters restraining leadership in the modernization process, attitude change, institutional change in terms of role proliferation and differentiation, the role of public administration, interaction analysis, and the relationship between economic and social analysis. Second, the chapters illustrate the utility of working at all levels of social analysis. Ashford treats the individual unit of analysis focusing on how individuals come to perceive new values and relate them to institutional change. Macklin, building an interaction model joining the individual and social levels of analysis, argues cogently that modernization entails significant changes in institutions, but that these changes depend in turn on changes in the psychological dimension. Freidland traces the role proliferation and increasing formalization of institutional arrangements that occur as modernization progresses. Lewis stresses the importance of leadership, but in terms of the constraints imposed by the social forces which structure, at least in part, the responses open to modernizing political elites. Morse, after a perceptive critical review of classical and neoclassical approaches to economic growth, argues (and I believe him correct) that "... economics as we know it in the West is not concerned with the problems of basic institutional change and has nothing to say about them." He begins the task of rectifying this omission by relating economics to all possible aspects of institutional and revolutionary change. Third, as promised in the introduction, the essays are concerned substantively with the crucial distinguishing characteristics of premodern and modern societies and the ways in which premodern societies were transformed into modern societies. Finally, the authors are not content with theoretical discussions, each chapter includes a section on the policy relevance of their perspective for development strategy worth serious consideration from foundation and government people concerned with development.

Although a reading of any or all of the essays would be very productive, the long chapter by Morse stands out as an extraordinary model of creative yet systematic and precise writing in the

nexus between economics and the rest of social science. Morse accomplishes this by being rigorous when possible and open-ended when the situation calls for it. For instance, he critically presents aspects of "replicative" (premodern), classical, neoclassical, and progressive economic growth as they relate to basic institutional change (the heart of modernization for Morse) in a succinct but elegant manner using symbolic notation where useful. Next, he examines institutional change in general viewing institutions as "... ideas, concepts, symbols, rules, statuses, relationships, and so on . . ." Essentially, institutions may be considered the parameters of social action. He examines the modernization implications of institutional change at the cultural, the organizational, and individual psychological levels. Radical or revolutionary internal change emerges as the crucial determinant for successful modernization. Simply put, any social scientist concerned with modernization should read this essay.

The authors, particularly Lewis and Morse, ignore implications of their own analytic sections when making their development strategy remarks. The evidence accumulated by the authors points to the massive structural difficulties facing elites attempting to modernize now. Lewis identifies the problem as that of diverting leadership structures in modernizing countries from their initial highly ideological thrust to more "rational" involvement in productive processes associated with economic growth. Lewis observes that ideology provides an initial substitute for social cohesion but should be subsequently moderated so that leaders can "think contextually" in order to engage successfully in the development process. Lewis correctly identifies the dangers of ideological emphasis for the long term development process. However, the weight ideology must bear as a substitute for social cohesion may be of a higher order than Lewis admits. Lewis implies that the Chinese Communist leadership may be faulted for not softening their ideological thrust and thus may be blamed for the large internal disruptions in the 1960's. Yet it may well be all the Chinese elites can do to keep the ideological network, the substitute for social cohesion, and hence the social system in being given the social structural stresses brought about by the impact of modernization. Morse argues the case for sustained revolutionary leadership to bring about the institutional change necessary for successful modernization. Again, his own analysis equally implies that cycles of political leadership instability will proliferate as men ineffectually grapple with social forces beyond their control. Of course, this question involves theoretical assumptions about the role of political leadership and few of us are willing to argue that social forces such as those accurately described in this volume render

men impotent. However, evidence continues to mount that the intensity which telescopes factors associated with the modernization process provides current political leaders with difficulties of a much greater scope than we have been thus far willing to admit.—ROGER W. BENJAMIN, *University of Minnesota*.

Partiti politici e strutture sociali in Italia. EDITED BY MATTEI DOGAN AND ORAZIO MARIA PETRACCA. With a preface by Alberto Spreafico. (Milano: Edizioni di Comunità, 1968. Pp. 660. L. 5,800.)

An increasing interest in Italian politics is reflected in a number of excellent publications in English ranging from John Cammett's study of Gramsci through various studies of political behavior—Barnes, Blackmer, Di Renzo, Evans, La Palombara, Tarrow—to works dealing with communities in the process of change—Cornelisen, Lopreato, Paulson.

Two major themes emerge from these writings. On the one hand the theme of underdevelopment and development as played out in Gramsci's central concern with the *Mezzogiorno*, in Tarrow's focus upon level of development and party strategy, and in Lopreato's attention to the transformation of Southern Italy from a peasant to an urban society.

The second theme, reflecting perhaps an American over-concern with left-wing parties has been the emphasis given to the study of Italian communism.

It is against the background of these overriding themes, development and communism, that the present work rings its changes. While the book suffers from the same kind of eclecticism that characterized an earlier monumental study by Spreafico and La Palombara, *Elezioni e comportamento politico in Italia*, it does provide the student of Italian politics with a series of detailed studies which compliment the work done by non-Italian scholars. In this sense it should be considered alongside other studies such as the publications of the *Istituto Carlo Cattaneo* dealing with political participation in Italy. (Cf. Vittorio Capocchi et al., *Il comportamento elettorale in Italia*. This REVIEW, 63 (June 1969) 589-590.)

The point of departure of the present study of political parties and social structure is the general election of 1963, though the intended focus is to explore the relationships between political behavior (almost exclusively expressed here through electoral data) and social structure. Spreafico, in the preface, concedes that the work does not present an organic synthesis but rather a problem orientation reflecting various methods and approaches.

The work is divided into six sections—Prolegomena, Influences, Migrations, Dynamics, Eco-

logy, and Elites—and perhaps the most useful service this reviewer might be able to perform for the interested student of Italian politics is to summarize the hypotheses and conclusions of some of these rather uneven articles.

Perhaps the most interesting sections in this collection are those dealing with "Migrations" and "Dynamics." The former consists of a review by Gian Franco Ciaurro of the fourth phase of Italian emigration and more specifically the continental European character of this emigration. Thus between 1960-61 almost 1½ million Italians migrated to the Common Market countries, to Switzerland and Britain, while the transoceanic migration during the same period consisted of only 260 thousand. Equally impressive is the fact that 300 thousand of the Europe-bound migrants returned to Italy in 1963 to cast their votes in the national election. (An interesting sidelight here might be the use of "unobtrusive measures," i.e. increase in railway travel during electoral periods, to study migratory politics). The second aspect of the "new migration" is of course the internal migration which Ciaurro discusses in the light of the social and political integration of the Southern migrant. It is here that the study by Domenico De Masi and Giuseppe Pranzo analyzing demographic shifts in Milan as a center of immigration is particularly useful. After an imaginative and careful analysis involving such variables as demography, electoral results 1946-63, electoral dynamics of the individual parties, distribution of the parties in various zones of Milan, geographical origin of voters, socio-economic conditions prevalent in various zones of Milan, etc., the authors conclude that it is impossible to draw unequivocal causal relations about immigration and political behavior in Milan. They grudgingly acknowledge that the Southern workers seem to vote Communist because they are workers rather than because they are Southerners. A socio-economic analysis becomes more important than a cultural one. In a similar vein Ciaurro concludes that "Neither from the electoral data, nor from other elements does it seem possible to derive a precise correlation between migratory phenomena and the voting trends of political forces other than the PCI." (351)

Under the heading of "Dynamics" the articles by Corrado Barberis and Guido Corazziari, "Economic structures and electoral dynamics" and that by Mattei Dogan, "A phenomenon of political ataxia" furnish detailed material for the further exploration of the Benjamin and Kautsky hypothesis. The fundamental question raised is to what extent do electoral shifts result from economic change and how does one explain the gains made by the PCI. Dogan's conclusion: "In Italy, the needle of economic development continues to be pointed to the North star. While the migratory

movement goes north, communism goes south, while the country becomes urbanized communism becomes ruralized. It thus goes against the current. Society moves in one direction, communism in the other. We are thus face to face with a phenomenon which one might call "social ataxia" borrowing from biology a concept which means the pathological non-coordination of body movements." (478) It is only regrettable that the discussion of economic development and political change is not placed into the context of the earlier writings of Lipset, Cutright, and Marsh.

The first section of the collection consists of an historical overview and the essay of Paolo Ungari, "From Center-Left to Center-Right: 1958-1963," comprises essentially a historical narrative of Italian domestic politics. The author's conclusion that: "the fundamental problem of political equilibrium had almost been solved, the task now was to demonstrate the capacity for effective constitutional politics" (46) seems in the light of recent Italian events somewhat premature. Orazio Maria Petracca, "Tactic and Strategy of electoral programs" addresses itself to an analysis of the party programs as they express the aggregating functions of Italian political parties. The author's conclusions are not surprising: the party programs of 1963 tend to assume a common physiognomy which cuts across class lines, they are in the author's words "dream books." Thus the intrinsic usefulness of this particular analysis is placed into doubt by the author himself when he concludes with a sceptical quote by Benedetto Croce placing into question the meaningfulness of party programs. The article by Alberto Spreafico on "Electoral Forecasts" seems somewhat out of place in this first historical section and might more appropriately have been incorporated in the section on Pressure Groups. This is particularly so since of the four polls cited only one comes even close to following the canons of sample survey research. Two polls are in effect competitions organized by *L'Espresso* and *Paese Sera* respectively transforming electoral prediction into a kind of *Totocalcio* game. Only the CISER poll taps voter preference, the DOXA and newspaper polls are indicative of potential electors' predictions of the coming election. Therefore, Spreafico's analysis is more concerned with perception of party configurations than with electoral behavior. In predicting or expressing preferences as to the outcome of the 1963 election the overall pattern was that the estimates of DC, PSI, and Monarchist votes were overvalued, whereas the results for Communists and Liberals were often grossly underestimated.

A second section of the work, gathering together "influences" upon the 1963 election, consists of a series of articles by Prandi on the intervention of the church hierarchy, by Bechelloni on trade

union influences and by La Palombara and Gloria Pirzio Ammassari on the electoral activities of the Italian Confederation of Industry. All three essays are essentially historical in character. Prandi bases his findings on selected pastoral letters, Bechelloni eschews a sociological analysis because he claims that the necessary empirical data are missing, La Palombara and Ammassari focus on Confindustria media. Of the three interest groups, Confindustria seems to be the most enlightened reflecting an increased neo-capitalist position which recognizes, within limits, the economic and social functions of the state. In contrast the church hierarchy in no way reflects the internal evolution to the left of DC. As for the trade unions the fact that the new tendencies which emerged between 1961 and 1963 were not institutionalized, prevents the Italian unions from achieving autonomy from the parties, from the government, or from the owners.

The section on "Ecology" contains a sophisticated article by P. A. Allum on the political ecology of Naples as well as a more historically oriented article by Luciano Cavalli on social and political alignments in Genoa. It is particularly Allum's article which deserves greater attention than is possible here. A final section on elites contains articles by Giovanni Di Capua on choice of candidates and an article by Alberto Spreafico on the political composition and the social stratification of the Senate.

It is clearly impossible to do justice to fifteen articles within the compass of one review. It is regrettable that the editors did not see fit to attempt to relate the various analyses to each other and there is a frustrating lack of the authors speaking to each other. Nevertheless the work will be particularly useful to those interested in economic development and migration, as well as to that small, and passionate, band of Italophiles.—LUCIAN C. MARQUIS, *Pitzer College and Claremont Graduate School*.

Opposition in a Dominant-Party System: A Study of the Jan Sangh, The Praja Socialist Party and the Socialist Party in Uttar Pradesh, India. BY ANGELA S. BURGER. (Berkeley: University of California Press, 1969. Pp. 306 \$8.50.)

Thanks to the Ford Foundation, the Fulbright program, the American Institute of Indian Studies, the openness of Indian society and the accessibility of Indian political processes, the first generation of scholarly output of India addressed itself substantially to all-India perspectives and affairs. The second generation, equally well endowed, would seem to consist largely of monographs dealing with state and local politics. The second generation work under review supplements the Brass analysis of Congress dominance in Uttar Pradesh (1965) by focusing its attention on the problems

of building and maintaining opposition parties in a dominant party system. Mrs. Burger's book is in many ways superior to the earlier work and yet it suffers from certain similar weaknesses in approach.

The book is divided into four parts. Part one elaborates nine working hypotheses and provides context by giving a brief political history of the state. These hypotheses to be confirmed, modified or rejected fall into two sectors: those dealing with the building and maintenance of opposition parties on state and national levels and those pertinent only to the local constituency level. Mrs. Burger's most salient observations derive from her study of the latter.

An analysis of the socio-economic background and career patterns of 46 out of 48 Jan Sangh MLA's, 33 out of 38 Praja Socialist MLA's, and 22 Lohia Socialist MLA's makes up part two of the book. Parts three and four consist of six richly detailed constituency studies from which the author has abstracted her most interesting conclusions.

Though the author conducted her study from 1963 to 1964, the Indian electoral experience of the last two years seems to confirm her conclusion that opposition parties confront many of the same problems as Congress has experienced in maintaining successful local parties. "Frustration and disenchantment seem to be directed against whichever party is victorious on the local level." (275) The candidate's continued victory is in jeopardy either because local candidates cannot always alleviate the basic sources of discontent or because constituency party leadership eventually ossifies to the point that newly mobilized groups can find political expression only in yet newer—or even older—parties within the constituency or paradoxically because other candidates often seem more attractive even when incumbent candidates have not failed to obtain material benefits for the constituency.

Complicating the task of maintaining party electoral support is the problem of maintaining intraparty cohesion. The difficulties created by ideological differences, by ambiguous vertical relationships between local and state units with no fixed focal point, by the lack of a socio-economic mainstay in an extremely diverse political entity, and by the arbitrary timing of elections every five years are only partly offset by the absence of an invariable party commitment, the existence of a universal franchise, and the consequent potential for mobilizing new participants.

The problems of party and electoral maintenance are common to all political parties, but in underdeveloped countries the need for opposition has been questioned by a whole generation of nationalist leaders as being dysfunctional. Mrs. Burger argues persuasively that opposition parties in

fact assist the dominant party in the basic modernizing tasks of political socialization, recruitment, interest articulation, and aggregation, thus increasing the rate of mobilization and permitting "discontent, divergent interests, and antagonisms between groups to be publicly registered, to be directed against the dominant party and against governmental activities without being directed against the system." (283)

Accurate as the data concerning the six constituencies studied may be, sound as these arguments may be on the constituency level, intriguing as it all may be on the theoretical level, the claim for general applicability is never substantiated. On the basis of these six constituencies, which are not even necessarily representative of the whole state of Uttar Pradesh, we are informed that the observations are not only applicable to all of India but to all dominant party systems. Yet if this is truly a substantial comparative study rather than an area study one wonders why the constituencies were not chosen to be reasonably representative of the state (which in itself is peculiarly complex) if not the country, or why, at the very least, the author appears to have conducted her study in a vacuum, ignoring the work of people like Nayar or Wallace in Punjab, Sisson and Shrader on Rajasthan, and a number of excellent studies done on other states. In the same way, many of the author's other conclusions (the tendency for newly mobilized groups to reject opposition parties in favor of identification with the governing party and to be welcomed therein as a means of maintaining dominance, for instance) might also have been confirmed and strengthened by reference to a number of studies including those mentioned above. Some modest reference to complementary work in the field of Indian politics (if not world politics) might have gone far in solving the problem of the great inductive leap from specific to universal.

Unfulfilled pretensions aside, however—and I stress the point only because the temptation of grandiosity is now so seldom resisted, this book is an excellent study of an important subject. It suggests a great deal about the problems of party building and maintenance in underdeveloped areas and it seems quite authoritative in so far as it concerns six constituencies in Uttar Pradesh.—STANLEY A. KOCHANEK, *The Pennsylvania State University*.

L'Abstentionisme électoral en France. BY ALAIN LANCELOT. (Paris: Armand Colin, Cahiers de la fondation nationale des sciences politiques 162, 1968. Pp. 229.)

After the 1960 American elections, so the story goes, a small group of political hucksters undertook to peddle an aspiring Presidential candidate

for 1964 with the claim that he would attract to the polls a tidal wave of alienated citizens who had been so dissatisfied with the "me-tooism" of previous candidates that they had refused to vote at all. They supported this claim by comparing the valid votes cast for President in 1960 with the size of the voting-age population and by assuming wishfully that the difference represented a politically-homogeneous mass sympathetic silently to their candidate. The electoral disaster they produced is only the most conspicuous testament to the lack of information about and understanding of the non-voter. Political scientists have been no less remiss than practical politicians in perpetrating idle myths about non-voters.

Alain Lancelot's exhaustive study of non-voting in France comes as a welcome and illuminating departure from the usual conjecture and prejudice. Professor Lancelot has left unturned very few stones, substantive or methodological. Going back to 1815, he estimates the volume of non-voting in France and subjects to rigorous analysis the many slippery problems that arise in defining, measuring, and evaluating electoral abstention. Then, in the distinguished French tradition of Siegfried and Goguel, he spreads his hatch marks across the hexagon and discovers that with non-voting—as with nearly everything else—France is two countries, split somewhere near the Loire.

In that section of his study, he makes a statistical calculation that offers an easy opportunity for someone to check out the marginal value of computers for political science. He seeks to learn the extent to which the changes in the volume of abstentions across time (1876–1965) varied among *départements* and admits that the obvious method for determining this would be to "calculate a coefficient of linear correlation between each consultation." But, he "recoiled before the number of computations that would have required." Instead, he calculated the comparative rankings of the *départements* for the periods 1876–1914, 1919–1936, and 1945–1962. Colleagues who are more friendly with computers than I am tell me that the operation he rejected as too gruelling could be performed quickly and easily by computer. One wonders if M. Lancelot's study would have been more exact if it had been computerized.

Following his general study of the relationship of geography to abstentions, M. Lancelot makes detailed studies of the 1936 and 1946 elections and the 1958 and 1962 referenda. Then, he analyzes the effect of "political" factors on non-voting, both the political context of the consultation and the political attitudes of the abstainers. Next, he examines the relationship of various biological, economic, educational, occupational, residential, and religious characteristics of eligible voters to their tendency

to abstain. Finally, he attempts to determine the extent to which the non-voting part of the electorate is stable. Are most non-voters consistently in that category or do they bob in and out, responding to highly individualized stimuli?

As one reads the Lancelot study, one is continuously impressed by the large number of interesting questions about non-voting that deserve serious examination. Who are the non-voters and why? How do they affect the operation of political systems? How do they affect the balance of political power? Furthermore, even a rudimentary knowledge of research resources suggests that non-voting should be at least as easy to study as voting. Most election rolls are open for public examination and indicate clearly who failed to vote. Often, they also provide such information as address, occupation, age, date and location of previous residence, party registration, etc. With very little effort, the serious student of electoral behavior could analyze these data to discover correlations. Also, he could identify non-voters and interview them to learn their motivations, level of information, etc. As non-voters in most elections are much less numerous than voters, his task would be less formidable than if he were studying the voters.

Yet, Lancelot's study is the first general work on the topic. Why have so few scholars been interested in the topic seriously? One hopes that interest hasn't been lacking because of a too-facile willingness on the part of many political scientists to accept the old myths about "apathetic" and "alienated" voters. In fact, field study has shown repeatedly that official sources (at least in the United States) tend to exaggerate the number of non-voters. (An excellent recent example is Kurt Lang and Gladys Engel Lang, *Voting and Non-Voting*, Blaisdell, Waltham, pp. 73–80.)

Indeed, the most striking conclusion to be drawn from the Lancelot study is that non-voting is an extraordinarily complex phenomenon. His research indicates that categories of voters who are well integrated in society tend to abstain less than those who are poorly integrated, but poor integration may be no more than residence in a high Alpine valley from a decent road and farther still from the polling place. He identifies an equally large category of abstainers who are prevented from voting by factors at or beyond the limits of their control, i.e., illness, travel. Finally, he shows clearly that the character of the election affects turnout appreciably. Even these generalizations conceal great variations and contradictions. No category of the electorate that he sets up is wholly exempt from abstentionism and the differences between categories are usually quite marginal.

The student of voting behavior will find much

valuable information in the Lancelot study, though he should be very cautious in using it to support generalizations that purport to explain non-voting. Also, his data are very questionable when he moves outside France, especially with respect to the United States. That, however, is not his fault, but the fault of American political science for not doing for the United States what M. Lancelot has done for France.—WILLIAM G. ANDREWS, *State University of New York, Brockport*.

Political Change in Contemporary France: the Politics of an Industrial Democracy. By HARVEY WATERMAN. (Columbus, Ohio: Charles E. Merrill Publishing Co. 1969. Pp. 256. \$2.50.)

As a frame of reference for his analysis of French politics, Harvey Waterman draws upon existing theoretic statements offering explanations of the dynamic of industrialized western nations. Having quite adequately summarized the basic conclusions of the literature, he synthesizes and sets forth the following thesis: with industrialization comes affluence, a breakdown in class distinctions, a lessening of traditional cleavages and a decline of ideological dogmatism and conflict. In sum, industrialization and affluence are said to induce inevitably a decline of ideology and a consequent growth of political consensus and stability.

In spite of occasional contradictions and too heavy reliance on impressions, Waterman's rapid review of French political ideologies, style, partisanship, participation and protest affords him the following set of conclusions: There is today an openmindedness in French politics and a willingness of organized groups to cooperate with one another. There has been a decline in ideological rigidity in France with fewer people seeing in political parties, a comprehensive view of society. Dogmatism and exclusiveness within the society have declined and with them political cleavages have dissipated. Fewer people are voting on the basis of the religious categories of the past, but rather on the basis of increased knowledge heightened by an ever growing interest in politics. With this has come an increased tendency to discuss particular issues and to accept compromise in preference to either stalemate or conflict. The people of France are no longer demonstrating an intolerance of governmental institutions, even those of the Fifth republic. There has been a tendency on their part to view government as providing legitimate mechanisms for incremental change and the realization of economic and social goals. Consequently, the political maturity and stability of an industrialized France is asserted.

Waterman runs into difficulties on two levels: first, his argumentation tends to be spotty, uneven and often weak; second, his methodology seems to have caused an over-idealization, and perhaps an

oversimplification of the current state of French politics.

A large part of the case built by Waterman is set forth in his discussion of the decline of traditional political ideologies: Marxism; Socialism; Liberalism; "Political Catholicism" (he should have said Catholicisms); "Radicalism and Gaullism" (both in one page); "The Extreme Right: Ultracisme (sic) Algerie Francaise, Nationalism"; Nationalism; "Europe." The problem is that he is not dealing with "Ideology" but with political movements. At the outset, Waterman indicated that the "decline of ideology" must be viewed in terms of a movement along a continuum from one extreme, that of the profusion and adherence of many to comprehensive, articulated world views, toward the other, that of less formalized yet coherent value structures which guide behavior influencing orientations, perceptions and evaluations. But in the main body of the book it is not the doctrine but rather the political movements which are discussed. It is the feeling of the reviewers, for example, that the ideology of the French communists can not be understood simply by recounting the shifts and moves of the Communist party. The fact that Duclos did not advocate communism in the last presidential campaign is no more convincing a demonstration of the decline of ideology than Thorez's *main tendue* to the Catholics twenty years ago. And Guy Mollet's zig-zags (together with so many others) on the issue of laïcité neither proves nor disproves anything at all. In the same sense the chapter on Political Partisanship is quite disappointing. Except for the period of the Resistance and that immediately following the liberation, a period when there were but three parties each paying lip service to the slogans and ideas of the "left," an extremely "ideological period," we doubt that the French would have shown any commitment to their political parties at any time in their republican history in spite of what Waterman might suggest. Aside from this the author misses the point by giving less than a page to the political clubs and but a bit more than a page to the PSU.

The explanation for what we perceive to be an over-simplification of French politics, is to be found in the author's somewhat uncritical application of the "decline of ideology" theory. Having indicated in his second chapter that most "generalizations about behavior are based on studies made in the United States," he goes on to accept *in toto* their applicability with the assumption that "all such nations [industrialized, western nations] are in many respects very similar" and that the researcher might therefore "use whatever scholarship comes to hand." But Waterman is not alone in his failure to foresee the violent uprisings of May-June 1968. What is interesting is that

he felt compelled to write an apologia in the form of an Epilogue. It was not necessary. Nobody expected a movement of violent revolt to occur. But because the traditional ideologies of the 19th century were on the decline there is no reason and there was no reason to believe that the end of Ideology had come.

In the interstices of our industrial society, big, complex and rich (but not so easy), men and women continue to search for the basic value systems that will satisfy them. In so doing, they not only abandon and reject the ideologies of the past (which are indeed on the decline) but seek new values that are expressed in new forms, even if they appear to us to be apolitical, that inevitably shape behavior. This is not a mass phenomenon; it is not a political one; it cannot be easily reflected in surveys. It is initiated by a small group of intellectuals and students (Waterman discovers in his Epilogue a student subculture). Perhaps the time has come for the Clerks to atone for their Treason!—ROY C. MACRIDIS AND THEODORE SCHELL, *Brandeis University*.

Responsible Government in Ontario. BY F. F. SCHINDELER. (Toronto: University of Toronto Press, 1969. Pp. 295. \$3.50.)

Although a case study in the sense that it concerns only the government of a single Canadian province, this book is addressed to the more general problem of how British-model parliamentary institutions can be maintained in modern industrial society. Specifically the author is concerned with the threat posed to the continued viability of parliamentary institutions by a current imbalance of power that favors the executive over the legislature. Schindeler's study of Ontario government during 1945-65 is not an historical one, but of necessity, part of the book is given over to a description of the development of responsible government in the province and to a delineation of other relevant political institutions. The work, it should be noted, also is comparative and theory-relevant and has the additional merit of being lucidly written.

In Schindeler's view, two features are especially important in understanding the Executive's domination of Parliament in Ontario: the short legislative sessions and the tendency toward one-party dominance. Having diagnosed the situation, he suggests a cure, or, rather, a number of "reforms" that are likely to have an ameliorative effect. Not unexpectedly, these include the provision of more research assistance for back benchers and committees, adequate office and secretarial services for members, access to information stored with the bureaucracy, greater opportunity for legislators to participate in the policy initiation and evaluation processes, and more effective employment of

current procedures such as the question period. He also suggests lengthening the legislative sessions and re-organizing legislative business so that more effective use can be made of the House's time at the beginning of a legislative session.

Schindeler claims that his suggested reforms and innovations would "completely change the style of government that currently holds sway in Ontario." (p. 271). Through them the Government would be made "responsible for its actions, not necessarily to the legislature . . . but to the people who would at least be given some basis for assessing the performance of the Government before casting their votes." (pp. 271-272). Given the low level of interest in politics and the lack of political information that generally characterize Western democracies, and the fact that recent empirical studies suggest that Canada is even a less politicized society than the United States, such a claim may reflect wishful thinking rather than the real world of Canadian politics. In part, the author recognizes this in that he realizes his suggested reforms and innovations constitute a necessary, albeit, not a sufficient condition for achieving truly responsible government. This is, however, a very minor short-coming in a very good and careful analysis of an important problem. Schindeler's study will be especially welcomed by students of federalism and of comparative politics since it is one of the few systematic studies extant to legislative institutions at the sub-national level.—ALLAN KORNBERG, *Duke University*.

The Affluent Worker: Political Attitudes and Behaviour. BY JOHN GOLDTHORPE, DAVID LOCKWARD, FRANK BECHHOFFER AND JENNIFER PLATT. (Cambridge, Britain: Cambridge University Press, 1968. Pp. 95. \$5.50.)

The background to this study is the fall in the vote for the British Labour party in the 1950s. People interested in the fact that Labour lost three successive elections tried to account for it in a variety of ways. Some suggested that manual workers who had traditionally been voters, were now dropping their loyalty to Labour because of increasing wealth. It was, as we shall see, a vague theory although the problem for the Labour party was real enough.

At the beginning of their study the authors declare "The main objective of this study was to test the widely accepted thesis of working class embourgeoisement: that is, the thesis that as manual workers and their families achieve relatively high incomes and living standards they assume a way of life which is more characteristically middle class and become, in fact, progressively assimilated into working class society" (page 1). The volume under review deals with specifically political aspects of this hypothesis namely the at-

titude of affluent workers to the Labour party. They conclude "We find that a large and stable majority of our workers are supporters of the Labour party, even though there are signs that in many cases this support is of a rather 'instrumental' kind. This leads us to a discussion of the view that affluence is a factor leading to the decline in Labour loyalties among the working class. . . . Finding little evidence in support of this idea, we then turn to consider two other possible sources of influence on the voting behaviour of the affluent worker . . . a worker's white collar affiliation and trade union membership. Both these variables are associated with our workers propensity to vote Labour." (p. 1). So much for the statement of aims and their summary of their findings.

An immense amount of work has gone into this study of which we are promised four volumes. The question is whether they were studying a real problem and whether they went about it in the correct way. I believe that the answer to both these questions is, no. I shall take them in turn.

The authors study a group of 'affluent workers' in Luton in order to test whether *embourgeoisement* has taken place. Although the general idea of this process may be fairly clear any research worker must define it somewhat closely before he can claim to have confirmed or disconfirmed it. My first complaint is that this is precisely what the authors have failed to do. They admit to this. "Our study does not allow us to make as thorough an investigation of affluence as would be desirable to test the affluence thesis decisively. We have noted that this thesis itself in some respects imprecise and would need clarification and refinement in order to be tested in any definitive way. However, since we ourselves do not embrace it we shall leave the task to those who do." (p. 46). But four volumes and a half a dozen papers seems an excessive mileage to get out of something which does not even claim to be definitive test. How can the authors claim to have tested a proposition in any sense when by their own admission they do not know what they are testing.

The one hard finding which they seem to have is that Labour support among the affluent working class in Luton is extremely high. Somehow this seems to be a disconfirmation of the "affluence hypothesis." So it may be but only when it is related in some way with a measure of Labour support among manual workers who are not affluent. We are not offered this type of comparison. Instead within the group in Luton those earning more than £18 a week are compared with those who are making less. This is really not very satisfactory since we are told at the beginning of the volume that they are all "affluent." In any case the effect of social context and community might very well be such as to make even the more poorly paid dif-

ferent from groups of equivalent income in other less affluent locations.

The authors do not, however, stop at this in their study of the possible effects of greater affluence. They ask a series of questions, which are supposed to divide middle and working class respondents. In three of the four questions the response of the majority of manual workers is the same as the response of the majority of a white collar control group. In the fourth question the manual workers are very evenly balanced. The authors admit that this constitutes some evidence for the *embourgeoisement* hypothesis but once again the only way in which this data could have been made really meaningful would have been in comparison with a sample of workers who were not affluent. Again the authors find that their affluent workers have what they call an "instrumental" attitude towards the Labour party. By this they mean that when asked why they support Labour a large percentage answers in terms of the Labour party giving a better deal for the working man. Is this really a test of an instrumental approach? The fact that a worker verbalises his reason for supporting the Labour party in terms of its use to his class really has to be supported by other sorts of evidence. "The party of the working class" is at least as much a symbolic statement about Labour as an expression of self interest.

In the long run they conclude, as we have seen, that affluence is not important in determining loyalty to the Labour party. White collar affiliation and trade union membership are much better predictors of Labour or non Labour voting. This is shown quite clearly but on the other hand this does not prove that affluence is unimportant. It is fairly widely accepted that white collar affiliation is an important cross pressure for the working class. Indeed the authors could profitably have gone into it in more detail. Its full theoretical implications, which are extremely important, are not spelled out. Their data about the relationship of white collar affiliation and trade union membership is used to prove that when they are taken into account the relationship with affluence disappears. But in pages 57 to 59 where they try to prove that the effect of affluence disappears when other factors are taken into account, they control on the wrong variable.

I now turn to some final statistical criticisms of the study. In the first place the authors use what they call a critical sample. This device is thought to form the basis of a test such that "if, in the case studied, a process of *embourgeoisement* was shown not to be in evidence, then it can be regarded as extremely unlikely that such a process was occurring to any significant extent in British society as a whole." (Page 2). They argue that Luton constituted just such a case. Here for var-

ious reasons which they outline was the "affluent" town. But how can we say that Luton is the perfect test case for the embourgeoisement hypothesis when it is by now clear that no one has quite defined what this hypothesis is. We are given some rather vague information about Luton but nothing which compares it with other areas. Above all there is simply not enough argument in favour of this unusual research strategy of "the critical sample" to make it sound even vaguely convincing. How are we to know that some distorting factors may not be at work in Luton. At least with a more widely selected sample we might have been able to allow for "community effect." But worse is to come.

The authors agree (page 84) that their is not a random sample of the electorate. It is therefore not possible to generalise even to the population of Luton. It deals only with certain occupational groups within three firms and among these it only deals with men (not women) who are married and who are between 21 and 46. As a sample of any kind of the working class population this is beginning to look extremely odd. Of this sample, however, no less than 19.6% refused to be interviewed (page 5). What effect this might have upon the analysis can only be guessed. The authors make it even more difficult to guess by giving us no idea of who these refusals were. Indeed the whole methodological description, apart from the somewhat tendentious discussion of "the critical sample" is so brief as to be almost useless. They do not even publish their questionnaire. One is led to suggest that their data is in rather a bad state or at any rate there is little evidence to give us confidence in it.

One last comment is in order. Throughout the entire book not one statistical test is used. Given the fact that they were not using a probability sample it is understandable that they find simple measures of association inappropriate. On the other hand multivariate statistics would certainly have been in order to look at the relation between the various dimensions. The fact that they have not been used is a sad comment on the extent to which British sociologists are able to cope with the tools which are readily available.—JOHN BRAND, *University of Strathclyde*.

Guatemala, la Violencia. COMPILED BY ALEJANDRO DEL CORRO. (Cuernavaca, Mexico: Centro Intercultural de Documentacion, CIDOC, 1968. Vol. I, PP. 114; Vol. II, Pp. 135; Vol. III, Po. 435. Obtainable by subscription to the CIDOC Dossiers.)

What makes a political order breakdown into widespread violence and civil war? To answer this classic question, political scientists are currently turning to comparative quantitative analysis, but

the detailed studies of individual cases are also needed. One of the most interesting, but tragic, recent cases has occurred in Guatemala where internal dissension and violence ascended to a peak in 1967 and 1968 of a virtual war of all against all, without, however, having the attention-gathering result of an overt U.S. intervention or a communist takeover. Neither U.S. scholars nor press have fully reported the situation, let alone analyzed it, but the Intercultural Center of Documentation in Cuernavaca, Mexico, has advanced the study immensely with the publication of three volumes of bibliography and documents. To my knowledge, no similar collection has been published on any other case of civil war, revolution, or widespread violence.

The shorter first two volumes contain bibliography and reprints from Guatemalan newspapers, principally *Prensa Libre*, *Impacto*, *El Grafico*, and *La Hora*. The third and longest volume contains a bibliography and the reproduction of documents "of difficult acquisition." Included are statements by Guatemalan groups of every ideological orientation. Many of the pieces were originally only mimeographed and circulated clandestinely. Others were circulated publicly as handbills. One item is a thorough and detailed history of the rebellion to 1965 by an unnamed foreign source.

None of the documents presents a sufficiently complete description of the events to allow an assessment of the severity of the Guatemalan violence in comparison with other contemporary breakdowns in public order. However, enough material is given to indicate that insecurity was complete in all the non Indian communities of the country. In these areas, no one of any class or occupation, official or unofficial, was safe from assassination and mutilation, seizure and torture, or blackmail. Strangely, the most oppressed group, the 60 per cent of the population composed of unassimilated Indians, refused to become involved. No lines between organized fighting forces were drawn. The rebels machine gunned police or shot up "traitors" in the center of Guatemala City. In retaliation the "anti-communist" unofficial groups or the secret police dragged persons from their homes, tortured them, and left their bodies in the countryside. At the same time guerrilla bands roamed the country and were pursued by the army who struck against anyone who might have collaborated.

Many different perspectives of the violence are found in the documents. The rebels, the moderate political parties, the governments, the army, and the rightwing groups have different descriptions of the facts, and varying interpretations of the causes of the violence. The total impression of the different pictures together is baffling, but it may give a better representation of the reality than would

any single "objective" interpretation. The collection certainly precludes any simplistic or one-sided interpretation of the events.

To add to the confusion, groups continued to change their views over the years in which the violence occurred. The communist party, *Partido Guatemalteco del Trabajo*, for instance, began by opposing the rebellion and accusing the participants of being ultra-radicals and irresponsible "provocateurs," but it ended by giving its wholehearted support to the guerrillas and encouraging their partisans to renewed efforts after the tide had turned against the rebellion. The original rebel forces split, and one of the original leaders, Luis Turcios, accused his former comrades of Trotskyism. The Catholic Church went from a rigorous anticommunist position to opposition to all violence but in favor of social change. The intense anti-communist propaganda and terroristic campaign of the right wing groups, MANO, NOA, MNL, CEDEG, came into being only after the elected government of the *Partido Revolucionario* assumed office in 1966 and sought some sort of accommodation.

These volumes could be well used as readings for students with ability in Spanish instead of the bland statements so often used. They provide enough material for numerous political analyses at all levels of scholarship. Most important, they contribute to a more profound understanding of one of the most critical issues of all times, the breakdown of public order. The contents deserve to be far more widely disseminated than is possible under the subscription system of CIDOC dosiers.—JOHN F. McCAMANT, *University of Denver*.

Technocracy. BY JEAN MEYNAUD. Translated by Paul Barnes. (New York: The Free Press, 1969. Pp. 315. \$12.95.)

Ever since the dawn of industrial society, students of politics have been concerned with the question of the relationship of technical expertise and democracy. But although the problem of the expert is as ancient as Plato, it is only in modern times that the technical specialist's claims to superior insight have been generally accepted. In recent decades the difficulty of reconciling the knowledge of the minority and the power of the majority has become so intensified by the growth of science and technology as to give birth to what is virtually a new field within political science, the study of the interrelations of science and politics.

France has long been a polity in which a centralized state has made maximum use of technical expertise, and there has been a widespread tendency to refer to the Gaullist regime as "technocratic." Therefore a book on technocracy by one of France's most distinguished political scientists inevitably holds out the promise of shedding new

light on a central problem of modern politics—the impact of science upon democratic government in advanced industrial societies.

For these reasons Professor Meynaud's book is a special disappointment. Part of the fault lies in its basic conception. Its title conceals the fact that in French usage *technique* is a term of such wide connotation as to be virtually useless for analytical purposes, as Jacques Ellul's *The Technological Society* exemplified some years ago. For the French generally, all expertise is "technological" and, following this logic, Meynaud is as much if not more concerned with the role of military and financial experts as he is with scientists in the American sense. He therefore has been forced to tackle a subject so vast as to be almost unmanageable. Focusing on a small part of it, he concentrates on the political role of the technically trained bureaucrats—typically the products of the *Grandes Ecoles*. As a result, his book will be of interest primarily to the student of comparative bureaucracy rather than to one concerned with the larger interrelationships of science, technology and politics. *Technocracy* is also (and here the author is perhaps reflecting a general weakness of French political science) an extremely parochial book and assumes much detailed background in French government and administration, including minor ideological and political conflicts. Reference to British and American experience is marginal, confusing and occasionally fantastic. For example, re the American presidency, Meynaud comments: "We need simply to notice that over the last few decades (especially after the reforms of 1939, following from the report of a three-man commission, which specially recommended the piecemeal development of a 'fourth branch' with no direct responsibility to anyone) the President's immediate staff has continually increased." (P. 277) This is unfortunately only an extreme example of a confused text rendered doubly unfathomable by inadequate documentation.

Though Meynaud has many ideas and insights to contribute to the general discussion of bureaucracy, they are obscured by generally bad writing made more impenetrable by a bad translation. His style is extremely discursive, though rarely graceful, and it is often difficult to tell whether he is expressing his own ideas or reporting those of others; thus his position remains obscure. In addition, *technocracy* is dated. The original French edition was copyrighted in 1964, though apparently some footnotes were hastily added to the British edition of 1965 which is what the Free Press is reprinting here. Nor are the added footnotes of much use; they are frequently incomplete and in some instances completely incorrect; e.g., p. 102 where a textual reference to a book by Fred J. Cook is footnoted by the incomplete citation of a work by

(Maxwell) Taylor.

Mores the pity. For Professor Meynaud is an eminently humane and sane observer of the phenomena he discusses. He recognizes that the role of the expert cannot be treated in abstraction from general political and economic systems and that at present in France—and elsewhere one might add—bowing to the expert means not only or even perhaps primarily yielding to informed reason but also means the enhancement of the power of the existing capitalist elite, pace James Burnham and his followers, whom Meynaud refutes at length. He also realizes that science is not a menace as such and that, although technology opens up new possibilities of the diminution of human freedom, they will only become actualized if the electorate and political leadership of democracies permit them to be. Science presents potentialities, but politics is paramount in determining the future. Deeply concerned that men learn to master the new technical elite which threatens to make formal democracy meaningless, he attempts briefly to prescribe how this might be done. But his suggested methods of strengthening control by the people—"Redistribution of authority within the Executive"; "Reevaluation of parliamentary influence"; and "Modernization of political forces"—manifest the same weaknesses as the book as a whole in being simultaneously too general, too specific, and too narrowly French in context.

Thus Meynaud's *Technocracy* is a more sound but less interesting book than his countryman Elul's influential polemic. But it is simply not in the same class with the work of Robert Gilpin on France or with that of men such as Don Price and Donald S. Greenberg on the general problems of the relationship of science and politics. A revised and tightened edition of *Technocracy* might have been of some use to American social scientists, but the present publication is a disservice to the reputation of the author and the publisher alike.—VICTOR C. FERKISS, *Georgetown University*.

The Soviet Police System. EDITED BY ROBERT CONQUEST. (New York: Frederick A. Praeger, 1968. Pp. 103. \$5.00.)

Justice and the Legal System in the USSR. EDITED BY ROBERT CONQUEST. (New York: Frederick A. Praeger, 1968. Pp. 152. \$5.00.)

The two studies appear without assigning their preparation to any specific person or persons. In the preface credit is given by the editor to Messrs. Murray, Friedman and A. Alekseyenko for collaboration in preparing the volume on police, and to Messrs. Alekseyenko and Murray for cooperation in the study on *Justice and the Legal System in the USSR*.

These two slim volumes are useful as systematic

organizations of material and information on the role of police and of the law and courts in Soviet society. They cover the life of law and of the police from the beginning of the Soviet regime in Russia including the latest phase following the post-Stalin reforms. Indeed these reforms provide a focus for the inquiry which the editor and his collaborators have outlined: What is the meaning of the reform which followed the demise of Stalin? What is the practical significance of the rejection of Stalinism, and of the quest for the socialist legality?

The result of the review of the history and of the present condition of the Soviet polity together with its legal and political institutions, leads the editor to conclude that in its fundamentals the regime changed but little. The Soviet state was still a Stalinist state, and whenever it felt that the interests of its policy required it, had not respected its own laws. And "... so long as the Soviet state maintains its rights to override not merely in extreme emergencies, but in all cases where its interests are involved, the letter and spirit of its own laws, advances towards general legality, have no guarantee of permanence."

The same applies to the workings of the police apparatus, which still continues to operate in a basically Stalinist manner:

"For there has been no abandonment of the police machine's role as an institution for controlling population in the interest of leadership ... regardless of law and public opinion."

The editor and his collaborators have relied primarily on the original material and Soviet writings, and have disregarded—with few exceptions—Western literature on the subject. While this is a practice followed much too frequently by other scholars in the field of legal studies, in the case of the two studies edited by Mr. Conquest, this practice is grievously wrong, and detracts seriously from the value of the two books. The impression these two volumes will create is that they are the first efforts in the field, which is quite untrue. Those who would start the study of Soviet institutions by using the studies under review were given no guidelines where to seek additional information, in the works of authors who have been working with significant results in the field.

Not only are individual authors active in the study of Soviet law and institutions not mentioned, but there is no information regarding the periodical literature, translations of laws of the books and Soviet studies into the Western European languages published in this country, Germany, Holland, France, England, Austria and Belgium.

The omission is even more serious, owing to the slimness of the volumes under review and the span of time of the development of Soviet legal

institutions involved. Frequently coverage of key issues is quite inadequate, and some of the institutions are altogether omitted. It is not suggested that the format of the books as such rules out their usefulness for the study of Soviet legal

institutions, but that absence of reference to additional literature available in English and other Western European languages has highly limited their usefulness.—KAZIMIERZ GRZBOWSKI, *Duke University*.

INTERNATIONAL POLITICS, LAW, AND ORGANIZATION

The Politics of Peace-Keeping. BY ALAN JAMES. (New York: Frederick A. Praeger for the Institute of Strategic Studies, 1969. Pp. 452 \$11.00.)

For very nearly a quarter of a century, the United Nations has expended words—by the billions—and deeds—far more than memory easily retains—to maintain both local and general peace. Merely to outline the ceaseless activity of the world organization represents a huge effort of bringing together the records of meetings and field expeditions and the more fugitive evidence of negotiations, deals and pressures. To produce from this vast mass of material a comprehensive account in a well-organized framework is a real accomplishment. Alan James, Senior Lecturer at the London School of Economics and sometime Rockefeller Research Fellow in International Organization at Columbia University, has done precisely this in *The Politics of Peace-Keeping*.

This tightly-written volume includes every effort under United Nations auspices to deal with active conflicts that get attention at the international level, except for those involving collective security in a closely-defined sense. James concerns himself with the goals of individual states as they interact and with their maneuvers to protect or advance their interests as they define them. From these maneuvers emerge the conflicts that come into the purview of the United Nations. The organization produces influences of its own, which are directed towards, and sometimes achieve, changes in state behavior. James does not seek and expose the causes of state behavior within the domestic polity. Nor does he project state behavior on the broad background of a theoretical system. His explanations and rhetoric hew closely to those of the diplomatic historian, although his analytical framework does not tie his study to a time scheme. His explorations of diplomatic alternatives available to governments involved in conflicts, either directly or through the United Nations, are sensitive and ingenious.

James employs a wide definition of peace-keeping, so broad as to revise drastically the conventional conception of this form of United Nations work. It encompasses all of the usual modes of peaceful settlement of disputes, such as negotiation, mediation, enquiry, etc., as well as the more recent organizational innovations in the form of non-violent employment of military forces which

have been dubbed "peace-keeping" since Dag Hammarskjöld and his associates discovered Chapter Six-and-one-half of the United Nations Charter. Any national effort to which the United Nations responds as a proximate or distant threat to the peace falls within the definition. Aggression and response to it by enforcement action involving Security Council decisions of binding legal effect and invoking the combined might of the great powers if excluded. Not much in what the United Nations calls the political field, as well as in the treatment of colonial problems, falls outside of this definition. James concentrates on overt, perceived disputes and conflicts; this excludes by implication those methods of promoting peace by such means as general arms control systems or raising the level of general welfare which, some assume, reduce international conflict.

In order to deal with incidents that range in size and notoriety from the Buraimi Oasis dispute to the Congo, James devises an intelligent and reasonably precise set of three main categories and 10 sub-categories. He assigns incidents to the categories on the basis of goals expressed in United Nations resolutions, modulated by the contents of debates and governmental statements and his own estimates of intentions. Inevitably an affair as complicated as, for example, the long-enduring Palestine case changes in the course of treatment by the United Nations and must therefore be split among the sections of the book. Useful cross-references restore some unity to the resulting fragments.

In James' scheme, the first category, "Patching Up," includes efforts in the United Nations to bring about the settlement of disputes or at least reduction of conflict to a tolerable level. Cases are analyzed within four sub-categories of activity—impartial investigation; mediation; supervision, which covers United Nations assistance in carrying out an agreement between disputants; and administration, which includes short-term or longer international rule.

The second and third categories, "Prophylaxis" and "Proselytism," are more novel in conception and content than the first. The sub-categories of prophylaxis, intended to keep a dispute from getting any worse without settling it include accusation, or the use of reporting to discourage objectionable behavior; sedation, or calming efforts

among which are negotiations and "cooling activity at the military level," (p. 260) as in the Palestine Truce Supervision Organization; obstruction, or the placing of a force, such as the United Nations Emergency Force, between the contenders; and refrigeration, or the exercise by the United Nations of governmental functions in a contentious zone without agreement on the eventual outcome, as was proposed for the former Italian colonies.

"Proselytism" encompasses efforts to "... upset certain aspects of the established order. . . ." (p. 9) by means of invalidation, or the use of reporting and investigation to show "that a regime has lost all moral right to continue its rule," (p. 372), a procedure employed continuously by the Committee of 24 on colonialism. Proselytism also includes coercion (but not of the collective security type) as used in Rhodesia and in the Congolese province of Katanga.

On the basis of this subtle differentiation of various forms of peace-keeping, James attaches to the consideration of each a cautious estimate of the likelihood of its future use, always calling attention to the national policies and power alignments required as preconditions. "Certainly," he generalizes, "UN peacekeeping seems to be firmly established as one of the processes to which states can resort for the furthering of their international purposes." (p. 439) Again and again, he emphasizes his belief that the use and success of peace-keeping efforts depends ultimately on the attitudes of the governments concerned and, for the naive, remarks that United Nations peace-keeping neither ends politics nor raises its moral tone. Rather it offers a means for obtaining stability, a goal which he asserts underlies the bulk of peace-keeping.

It is a source of cohesiveness and consistency in this study that its author clings so tenaciously to his vantage point at the level of state policy. Yet this prevents him from commenting on the development and future of the United Nations as an international institution that is something more than its individual members and something less than a government. Implicitly his work recognizes the United Nations as an apparatus of this character, as he writes, for instance, about attempts by the organization to send a group of observers, or as having a defined point of view, but he nowhere makes explicit his estimate of the influence the institution has on international politics generally.

In as meticulous a book as this one, it is regrettable to find the Dominican Republic always called "Dominica," a minor Caribbean island with a British colonial background. Insertion of a chart of cases, using James' analytical scheme, would have improved this already very useful study.—LEON GORDENKER, *Princeton University*.

Neutralization and World Politics. By CYRIL E. BLACK, RICHARD A. FALK, KLAUS KNORR AND ORAN R. YOUNG. (Princeton: Princeton University Press, 1968. Pp. 165. \$7.50.)

In the spring of 1966, four members of the Center of International Studies at Princeton University undertook, at the invitation of the Senate Foreign Relations Committee, a study of the applicability of neutralization to the problems of conflict in Southeast Asia, especially Vietnam. Out of this experience grew the present, more general, study. Meant as a contribution to contemporary International Relations literature, it is a clear, well-organized though preliminary exploration of the principal issues involved in the concept of neutralization, its risks and its advantages. The authors have produced a coherent argument and a craftsmanlike review of historical precedents and practical problems. Individual contributions are not identified and have been well integrated. But this unity of result has also been achieved at the price of a certain blandness and lack of individuality reminiscent of committee-negotiated government documents.

In the tradition of international law, the writers see neutralization as "a formal status of permanent neutrality" suitable or potentially attractive "only for relatively minor states." They define it more technically as "a special international status designed to restrict the intrusion of specified state actions in a specified area" and distinguish it from demilitarization and neutralism. The state actions referred to are mostly the activities of Great Powers: non-interference in domestic affairs and various types of military activity with respect to a particular territory. They see the establishment of a neutralized status to rest upon prior conditions of balance, both of power and of the objectives of the major states involved: a military stalemate and an equilibrium of resolve. A negotiated neutralization agreement translates the condition of military stalemate into that of political stalemate.

While the initial agreement to neutralize thus rests upon a stalemate between the Great Powers, the viability and the maintenance of neutralization is posited upon the strength of national institutions in the particular area. Local stability also removes from the neutralized state the odium of inferior or protected status. The vitality of Swiss neutrality rests upon indigenous resources of organizational capacity; but these have been lacking in Laos and have jeopardized the settlement negotiated there in 1962, and they are those found most wanting in Southeast Asia in general. Yet, as the authors recall, neutralization need not necessarily offer solutions for eternity. If it is a formula that succeeds in organizing and maintaining the settlement of a conflict for a period of

twenty to fifty years, it may be said to have achieved its purpose.

With regard to Vietnam, the book presents some caveats and few solutions; "there is, of course, no point in drawing an overly optimistic picture of the prospects of achieving a neutralization agreement for South Vietnam." The principal consequence of such an agreement would be to provide a "framework within which a process of political shakedown" including "violence of substantial proportions" "could take place without endangering international peace and security." "The outcome would constitute the closest approximation to self-determination that South Vietnam is likely to achieve in the near future." While the Paris talks, begun since the completion of this volume, crucially revolve around the question of troop withdrawals, the concept of neutralization as such does not appear to have become a negotiating objective of either side.

The dominant note of this study is caution, even modesty, in advancing the merits of neutralization. "Neutralization is a concept of limited applicability" reads the opening page of the preface and the feeling prevails that the authors are conscious of addressing a sceptical, if not critical, audience; they seem to be trying hard to be reasonable, pragmatic and sensitive to the 'realities of world politics.' This is particularly apparent in their discussion of the applicability of neutralization to larger states or to more important areas such as Europe. With all this caution they may have taken the attractiveness out of a promising idea which should be of theoretical interest to all students of International Relations. For if neutralization is indeed a method for resolving conflict between the Great Powers, arrived at by way of stalemate, it could have wider applicability: potentially, to all areas of the global system.

The 'world politics' which the authors accept as the unquestioned framework of their analysis is only one particular type among possible world orders. It is a type of world politics characterized by a high incidence of major wars, and the preeminence of Great Powers deriving from their role in wars and their settlement. True neutralization is incompatible with this system because the conditions of war and Great Power control undermine the viability and diversity of domestic institutions in the lesser states, on which lasting neutralization must rest. Conversely, a situation of global stalemate of power and resolve might conceivably create conditions in which the neutralization of large areas based upon the absence of war and upon indigenous strength would prove a plausible alternative to the contemporary system of Great Power politics.—GEORGE MODELSKI, *University of Washington*.

Supranationalism and International Adjudication.

By FOREST L. GRIEVES. (Urbana: University of Illinois Press, 1969. Pp. 266. \$10.00.)

Those interested in evolving international institutions and in burgeoning "world law" will find in Forest Grievess' comparisons of five international courts (the Central American Court of Justice, the Permanent Court of International Justice, the International Court of Justice [ICJ], the Court of the European Communities [CEC], and the European Court of Human Rights) a useful handbook and a compact analysis. The author devotes one chapter to each court, introduces them all with a chapter on "Sovereignty and Supranationalism," and follows them with his "Summary and Conclusions," eight appendices (57 pages of selected articles from the constituent instruments and a table of CEC cases), and sixteen pages of bibliography.

Grievess' introduction points out that *supranationalism* is a new political term, having been used privately only as far back as the 1940's and in international public law for the first time as recently as 1951 in the treaty establishing the European Coal and Steel Community. By reminding us of these facts, Grievess demonstrates both how contemporary and how important his subject is. After discussing the ambiguity that inevitably surrounds so new a word, he joins Werner Feld in defining the term to mean "that signatory states have transferred to an international institution certain limited decisionmaking powers normally exercised only by the governmental organs of a sovereign state, powers which include the capability of issuing, under certain specified conditions, binding norms to the states or to their inhabitants" (p. 14). By this criterion, only the CEC qualifies as supranational, and Grievess makes his point sharply by singling out the case of *M. Flaminio Costa v. E.N.E.L.* (1964), where the CEC successfully upheld a Community norm in the face of a decision by the Italian Constitutional Court that ignored the Treaty of Rome. Grievess discusses individual cases only when they bear directly on supranationalism, but his lists and tabulations of contentious cases that have come before each of the courts makes his book a helpful compendium of the courts' jurisprudence.

Grievess measures the courts' supranationalism by examining their constitutional bases and their practice, which seems reasonable enough. But he also looks at the courts in terms of the expectations of statesmen instrumental in bringing them into being, hoping (p. 16) that the "supranational views of leading statesmen during the *travaux préparatoires* . . . are relatively indicative of the milieu within which an international tribunal was founded." In this view, he cannot be challenged,

but it is puzzling that, while admitting that expectations are "not always a particularly reliable indicator of a court's power," he persists in classifying expectations as a measure of power. Because state-men's hopes are interesting and important, they could certainly stand on their own as a contrast to later realities. Treating them just as background material would have been far more legitimate and would, moreover, have made Grieves' presentations less mechanical than they now seem. The rigid parallelism of his five central chapters facilitates comparisons, no doubt, but it is a rather primitive mold into which to press his study. A profusion of subheads and numbered or lettered sections heighten one's feeling that one is reading an outline rather than a completed work. The pedestrian handling of the much-vexed problem of sovereignty with which the book opens is no adornment either and emphasizes the book's more routine aspects. One is also put off by Grieves' leaning somewhat heavily on John Herz's "Rise and Demise of the Territorial State" without taking account of his later "The Territorial State Revisited."

If, however, Grieves starts out by over-stressing the state's decline, his strict focus on supranationalism and adjudication keeps him in one instance from doing full justice to the courts' impact on the nation-state system. He fails to point out, in discussing access to the ICJ (pp. 91-92), that UN organs and specialized agencies authorized by the General Assembly may request advisory opinions of the ICJ. This omission is all the more unfortunate because he has earlier (p. 9) referred to the Advisory Opinion on Reparations for Injuries Suffered in the Service of the United Nations to show that "international organizations . . . have assumed a juridical personality." Later (p. 137), too, he gives full marks to the CEC for permitting entities other than states to appear before it and cites its capacity to "render advisory opinions in connection with the treaties" defining the European Community. Advisory Opinions are not, of course, *adjudication*, and *adjudication* is this book's subject. Technically speaking, therefore, Dr. Grieves cannot be faulted. But there is an inconsistency here, and access to the ICJ for advisory opinions does cast light on supranationalism.

Grieves has worked with original materials and, where necessary, translated them, though not always felicitously. At times his attention to our linguistic needs seems a bit fussy, too, as when he writes (p. 14) of the constituents of Pierre Pescatore's definition of *supranationality*: "common interests (*intérêts communs*) . . . real powers (*pouvoirs réels*) . . . and autonomy of this power (*autonomie de ce pouvoir*)." He is also carried away one page earlier, where he burdens us with

"Fig. 1 Spectrum of Interstate Bonds (*Staatenverbindungen*)," as if the German word added anything.

Despite these gratuitous displays of erudition, Professor Grieves does us a service by emphasizing the need for political and social consensus if international adjudication is to succeed and in demonstrating by an extreme negative example (the Central American Court) and an extreme positive example (CEC) how important spirit and practice are in contrast to expectations and constitutional documents. His comments on judicial impartiality and on our inability to measure it adequately are provocative, and his endorsements of the CEC practice in not using *ad hoc* judges and in keeping its votes secret are both modest and apposite. He would like to see the ICJ adopt the same procedures, but he realizes full well the difficulties standing in the way of such changes.

Grieves quotes (p. 174), endorses, and confirms Hersch Lauterpacht's view that "there are few rules of modern international law . . . more widely acknowledged than the rule that the jurisdiction of international tribunals is derived from the will of the parties," and he shows us again that, by and large, states are still unwilling to preside over their own demise.—RICHARD N. SWIFT, *New York University*.

Conflict and Consensus in Labour's Foreign Policy 1914-1965. BY MICHAEL R. GORDON. (Stanford: Stanford University Press, 1969. Pp. 333. \$8.95.)

Political scientists from a number of specializations will find Gordon's book rewarding. It will be welcomed by those who are concerned with the discovery of identifiable constants of political behavior over a long period of time; it will provide a useful case study for those who seek evidence of the relationship between ideology and attitudes on foreign policy; scholars specializing in political parties will find a gold mine of evidence concerning factional strife as a component of the democratically-structured party; those oriented toward the study of political leadership will be interested by the author's clear description of the interaction between the Labour Party elite and its challengers within the Party. All will admire, I think, Gordon's capacity for reducing a substantial body of intractable material to a systematic formulation of principles and problems.

On this latter point Gordon is quite clear. He is concerned with accounting for the nature of the conflicts that have divided the Labour Party in the area of foreign policy and with identifying the causes of their persistence. He stays always within the strict limits that he has set for himself, using the history of the Party's foreign affairs controversies since 1914 primarily for analytical purposes.

The first problem approached is the analysis of socialist foreign policy as perceived by Labour partisans. Relying on a four-fold classification derived from Richard Rose, the author proceeds to dissect Labour's loyalty to the principles of internationalism, international working-class solidarity, anti-capitalism, and anti-militarism (conceived as antipathy to power politics and accompanied by varying degrees of pacifism). The description of these four tenets of socialist foreign policy could hardly be improved upon for accuracy or comprehensiveness. This exposition is important because it reveals unequivocally the distance separating the ideological slogans themselves from the content which the slogans have concealed. Indeed, it has been one of the most disconcerting characteristics of the Labour Party that it can claim, after the event, to have formulated a clear-cut policy when an investigation of its actual position at the time will often reveal a good deal of ambiguity. The Party's real talent in the area of foreign affairs often lies in its ability to manipulate principles that have clearly perceived symbolic appeal.

The book is divided into two parts, the years between the two world wars and the post-World War II period, with a brief connecting chapter on "Socialist Foreign Policy and World War II." The section dealing with the years 1920-1939 brings out clearly the Party's difficulties over a League of Nations-oriented policy of collective security. These years were crucial, as the author points out, for they provided the laboratory in which Labour could have tested its fundamental assumptions about the nature of interstate relations and might have adjusted in a responsible way to the world of reality. Eventually adjustments were made, but only at the approach of World War II and with the agonizing and protesting Party being dragged along by the inexorable march of events. Collective security meant, until two years before the war, disarmament, arbitration, and the mobilization of an anti-war public opinion. Indeed, Labour's attachment to Socialist principles leads Gordon to conclude that "to most Labour partisans disarmament and collective security were at bottom one and the same thing." Even after Ernest Bevin forced the Party to revise its stand on armaments, there was still the puzzling opposition to the introduction of conscription in the spring of 1939. Even though war did come, there was no serious attempt in the Party to re-evaluate socialist principles in the light of the international event of the interwar years. "Right up to the end of hostilities," writes Gordon, "the thrust of party utterances fostered the widely diffused belief that socialist foreign policy was as intellectually sound and morally compelling as ever. . . ."

After 1945, however, a startling change occurred. When the Soviet Union unleashed her cold war pol-

icy against Great Britain, the Party leadership responded in kind. With Bevin at the Foreign Office, the Labour leadership maneuvered the application of a traditional foreign policy based on the availability of armed forces as a deterrent, the need for alliances, and the admission that the most far-reaching national rivalries did in fact exist. Attempts were sometimes made by the leadership to identify the newly-accepted realism with the long-standing socialist principles, but the depth of the change was nonetheless unmistakable. The sniping of the socialist purists (or "fundamentalists") gradually subsided and by 1950 a near-consensus had been maneuvered by a Party leadership skilled in the techniques of educating the rank and file in the principles of realism.

The Korean War, however, shattered, irretrievably as it turned out, the process of adaptation. The re-emergence of a strong current of socialist orthodoxy, eventually marshaled by Aneurin Bevan against the Party leaders, was the signal for the eruption of anti-Americanism, neutralist currents, renewed pacifism—in short, the re-appearance of bitter doctrinal disputes which still plague the Party. One of Gordon's more startling findings is that for the past several years the two forces, orthodox and revisionist, have been almost evenly balanced. That, in itself, would account for the policy of drift of the Wilson Government. In spite of the well-known powers of the British Cabinet, it is difficult to apply any consistent foreign policy when the party in power is so divided by principles that neither faction can impose its will on the other.

Still, there remains the marked disparity in treatment given to the periods before and after 1945. More than half a century is the time span indicated by the title, and yet nearly three-fourths of the book is devoted to the last twenty five years of the period covered. That this approach can be justified in terms of relevance to today's international scene is doubtful. For while the years before 1922 are dealt with in the briefest fashion, the post-1951 period is given an almost equally sketchy treatment. In reality, the heart of the work is the admittedly important era of adaptation to power realities, 1945-1951.

In his truncated account of the period 1920-1939, Gordon says little about Labour's hostility toward the peace treaties, particularly to their territorial provisions. In reality, the Party's rejection of any military props to collective security in Europe was not due solely to its socialist ideology; it was indissolubly linked to the fear that arms might be used to reinforce territorial boundaries that were thought to be intrinsically unjust. Labour propaganda on that score was unmistakably similar to the claims of German nationalists and militarists and yet neither MacDon-

ald nor Henderson, aware as they were of the real situation inside Germany, made any meaningful effort to reorient the Party away from its pro-German bias. Nor does the author take into account the persistently anti-French posture of Labour. The ultimate importance of this attitude can be debated, and yet neither the impact of Anglo-French differences on the crumbling of the post-war order nor the Labour Party's contribution to the debacle can be ignored.

The author's omissions or near-omissions along these lines probably stem from his arbitrary division between the "progress" years of the 1920's and the "crisis" years of the 1930's. Gordon believes that Labour's "socialist policy fared well enough in the earlier but not in the later decade." But did it fare well in the earlier decade? To say that the crisis of the thirties was due to "circumstances" or to "a fateful turn" of events is to deny the essential unity of German nationalist goals during both decades. Gordon attributes too much perhaps to the influence of socialist ideology and too little to specific aspects of Labour attitudes that were sometimes more "liberal" than socialist.

In spite of these reservations, we can be grateful for a work that applies admirable scholarship to the exploration of an intriguing subject.—WILLIAM R. TUCKER, *Lamar State College of Technology*.

The UN and the Middle East Crisis, 1967. By ARTHUR LALL. (New York: Columbia University Press, 1968. Pp. 322. \$10.00.)

This work is essentially an account of negotiations within the United Nations and a catalog of UN actions relevant to the Arab-Israeli conflict during a six-month period in 1967. The author prepared his study while serving as Adjunct Professor of International Affairs at Columbia University. His sources are official UN records and information supplied by the principal actors at UN headquarters. His access to the latter was facilitated by personal contacts dating from the time when he was Indian Ambassador to the UN. Although his work abounds with citations from official documents (its *Appendix* alone contains the text of twenty-five resolutions that were proposed during 1967, ten of which were adopted by the Security Council or the General Assembly), there are virtually no footnotes indicating sources for information gleaned from his extensive interviews and conferences.

The author explores no hypotheses, and he advances no general theories. Nevertheless, it is clear that he regards peace in the Middle East, together with safeguarding the territorial integrity of all states in the region, as desirable goals for the international community. Equally clear is his conviction that the United Nations and particularly the security Council, which he deems much bet-

ter suited for such purposes than the General Assembly, should be effective instruments for achieving such goals.

In providing the reader with a detailed and impartial account of proceedings before the UN, Ambassador Lall displays admirable objectivity. His impartiality is particularly noteworthy because the kind of experience that he has had in Middle East affairs often produces an anti-Israeli bias. For more than two years he served as India's representative on the General Assembly's Advisory Committee which was charged with assisting the Secretary-General in directing the work of the United Nations Emergency Force. Israel's refusal to permit such forces on her territory (in contrast to Egypt's affirmative response over a period of ten years) is duly noted, but the author's ascription of even larger obligations on Egypt's part offers no support for simplistic defenses of the latter's decision to order the withdrawal of UNEF in May, 1967.

This study would be of greater value to the average reader if it contained even a brief account of the roots of the conflict, and it would be much enriched by the inclusion of analyses of the interests and goals that lay behind the positions taken by the parties to the dispute and by the other principal actors at the UN. Equally regrettable is the absence of any attempt to evaluate the disputants' charges and countercharges concerning breaches of the peace and acts of aggression. However, those interested in bargaining or in the utility of international organization will be grateful for Ambassador Lall's identification of lost opportunities for peaceful settlement and his catalog of institutional failures, such as the Advisory Committee's failure to call the General Assembly into special session when Egypt ordered the withdrawal of UNEF prior to the "six-day war." Moreover, his legal-political analysis of the status and the withdrawal of UNEF (Chapter II) is one of the most valuable parts of the book.

Ambassador Lall's study provides many other insights into the essentially legal aspects of UN procedure. Some examples are noteworthy: (1) the continuing and, to Lall, untenable claims of "belligerent rights" by all parties to the conflict *vs.* obligations under the Charter to refrain from the threat or use of force; (2) the alleged legal incapacity of the UN to "condemn" states as aggressors, a limitation vigorously defended by the author in his critique of certain clauses of anti-Israeli resolutions proposed by the Soviet Union and other "pro-Arab" states; and (3) the ease with which the organization sometimes functions without regard to legal technicalities. In regard to the latter point, it appears that the special session of the General Assembly was called by the Secretary-General in June, 1967, without regard to es-

established procedures but simply on request of the Soviet Union. In accordance with Soviet intent, moreover, the Assembly proceeded to consider draft resolutions (two of which were eventually passed) without regard to Article 12 of the Charter, which bars Assembly recommendations concerning disputes that are being considered by the Security Council. As Ambassador Lall observes, there are several precedents for this deviation from the Charter. With regard to Security Council voting procedure, however, the Middle East crisis produced real innovations. During a time of alleged cease-fire violations, and while the Council was deadlocked in debate over draft resolutions concerning the substance of the entire dispute, the President of the Council proclaimed "consensus" in favor of stationing UN Military Observers in the Suez Canal sector. There was no objection, and he declared that the consensus was accepted. Shortly thereafter (again without objection) he referred to this consensus as "the *decision* which we have just adopted." (See p. 202.) More innovation, however, occurred during a similar impasse later in the year when another President of the Council consulted with his colleagues and proclaimed a decision in their name. Ambassador Lall sums up this development as follows:

This was the first time in the Council's history that a substantive decision was taken by a consensus arrived at without a formal meeting being called. By doing without a meeting the Council both avoided contention and saved face for certain of its members. (P. 268.)

This decision authorized the Secretary-General to enlarge the number of observers in the Suez Canal region and to arrange for additional technical material and means of transportation.

During the last six months of 1967, the General Assembly passed two resolutions dealing with rather limited aspects of the Middle East crisis, while the Security Council produced seven resolutions (one of which, on November 22, addressed itself to all the issues in dispute and provided an "authoritative" outline of basic principles for a general settlement). These actions were in addition to its two other "decisions" arrived at by "consensus." Two years later, however, the substantive terms of all these recommendations and directives remain unimplemented, in spite of the passage of many subsequent resolutions reaffirming the UN's previous actions. In defiance of the UN, Jerusalem has been incorporated into the Republic of Israel, no captured territory has been evacuated, ceasefire violations occur daily and *de facto* warfare is recurrent, there is no settlement of the refugee problem, freedom of navigation on international waterways remains to be established, and both sides in the conflict claim the rights of belligerents. The gap between success in negotiating the passage of resolutions and securing

their implementation continues to widen, and the attempts at quiet mediation by the UN's skilled Special Representative to the Middle East have been unavailing.

In this reviewer's opinion, the fundamental conflict between Arab nationalism and Israel's assessment of her own basic security requirements makes clear that the only peace that is possible would be one enforced by a Soviet-American consensus, whether imposed under UN auspices or otherwise. Since both states lack the will to impose a settlement—even when agreeing on one, as they did in 1967 (see pp. 211, 263, 309)—the Middle East will continue indefinitely to be an arena of armed conflict in which minor powers have the means to involve the great powers in a "war by proxy" or in direct conflict. Even an imposed settlement, however, might entail prohibitive risks and costs. This gloomy forecast, it should be noted, is in sharp contrast with the position taken by Ambassador Lall following passage of the Security Council's comprehensive resolution of November 22, 1967. In his view,

Never was the prospect of peace in the Middle East brighter than at the beginning of 1968. The chances of moving forward from the armistice regime instituted nineteen years previously were good and solid. Only grave errors on the part of the international community could fail to convert this opportunity into a reality. (P. 279.)

Such conclusions seemed unwarranted even in their original context, since Ambassador Lall accurately underscored the resolution's ambiguities and also reported that none of the parties to the conflict committed itself to carry out the resolutions provisions. In the case of Israel, for example, Foreign Minister Eban declared: "My Government will determine its attitude to the Security Council's resolution in the light of its own policy . . ." (Quoted, p. 264.)—H. PAUL CASTLEBERRY, *Washington State University*.

German Foreign Policy in Transition: Bonn Between East and West. BY KARL KAISER. (New York: Oxford University Press, 1968. Pp. 153. \$1.95.)

The reader may well expect an enriching reading experience when he first takes this slender volume in hand. The author, a German political scientist who has taught at Harvard, the Johns Hopkins Center at Bologna and the University of Bonn, is a widely published and deservedly respected student of European and German politics. The publisher is a university press of the first rank, and the book was issued under the joint auspices of several prestigious scholarly institutions. However, while the essay contains some useful descriptions of and insights into the roots and implications of recent shifts in Bonn's *Deutschlandpolitik*, such virtues are regrettably buried

beneath the verbiage of what is a very poorly written book. Indeed, after three close readings, I am not certain that the values of those scattered paragraphs are commensurate with the chore of wading through such an inconsistently edited, logically flawed and generally disappointing volume.

While the title indicates a rather broad scope, the author demurs: "This study is not a history of German foreign policy of the post-war period, but only an essay. It deliberately focuses on certain themes and does not discuss in detail a number of dimensions . . ." (p. 4). The themes Kaiser has selected are restricted almost entirely to the Federal Republic's policies regarding the division of Germany and to the interplay between those policies and their domestic and systemic environments. He attributes the growth of Bonn's attachment to the West in the years after the war, the development of the Hallstein Doctrine (intended to impose a diplomatic quarantine on the East German regime) and the assumption of the "policy of strength" to a convergence of Western (one could generally read "American") strategic ends and the efforts of West German politicians to cope with their endemic problems of insecurity.

This post-war posture did not manifest potential for bringing reunification closer. The mutually reinforcing (or exacerbating) relationship between the division of Germany on the one hand and the division of Europe and the Cold War confrontation on the other led to an impasse familiar to all observers of the world scene: a *détente* between the blocs was viewed to be a prerequisite for the resolution of the "German problem," and German reunification appeared impossible without a prior relaxation of Cold War tensions. Bonn's stance remained essentially unchanged until its western allies signalled a shift toward *détente*, though many West Germans had recognized that progress toward reunification could not be made through such policies.

Movement away from the rigid post-war posture was slow and difficult, especially until the advent of the Great Coalition, in 1966, because *Ostpolitik* in general and *Deutschlandpolitik* in particular had become highly politicized in the Federal Republic. Further, as Kaiser points out, the unresolved German question translates many German phenomena into significant inputs into the European and global systems. It also magnifies the impact of many external developments on politics inside the Federal Republic.

Since Kaiser is generally thorough in his treatment of environmental factors, his one omission stands out: he fails to take adequate note of the import of the primacy of concern that has come to characterize America's extra-European involvement during the very years that Bonn's reorientation has taken place. While it was the Kennedy

administration's move toward the policy of *détente* that gave initial impetus to Bonn's shift, it was America's deepening involvement in Vietnam in 1965 and 1966 that provided the enhanced freedom of action for the Federal Republic that made the policy changes possible. The opening to the East clearly bears a German imprint—and it was contrary to the American style of "alliance leadership" prior to the escalation of the war in Asia to yield that much initiative to its partners.

Kaiser refrains from attempting to resolve the dilemmas borne by Germany's division and unique world position. He does conclude on a reasonably positive note, however:

West Germany's adaptation to the division and her attempt to enter into a peaceful working relationship with East Germany, though not a solution to the German problem, may still be a net gain. There are no *feasible* alternatives (p. 139).

While in his descriptions of the evolution of Bonn's policies the author has made a valuable contribution to the body of "current historical" knowledge, his analysis in general is marred by logical lapses, extremely distracting language and occasional manifestations of conceptual indifference. Two or three illustrations of each of these problems should suffice here.

On page 54 Professor Kaiser presents four tables, in order to demonstrate that

a reunified Germany would not . . . simply be the sum of two existing states. She would occupy an entirely new category—that of a nation whose power fell short of the two super-powers but considerably ahead (except for the possession of nuclear weapons) of Europe's traditional great powers like Britain and France (p. 55).

Yet, the elaborate tables demonstrate no such thing! In each the Federal Republic's rank is the same as the rank that a reunited Germany would occupy—and in each the Federal Republic already surpasses the standing of all European powers! On page 48 Kaiser writes that,

as German critics of past Bonn policies have often pointed out, governments are not pawns in the hands of their public but can influence public opinion through courageous and convincing leadership. *To do so requires, however, that a majority of those are convinced of the wisdom of the move [italics added].*

To move public opinion in the direction of supporting governmental policy does not, of course, require the conviction of 51% of "those in key positions"—or, for that matter, of any specific number or proportion. That task can be achieved by one individual in some circumstances—or the whole leadership can fail in attempting it.

Throughout the text such terms as *nation* and *interaction* are used without particular regard for their established conceptual meanings. Such usage could be viewed as simply another manifestation of Kaiser's monumental language problem were it not for his effort to develop what is a provocative

and potentially fascinating analytic line. Kaiser asserts that the two Germanies

are two parts of one nation and, therefore, taken together, from a domestic national context with its own habits of thought and action, quite different from those characteristic of relations between other nations in opposing international systems (p. 28).

In order to use this notion it is imperative to distinguish this view of the domestic context from the more orthodox one—or at least to restrict usage to the former. This is not done; and the term is used in both senses indiscriminately. Second, the concept of nation requires specification if it is to serve purpose to which the author wishes to put it. In spite of the recurring bald assertion that "Germany is still one nation" (at pp. 21, 28f., chap. 8 and elsewhere), the determinants and boundaries of the concept are never made clear.

The most distressing aspect of this book is the language. The syntax is a jumbled mixture of English and German. Very few sentences flow smoothly, and graceful construction is not manifested at all. Subordinate clauses frequently dangle in grotesque ways. The vocabulary is extremely narrow, leading to banal formulations of good thoughts and to a general sense of *déjà vu*. It is this last characteristic that makes the book read long. Finally, some uncorrected grammatical errors remain in the text. Perhaps Kaiser should have written in his native language and then had the work translated.—MARTIN O. HEISLER, *University of Maryland*.

Eleven Against War, BY SONDR A. HERMAN.
(Stanford: Hoover Institution Press, 1969. Pp. 264. \$2.95, paper.)

Eleven Against War is an impressive study of the extension of American reform sentiment into the arena of foreign affairs. The author wishes to generate a deeper understanding of the resulting international idealism which, she believes, received too hasty a burial by realistic thinkers (Kennan, Morgenthau, Nieburh) in the Cold War Era. To accomplish her purpose, Herman explores the views of eleven American reformers: Woodrow Wilson, Elihu Root, Nicholas M. Butler, Hamilton Holt, Theodore Marburg, A. Lawrence Lowell, John Bates Clark, Franklin H. Giddings, Josiah Royce, Jane Addams, and Thorstein Veblen. All were dedicated to changing the relationships of nation states with the avowed aim of preventing future wars. The life experiences of the reformers, their basic philosophical assumptions, social and political theories, and international conceptions are lucidly presented and interrelated. Each chapter is rich in information and skillful in synthesis.

The major thesis of the book is that American internationalism in the early twentieth century contained a sharp division between the "men of

the polity" and the "communalists." The former (Wilson, Root, Butler, Holt, Marburg, Lowell, Clark, Giddings) extended their atomistic, competitive view of American society into the international arena. A natural harmony of interests was assumed to exist between the advanced nation states. Free competition among these nations would be beneficent if protected and tamed by the rule of international law. The "men of the polity" tended to be international Spencerians, expecting Anglo-American influence to dominate, not by force, but by the persuasion of a superior economic and legal system. Accordingly, their proposals for international peace stressed legal and judicial mechanisms for maintaining non-violent trade rivalries. Within this consensus, they differed among themselves concerning the nature of sanctions to be applied when a nation refused to respect international procedures.

The "communists" (Royce, Addams, and Veblen) flatly rejected competitive individualism as a sound guide for national or international society. They believed that peace could only be achieved by creating an organic community embracing all the peoples of the world. Their proposals emphasized schemes of economic and social cooperation which they hoped would gradually corrode the very spirit of competitive nationalism. The author is generally convincing in demonstrating the connection between the domestic and international views of the individuals considered. The exception is Hamilton Holt who emerges as a strange hybrid when placed in the author's conceptual framework.

Herman credits the "communalists" with recognizing that no natural harmony of interests existed between the advanced nations, and that the nation state system itself created conditions injurious to harmony. The major shortcoming of these thinkers, she contends, was their remoteness from the large organizations which could influence and execute public policy. Jane Addams, although an able leader of a minority protest movement (The Women's Peace Party), never held a public office higher than garbage inspector for the nineteenth ward of Chicago until late in her career. Herman's treatment of Veblen reinforces his image as a lone wolf howling bitterly and brilliantly at the moon. Royce was also detached from large influential organizations.

Herman concludes that the two branches of international idealism failed to recognize their supplementary character. By arguing in nationalistic terms, "men of the polity" made no attempt to educate the public to the possibility of cooperation within a world community. "Communalists," on the other hand, failed to recognize that new cooperative departures could not be made without the participation of large, influential, and established organizations. The responsibility for the de-

cline of internationalism, therefore, rests fundamentally with the internationalists themselves for "cherishing their differences."

The author's conclusion lacks persuasiveness because it does not come to terms with the vast practical problems which faced both the "men of the polity" and the "communalists" in their search for world peace. She wisely prefaces her book with the remark that it is essentially a study of ideas which touches only briefly on why, in the end, the internationalists failed. Judged in the light of its primary objective, *Eleven Against War* succeeds admirably.—EDWARD N. KEARNY, *Western Kentucky University*.

How Nations Behave. BY LOUIS HENKIN. (published for the Council on Foreign Relations) (New York: Frederick Praeger, 1968. Pp. 324. \$7.50.)

Louis Henkin, a competent and respected international lawyer, seeks to explain the relevance of international law to contemporary world events. To this end, he undertakes to answer the question: "in what ways does international law determine or govern or modify, the policies of governments and how nations behave toward each other." Henkin reserves the right to engage in occasional skirmishes with other international law writers. However, the book is primarily addressed to the general reader who is interested in international relations but who underestimates or is unaware of the influence of international law in international political behavior.

This is a worthwhile enterprise. Unfortunately, the author does not do justice to the subject and the book falls short of its goal. The book fails because the central issue of the influence of international law on "international behavior" is not adequately met. Arguments, extrapolations from other legal systems, and speculation about the content and causes of international behavior are presented in a way that fails, in my view, to support persuasively the contention that "international law does far better than its reputation." This is a pity, since the contention is probably true. Indeed, most of Henkin's contentions are plausible and acceptable to those who are familiar with the subject. But the object of the book is to educate and persuade those who are less familiar with or skeptical of international law. This requires more thorough argumentation and evidence, as well as more penetrating scholarship, than is reflected in *How Nations Behave*.

For example, Henkin states that, "A government contemplating action usually asks what the law has been, independently of what it proposes to do." This is quite possibly true. But little evidence is offered in support of this contention. Moreover, there is no adequate investigation of

the possibility that, even if the contention is valid, its significance is not as favorable to Henkin's defense of international law as he seems to assume. Thus, the search for relevant international law within the policy process may be made primarily in order to anticipate and neutralize legal obstacles. Or the search for law may be a search for legal justifications for doing things that the government intends to do in any event. Percy Corbett pursued these themes in devastating detail in *LAW IN DIPLOMACY* (Princeton University Press, 1959) and Corbett was a friend and practitioner of international law. Surely the uninitiated and the skeptics may be expected to think of them and it may be questioned whether they will be convinced by Henkin's optimistic treatment of the subject.

Henkin attempts to protect himself from the charge of superficiality by stating at the outset that his exploration of the subject "must be *a priori* and speculative, less scientific than impressionistic . . . The examples cited are few, and many of them come from the United States." Fair enough, but even by his own standards it appears that Henkin does not provide convincing evidence to support his position and to win over the readers to whom the book is directed.

Specifically, three attempts to make a case for international law fail for lack of evidence. First, the valid and familiar point is made that much of the influence of international law within governmental processes is unknown and, in many cases, unknowable, to the outside world. Granted the problems of access to evidence of such influence, confidentiality and classification, a scholar of Henkin's stature should be able to provide numerous concrete examples of international law at work. They could be taken from memoirs and biographies of statesmen, diplomatic history, and from the author's personal experience as well as the experiences of professional colleagues. Instead, Henkin gives a few *hypothetical* examples of international law being applied. This is not even an "impressionistic" sampling of behavior. It is no sampling. The reader is apparently expected to take Henkin's word that international law influences decision-making in a way analogous to that described in the hypothetical examples. Henkin may be substantially right but his book is about *how* nations *behave* and this portion of the book is not likely to persuade readers that the author's hypotheses correspond to reality.

Second, Henkin attempts to rebut the claim that adherence to international law is largely limited to occasions when national interests coincide with legal prescription. To accomplish this he takes two very curious examples: loyalty to alliance commitments at the outbreak of World War I and within NATO. In each case Henkin points

out that performance of legal obligations has at times required the doing or contemplation of things that would not appear to be in the national interests of some of the allies. No allusion is made to the political, economic, and military factors—particularly as packaged in long-range contingency plans—which may have been more important by far than legal obligations in determining the behavior of the alliance members. Henkin follows these two examples with a third concerning reaction to Hitler's invasion of Poland. It seems to me that the examples chosen fail sufficiently to meet the challenge taken up, namely of proving that law can prevail over national interests.

Henkin also attempts something that is quite important, namely analysis of "the law's other influences." By this he means the subtle role that

legal concepts may play, along with many others, in decision-making. His example is excellent, the U.S. handling of the Cuban Missile Crisis. But his analysis is disappointing. Thus, in arguing against the possible justification of anticipatory self-defense he supports his negative reaction to this concept with one footnote to an article by Quincy Wright and with a full page quotation of himself, surely a most unusual practice, supplemented by some more footnotes to his own writing. On this highly relevant and controversial subject, in a book designed to impress general readers, such short-cuts detract from the legitimate points made and from the authority of the writer.

In short, the much-needed book which Professor Henkin set out to write is still to be written.—
WILLIAM V. O'BRIEN, *Georgetown University*.

ANNOUNCEMENTS

ADDRESS FOR NEW MANUSCRIPTS AFTER JUNE 1, 1970

Beginning June 1, 1970, the REVIEW's Managing Editor Elect, Professor Nelson W. Polsby, will assume all responsibility for referring and making decisions on all newly submitted manuscripts and for deciding on manuscripts referred but not decided on prior to June 1. Accordingly, after June 1, 1970 all new manuscripts and all correspondence concerning manuscripts not then decided upon should be sent to:

Professor Nelson W. Polsby, Managing Editor Elect
American Political Science Review
Department of Political Science
University of California, Berkeley
Berkeley, California 94720

Each manuscript should be accompanied by an abstract of up to 200 words briefly describing the article's contents. All manuscripts and abstracts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

THE SELECTION OF NELSON W. POLSBY AS THE NEW MANAGING EDITOR

On November 14, 1969, the present Managing Editor submitted his resignation to President Karl W. Deutsch. The letter said, in part, "A word seems in order about the timing of [the resignation]. In my discussions with then-President David Truman I agreed to undertake the editorship for a period of three to five years. The transition period began in July, 1965, and the first issue published under my direction was that of March, 1966. Accordingly, I am currently in my fifth year of service and feel that I have fulfilled my agreement with Dave. Quite aside from this, however, it has always seemed to me that a fairly frequent rotation of editors is healthy for the journal (and the editors) and that five years is a reasonable maximum tenure."

The Constitution of the Association (Article VI, section 1) provides: "The . . . Managing Editor of *The American Political Science Review* shall be appointed by the Council, after it hears the recommendation of the President. [He] shall have [a term] to be fixed in each case by the Council; and [he] shall be eligible for reappointment."

At its meeting of December 4-5, the Council established a Search and Screening Committee to assist President Deutsch in considering candidates for the new Managing Editor. The Council stipulated that the Committee be composed of the President as Chairman, President Elect, Managing Editor, three members of the Council, and one member of the current Editorial Board. To the four appointive positions President Deutsch named Herbert McClosky, University of California, Berkeley; Joseph L. Noguee, University of Houston; Vernon Van Dyke, University of Iowa; and Robert E. Ward, University of Michigan.

On December 8 the Executive Director sent a letter to all department chairmen advising them of the vacancy and asking for their suggestions and nominations for filling it. A total of twenty-two replies were received in time to be considered by the Committee. The Council directed the President to recommend a person for the editorship at its next meeting.

Six of the seven Committee members met in Cambridge, Mass. on December 23. Professor Ward was unable to attend but communicated

his views to the President in advance of the meeting. At the meeting the Committee reviewed all the persons—some ninety-four names in all—who had been suggested to them. Several names were eliminated from further consideration because of information, gained from informal soundings, of their wishes not to be considered.

For evaluating those remaining, the Committee agreed upon the following main criteria. First and foremost, the new Managing Editor should be committed to encouraging the best work done by all of the different approaches to political analysis now used or emerging in the discipline; he or she should not be dedicated in any way to promoting any particular approach over the others. The new editor should be a scholar of established reputation. He or she should have editorial talent for evaluating and improving manuscripts as well as administrative talent for managing the journal's office and communications. The editor should already have demonstrated his or her possession of these talents in some way—e.g., by having edited another journal or a volume of essays, or by having acted as editorial advisor for a publisher. The editor should have shown ability both to apply high standards impartially in deciding what to publish and to help authors to present their work in the clearest and most readable form. The editor should be widely familiar with the profession's active scholars, both those older and established and those younger and rising, in all the nation's regions. He or she should be knowledgeable in American Government and Political Theory, since

a majority of the manuscripts submitted are in these fields; but it would be highly desirable for the editor also to have some competence in Comparative Politics and International Politics. And it would also be desirable for the editor to have some competence in related disciplines and some experience in interdisciplinary research and writing.

After agreeing on the foregoing criteria, the Committee proceeded to consider the ninety-odd remaining nominees. After much discussion the number was reduced to a "short list" of six. On a secret ballot each Committee member then ranked the six names in his order of preference. The preferences on the six ballots were combined into a composite ranking, and the Committee agreed that the intervals among the top names were sufficiently large to request the President to present the first name to the Council for its approval.

At the meeting of the Council in Cambridge on January 14 President Deutsch explained the Committee's criteria and procedures and expressed the members' regret that only one of so many excellent nominees could be chosen. He then presented the Committee's first choice: Professor Nelson W. Polsby of the University of California, Berkeley. After some discussion the Council unanimously approved the President's recommendation and Professor Polsby was named the next Managing Editor of the *REVIEW*. He has since accepted the appointment, and will assume its full duties in 1971.

ERRATA

The Officers' Page of the December, 1969 issue incorrectly listed the institutional affiliation of Council Member Allan P. Sindler as the State University of New York, Stony Brook. Professor Sindler's correct affiliation is the University of California, Berkeley.

Also in the December, 1969 issue, the second

sentence of the first paragraph on p. 1216 of Jeff Fishel's article on "Party, Ideology, and the Congressional Challenger" should read: "Of 432 non-incumbents running in that election, 70 percent completed and returned the questionnaire, a response rate sufficiently high to justify the analysis undertaken here."

ANNOUNCEMENT OF NOMINATING COMMITTEE APPOINTMENTS

For Selection of Officers of the American Political Science Association For 1971-72

Officers to be selected: President-Elect, three Vice Presidents, Secretary, Treasurer, eight Members of the Council for two-year terms. All members of the Association are invited to submit suggestions to the Chairman or other members of the Nominating Committee.

J. David Singer, University of Michigan, Chairman
Hayward R. Alker, Jr., Massachusetts Institute of Technology
Frederic N. Cleaveland, University of North Carolina
Duncan MacRae, Jr., University of Chicago
John C. Wahlke, University of Iowa
Sheldon S. Wolin, University of California, Berkeley

TRAVEL GRANTS IPSA WORLD CONGRESS

Munich, Germany
August 31 to September 5, 1970

The Association has received a grant of \$10,000 from the National Science Foundation to assist American political scientists in travel to the International Political Science Association Congress in Munich, Germany, August 31 to September 5, 1970. Grants are limited to travel costs.

Application forms are available from the Association office. The deadline for receipt of applications will be June 1, 1970. An Association committee will make the grants and notify individuals soon after that date.

Write to: Travel Grants, IPSA Congress
American Political Science Association
1527 New Hampshire Avenue, N. W.
Washington, D. C. 20036

EUROPEAN FLIGHTS

TRAVEL - STUDY OPPORTUNITIES

For the eleventh successive summer, the Association is arranging two flights to Europe in 1970. Flight A will leave New York June 10 for London, and return September 7. The A Flight will be by Pan American and will cost \$245.00. Flight B will leave New York for Paris August 1 on Pan American, and will return September 7. The cost for Flight B will be \$270.00.

Reservations are being accepted on a "first come, first served" basis. These flights are open only to members of the Association and their immediate families. Contact the Association for further information.

Washington, D.C. 20036

APSA FLIGHT TO INTERNATIONAL POLITICAL SCIENCE ASSOCIATION

8th World Congress, August 31 to September 5th, 1970

Munich, Germany

Members of the American Political Science Association are invited to participate in a group flight to Munich, Germany leaving JFK International Airport in New York August 22 and returning September 7, 1970. The fare will be \$245.00 on Lufthansa German Airlines.

Persons wishing to make reservations now may write directly to the Association, in care of the Director, Summer Flight Programs, 1527 New Hampshire Avenue, N. W., Washington, D.C. 20036.

GROUP FLIGHTS TO LOS ANGELES

for 1970 APSA Annual Meeting

September 8-12

The association has arranged group flights from several cities to Los Angeles for the APSA Annual Meeting, September 8-12, 1970. The group fares are the same as excursion fares, but the regulations will permit individuals to return any day of the week and in less than seven days.

The fares for these flights are based on a minimum of 25 participants on regularly scheduled airlines:

New York-Los Angeles	September 7 (Evening)	\$238.35
New York-Los Angeles	September 8 (Morning)	\$238.35
Boston-Los Angeles	September 8	\$248.85
Washington-Los Angeles	September 8	\$226.80
Chicago-Los Angeles	September 8	\$170.55
Atlanta-Los Angeles	September 8	\$193.20
Seattle-Los Angeles	September 8	\$109.20

Each group is required to depart together, but passengers may return individually according to their own wishes. The only requirement is that they reserve a direct flight back on the same airline. These flights are open only to members of the Association and their immediate families. For more information and application forms, write to:

Politics and Policy:

The Eisenhower, Kennedy, and Johnson Years

by James L. Sundquist

"I am tremendously impressed by Sundquist's book on public policies under the Kennedy and Johnson administrations. The way he has gone about not only developing the policies themselves, but putting them into a political context and indicating possibilities of improvement and reform, make this a highly useful book both for the general public and for students." James MacGregor Burns

1968 560pp paper \$3.50 cloth \$8.75

Making Federalism Work:

A Study of Program Coordination at the Community Level

by James L. Sundquist,

with the collaboration of David W. Davis

In this study of community development programs in urban and rural communities across the country, the authors examine the central problems of coordination of intergovernmental programs that have been the source of confusion and conflict at all levels of government. Out of this examination several series of recommendations are developed which, taken together, would constitute a system of coordination for the federal structure as a whole.

1969 293pp paper \$2.95 cloth \$6.95

Congress and Urban Problems:

A Casebook on the Legislative Process

by Frederic N. Cleaveland and Associates

The seven legislative studies in this book focus on problems associated with urban living and the efforts of Congress in the 1950s and 60s to cope with them. Each study provides answers to three major questions: What are the sources of legislative initiative in dealing with urban problems? How do congressmen view urban affairs legislation? What patterns and influences dominate congressional voting behavior on urban issues?

1969 405pp paper \$2.95 cloth \$7.50

A World of Nations: Problems of Political Modernization

by Dankwart A. Rustow

"A first-rate comparative analysis of modernization as a political phenomenon . . . empirically solid and written in good clear English happily devoid of technical jargon." *Foreign Affairs*

1967 306pp paper \$2.95 cloth \$7.95

Development Assistance in the Seventies:

Alternatives for the United States

by Robert E. Asher

This timely book presents a comprehensive analysis of U.S. financial and technical assistance to low-income countries, and of trade and private investment policies for promoting development, in the light of changes in the international environment since the aid program took shape two decades ago. The author contends that a fresh approach to development assistance is needed in the 1970s for reasons more fundamental than the fact that new administrations like to take new initiatives. Although he recommends specific changes in the nature, scope, and organization of development assistance, his aim is to interpret and analyze rather than prescribe, thus enabling the reader to reach conclusions of his own.

Spring texts from Praeger

AN INTRODUCTION TO COMPARATIVE GOVERNMENT

Jean Blondel. Commenting on this brilliant new text — the first successful attempt to provide a systematic conceptual approach to the study of comparative systems — *The Times Literary Supplement* writes: "The size of the project, the originality of the approach, and the fertility of the author's mind combine to guarantee its importance. It will rank with Bryce and Finer and Friedrich in the roll-call of comparative government classics." 1970. 568 pp. \$10.50

HOW NATIONS BEHAVE: Law and Foreign Policy

Louis Henkin. From the reviews of the hard-bound edition, now being made available in paperback in response to many requests: "A very fine argument for the study of international law." — *Choice*. "Cogent. . . . The general reader and the scholar would each profit by exposure to Mr. Henkin's arguments." — *Library Journal*. Published for the Council on Foreign Relations. 1968. Paper: March, 1970. 336 pp. \$7.50, cloth, \$3.50, paper

THE MAYOR'S GAME

Allan R. Talbot. This perceptive study of a mayor in action, first published in 1967, is now being reissued in paperback with a new introduction and epilogue placing the New Haven experience — as testing ground for many of the new domestic programs of the Kennedy and Johnson Administrations — within the broader framework of the nation's urban crisis. "Sophisticated and informed." — *The Wall Street Journal*. 1970. 298 pp. \$2.95 (paper only)

MAN, STATE, AND SOCIETY IN CONTEMPORARY SOUTHEAST ASIA

Edited by Robert O. Tilman. "Excellent background reading about man and his relations with his political and social environment in Southeast Asia. Will be most useful and is highly recommended to students of Southeast Asia and interested laymen." — *Library Journal*. 1969. 544 pp. \$13.50, cloth, \$5.95, paper

THE UNITED STATES AND CHINA: The Next Decade

Edited by A. Doak Barnett and Edwin O. Reischauer, with the assistance of Lois Dougan Tretiak. The many distinguished contributors to this volume (which is based on a conference sponsored by the National Committee on United States-China Relations, a nonpartisan organization) provide thoughtful, diverse discussions on every aspect of relations between the U.S. and the Chinese People's Republic. Published in cooperation with the National Committee on United States-China Relations. April, 1970. 272 pp. \$7.50, cloth, \$2.95, paper

MODELS OF POLITICAL CHANGE IN LATIN AMERICA

Edited by Paul E. Sigmund. Latin America is currently caught up in the debate over whether to speed up economic development and promote social and political reform via constitutional governments, revolutionary change, or military rule. This unique text — a collection of documents, speeches, and articles consisting mainly of translations from Spanish and Portuguese — now provides students with unparalleled basic source material on this debate. June, 1970. ca. 352 pp. ca. \$9.00, cloth, ca. \$3.95 paper

What are the vital internal forces and political structures which have characterized India's transformation in the Third World?

How do Algeria, Morocco, and Tunisia compare in terms of political development?

POLITICS IN INDIA

Rajni Kothari

Centre for the Study of Developing Societies, New Delhi, India

Two neglected dimensions of political analysis, institutional analysis and the role of the elites, are emphasized in explaining how democratic politics is proving to be the great creative force in the development of India's "open" political system. Professor Kothari argues that the role of the elite is critical in establishing a dominant political "center" – an establishment in which diverse groups and individuals can compete and ally – in the midst of the plural identities and segmented distances that characterized Indian civilization for centuries.

The book employs a modified structural-functional approach, as do all the Series books, for comparative use with other books in the Series.

Paperbound / 480 pages / \$4.50 / just published

POLITICS IN NORTH AFRICA

Clement Henry Moore, *University of California, Berkeley*

The contemporary political systems in these three North African states are analyzed with respect to their sources and types of legitimacy, their elite structures, their respective performances, demands placed upon them, and strategies for coping with these demands and the various groups that articulate them.

The author argues that despite common cultural and socio-economic factors that condition political processes throughout the Maghrib, the systems display remarkable differences in political structure. He explains these differences in light of contrasting patterns of colonial rule and anti-colonial struggle. Prospects for political development and/or decay within and between the three states are also discussed. Students in two of the three countries were specially surveyed for this study.

Paperbound / 384 pages / \$4.50 / just published

also available in the Series are the following Country Studies: England, France, Germany, USSR, Israel, Philippines, Japan, Republic of South Africa.

**Have you considered the contemporary political system in
Europe on a comparative basis?**

EUROPEAN POLITICS
A Comprehensive Reader

Richard Rose, Editor
Strathclyde University, Scotland

Mattei Dogan, Editor
Centre d'Etudes Sociologiques, Paris

The object of this original anthology is to provide an introduction to the major problems of contemporary political sociology in modern Europe. Represented in this one-volume work are articles consistent with the best standards of international social science, some of them previously untranslated pieces drawn from the writings of European scholars.

CONTENTS

**Has life in the American city improved for more of America's
urban population over the years and decades?
or has life in the American city become worse for more people?**

THE UNHEAVENLY CITY
The Nature and Future of our Urban Crisis
Edward C. Banfield, *Harvard University*

If it can be shown that life has become relatively better, then the "crisis" approach to urban affairs is obviously a self-deluding and divisive one. If life has become relatively worse, in what ways has it become worse and are our present programs in urban reform attacking the roots of the problem?

The Unheavenly City directly challenges the view that today's cities are in decline and that America is losing the battle against poverty, social disadvantage, and racial discrimination. Banfield contends that conditions of life in urban America *have* improved dramatically during recent years. What has not improved is our capacity to keep pace with the accelerating expectations of the urban dweller – expectations legitimate in origin but too often divisive and self-defeating in expression.

Education, housing, transportation, crime and punishment, minimum wage laws, the negative income tax, rioting and race – *The Unheavenly City* is concerned with the urban problem in all its aspects. By redefining the problem, the book offers new hope for its eventual solution.

Paperbound / 320 pages / Available for examination

What is the role of the congressional minority party? of the House Ways and Means Committee?

MINORITY PARTY LEADERSHIP IN CONGRESS

Charles O. Jones, *University of Pittsburgh*

Here is a focus on one of the principal institutions of opposition in the United States – the minority (or second) party in Congress. There are vast differences between minority parties in terms of the range of strategies available for participating in congressional decision-making. This book identifies three principal types: restricted, participating, unrestricted minority parties; classifies all congresses in this century; and discusses the actual behavior of minority parties in the House and the Senate in this century.

Cloth / 240 pages / Summer 1970

THE HOUSE COMMITTEE ON WAYS AND MEANS

John F. Manley, *University of Wisconsin*

The study of the House Ways and Means Committee herein spans the years from the New Deal to the Nixon Administration. The emphasis is on both the internal relations of the Committee and the Committee's relations with the House, Senate, President and pressure groups.

Special attention is paid to the Committee Chairman, Wilbur D. Mills, and to the policy-making process involving taxation, social security (Medicare), and international trade.

Cloth / 416 pages / Summer 1970

Both are new volumes in the Study of Congress series, directed by Ralph K. Huitt.

RUSSELL SAGE FOUNDATION TITLES

THE UNEASY PARTNERSHIP: Social Science and the Federal Government in the Twentieth Century

GENE M. LYONS

The role of the social sciences in shaping public policy has attracted much attention and some criticism in recent years. This book argues for strengthening the role of the social sciences in federal government and calls for a central social science organization and better integration of research within federal agencies.

1969 394 pages \$8.50

SURVEY RESEARCH IN THE SOCIAL SCIENCES

Edited by CHARLES Y. GLOCK

Survey research—now practiced in all the social sciences and most related disciplines—varies greatly in amount and quality. Problems range from failure to comprehend the logic of survey analysis to misuse of that logic through application of inappropriate statistics. This book was written to speed wider and wiser use of the method.

1967 543 pages \$9.00

THE MILITARY INTERVENES *Case Studies in Political Development*

HENRY BIENEN, Editor

The case studies reported here explore the mechanisms of military intervention and its consequences. The contributors examine a succession of coups, attempted coups, and established military regimes with a view to evaluating the role of the military as a ruling group and as an organization fostering political development.

1968 175 pages \$7.00

announcing

CANFIELD PRESS

A Department of Harper & Row, Publishers

Are your students satisfied with your course? An unfair question? All right, are they satisfied with the texts they're using now? Are you?

Canfield Press has been asking these questions of students, faculty, and ourselves. We're particularly concerned with student needs during the first two years of college, since more and more students are ending their formal education at this point.

We are committed to developing books and related teaching materials relevant to your courses, to presenting difficult concepts and techniques in understandable steps for learning, and to motivating the student with content pertinent to his world.

We are further committed to continuing the quality of Harper & Row's 150 years of publishing tradition, but as a young publisher, we feel that our future depends on our ability to respond to tomorrow's educational needs today. We think our first list is a step in this direction. Described below are three of our first publications.

THE FIBER OF DEMOCRACY: Readings in American Government and Politics

Edited by **WILLIAM E. BRIGMAN AND JOHN S. VANDEROEF** / Selections included in this volume are both provocative and informative. They were drawn from two sources: the work of recognized scholars and the writings of men who have been active in the American political process. Thus, Arthur Schlesinger, Jr. and Richard E. Neustadt write about presidential power; thereby, integrating theory and practice and description and analysis into an especially meaningful presentation. The contributors represent diverse viewpoints, permitting exposure to various approaches and encouraging lively class discussion. *March, 1970. Paper. Tentative: 450 pp.; \$4.95*

DIVIDED WE STAND

Edited by **THE EDITORS OF RAMPARTS** with the advice of **RICHARD H. DODGE** / Drawn from the most recent issues of *Ramparts*, here is a timely collection of the best writings on current sociopolitical issues. Selections are grouped in five sections: All Men Are Created Equal; Certain Inalienable Rights; Life, Liberty; and The Pursuit of Happiness. Among the contributors: Harry Edwards, David Horowitz, Susan Sontag, Eldridge and Kathleen Cleaver, Peter Collier, Paul Ehrlich, Karl Hess, and Nathan Hare. *Instructor's Manual by Richard H. Dodge. March, 1970. Paper. Tentative: 200 pp.; \$3.50*

CALIFORNIA GOVERNMENT, Third Edition

LEROY C. HARDY / This concise presentation of the basic facts about California government has been extensively rewritten and updated. The new edition covers, first, essential background material; next, the structural form; then, the behavior and practices of the legislative, executive, and judicial institutions; and finally, the reforms of each branch. Perhaps most importantly, there is included a new chapter on current issues and problems. *Instructor's Manual. May, 1970. Paper. Tentative: 150 pp.; \$2.50*

Essential reading from Basic Books

Toward a National Urban Policy

Edited by Daniel P. Moynihan

In an authoritative assessment of the crisis in our cities, leading experts—including Daniel P. Moynihan, Robert Wood, Nathan Glazer, Wolf von Eckardt, Thomas F. Pettigrew, Lee Rainwater, Martin Meyerson, and James Q. Wilson—address themselves to the key areas of urban concern, from housing to transportation and from crime to education. This is as comprehensive and incisive an evaluation of what is being done—and what can be done—to improve the quality of urban life as the complexity of the subject will allow. "The talents of the contributors to this work are singular; I do not believe a more distinguished combination of intellect and experience is to be found in this field."—Daniel P. Moynihan

April/\$7.95

People in Politics

By Richard Rose

This witty and informative book brings together the perspectives of citizens, politicians, and social scientists in a discussion of the major problems of governing the United States and Britain. A leading political scientist, Professor Rose discusses such central questions as: Why are early influences more likely to determine the political attitudes of voters than of politicians? Why do people who feel they exert little influence on government vote anyway? What do politicians actually do and what do they—and citizens—think they do? No one interested in politics as practiced on both sides of the Atlantic can afford to miss this book.

April/\$5.95

The Political Order

Edited by Henry S. Kariel

This valuable reader explores the wide range of choices in which established and often conflicting ideologies, institutions, and modes of study respond to contemporary challenges. The emphasis is upon the ways by which political thinkers understand and cope with events, rather than upon a presentation of set conclusions.

March/\$10.00

paperback classroom edition/\$4.95

The Modern Public Sector

New Ways of Doing the Government's Business

By Murray Weidenbaum

A leading economist, currently Assistant Secretary of the Treasury for Economic Policy, weighs the political as well as economic implications of certain profound changes in the ways the government conducts its business. This pioneering book shows how Federal programs are increasingly being delegated to private industry, state and local governments, and "non-profit" organizations. The revenue-sharing plan and the containment of the military-industrial complex are authoritatively discussed.

New/\$5.95

Authoritarian Politics in Modern Society

The Dynamics of Established One-Party Systems

Edited by Samuel P. Huntington and Clement H. Moore

In this first book to focus exclusively on the problems of one-party systems, fourteen authorities consider the individual experiences of the major one-party states and analyze the different ways in which they handle such problems as legitimacy, leadership, and political and social change.

May/\$12.50

Academia in Anarchy

An Economic Diagnosis

By James M. Buchanan and Nicos E. Devletoglu

Two leading economists discuss the causes and cures for student disaffection, poor faculty performance, irrelevant curricula, and other manifestations of "academic anarchy."

March/\$5.95

The Future of Inequality

By S.M. Miller and Pamela Roby

In the belief that poverty is an issue of inequality rather than of mere physical survival, the authors examine the hidden dimensions of social stratification. Approaches for meeting the social problems in the future are examined.

March/\$8.95

Political History

Principles and Practice

By G.R. Elton

The author, Professor of English Constitutional History at the University of Cambridge, provides a brilliant analysis of the craft of writing political history.

April/\$5.95

Economics and Urban Problems

By Dick Netzer

The Dean of the NYU Graduate School of Public Administration shows how the tools of economic analysis can help the decision-maker cope with urgent city problems.

February/\$5.95

Our complete list of new political science titles will appear in forthcoming issues of *P.S.* and *APSR*.

Please mention *THE AMERICAN POLITICAL SCIENCE REVIEW* when writing to advertisers

For years, the Institute for Scientific Information (ISI®) has been providing scientists with the information they need—in the form they need it. Now, you and your colleagues in the behavioral, social and management sciences can take advantage of ISI's vast data bank of over 4,000 domestic and foreign journals to keep you up-to-date on what's being published in your field.

Let your next journal be *Current Contents®—Behavioral, Social & Management Sciences*

For your general need to be aware of what's going on in your field, ISI publishes *Current Contents—Behavioral, Social & Management Sciences*. Subscribers to this pocket-sized weekly receive, often in advance of publication, reproductions of table-of-contents pages of over 900 domestic and foreign journals in the behavioral, social and management sciences. And an exclusive author-address directory.

Another invaluable ISI® service: *Automatic Subject Citation Alert*

If your areas of concern can be more specifically defined, ISI's Automatic Subject Citation Alert (ASCA®) will alert you, on a weekly basis, to any materials published on topics which fall within your personally-programmed interest profile areas.

And get as a bonus *Original Article Tear Sheet Service*

ISI's Original Article Tear Sheet Service (OATS®) can provide subscribers to either of the above two services any article desired on a 24-hour turn-around basis.

Keeping up with all those journals you don't have time for is easy when you subscribe to one or more of the comprehensive services ISI has designed for busy social or behavioral scientists. Write for details today. ©1970 ISI

POLITICS AND GOVERNMENT IN THE UNITED STATES

Second Edition

EMMETTE S. REDFORD, UNIVERSITY OF TEXAS

DAVID B. TRUMAN, MOUNT HOLYOKE COLLEGE

ALAN F. WESTIN, COLUMBIA UNIVERSITY

ROBERT C. WOOD, MASSACHUSETTS INSTITUTE OF TECHNOLOGY

This Second Edition of *Politics and Government in the United States* is a thorough revision of a successful introduction to American government. While retaining the high level of analysis and authoritative scholarship that characterized the earlier volume, this edition incorporates the latest research in political science and takes into account recent political events. The text narrative is 30 percent shorter than the previous edition, although no major substantive topics have been dropped. New part introductions, chapter introductions, and chapter summaries highlight key political concepts and emphasize the analytical framework of the book. With a new program of boxed inserts and new, up-to-date political cartoons. Instructor's Manual and Test Booklet available.

National, State, and Local Edition: 964 pages. \$9.95

National Edition: 835 pages. \$8.95

THE COLD WAR YEARS **American Foreign Policy Since 1945**

PAUL Y. HAMMOND

Written in an informal, engaging style, this book is a brief interpretative synthesis of American foreign policy since the Second World War. The text narrative is organized by Presidential administrations, and each chapter proceeds by functional topics rather than chronologically. This organization reflects the author's analytical framework and allows him to emphasize the distinctive characteristics of an administration's foreign policy and the influence of domestic factors on foreign policy. An extensive bibliographical essay is included at the end of the book.

Paperbound. 270 pages. \$2.95

INDIA

Government and Politics in a Developing Nation

ROBERT L. HARDGRAVE, JR., UNIVERSITY OF TEXAS AT AUSTIN

Written during the events of 1969 that opened a new era in Indian politics, this brief textbook aims to introduce beginning students to the concepts and problems of political development and to relate the problems of India to the broader perspective of developing nations. The book focuses on both structure and process, on both institutions and behavior; it provides a sense of the cultural and historical setting in which political development takes place, analyzes recent events, including the Congress party split, and raises issues that are likely to be crucial to India's political future. Perhaps more than any other developing nation, India dramatizes the crisis posed by the limited capacity of institutions to respond to expanding participation and increasing demands, and therefore provides an appropriate framework for the exploration of problems of political development that confront a major portion of the world.

WESTERN POLITICAL THEORY

From Its Origins to the Present

LEE CAMERON McDONALD, POMONA COLLEGE

A history of political theory from Plato to the present, this book provides in-depth discussions of the most important theorists in each historical period. Professor McDonald's presentation and style lead the student into the original works; his explanations of each thinker's point of view, complemented by quotations from the original work, give the student a first-hand acquaintance with each man's ideas, as well as his style, his approach to life, and the age in which he lived.

Roots of Rebellion
THE EVOLUTION OF BLACK POLITICS AND
PROTEST SINCE WORLD WAR II
RICHARD P. YOUNG

"The selections in this reader trace the development of black protest from the 1940s, when Jim Crow practices were the rule even in the North and most Negroes played roles of accommodation, to the present period of black pride and rebellion against the status quo. The writing of sociologists, political scientists, psychologists, and psychiatrists, black and white, have been included to explain this development. However, the perspective of this reader is not exclusively that of the social sciences. The writings and speeches of leading figures of both the 'Negro Revolution' and the contemporary black revolutionary movement have been included to provide a balance between the views of those who observe social phenomena and those who are political actors."—from the PREFACE / General and section introductions by the editor. ALDINE

is pleased to announce
the most contemporary and relevant text available today for courses in foreign policy and international relations.

GREAT ISSUES OF INTERNATIONAL POLITICS

edited by Morton A. Kaplan, University of Chicago.

This book of readings brings excitement and relevancy to the study of international politics and foreign policy through controversial analyses of the most pressing issues of our times—arms control, United States-Communist relations, limited warfare, American intervention, and military security. It concentrates on the most vigorous contest of contemporary international issues as they relate to national values and characteristics of international political structure, and provides students with a lively and compelling means of analyzing current foreign policy and whether this policy is or is not based on principle.

The book is divided into three parts. Part one provides evaluations of the structure of international political systems, organization and law, and discussions of the extent to which justice, order and law can be reconciled. The second part deals with great issues of foreign policy, debated by Senator Frank Church, Senator J. William Fulbright, Henry A. Kissinger, Ambassador Averill Harriman, Albert Wohlstetter and the author. Part three places the military issues of the arms race and ballistic missile defense in the context of strategy, bargaining, and war.

Throughout the book, opposing points of view are placed side-by-side to provide students with a point of departure for discussing critical issues of contemporary foreign policy. Thus, international political structure and foreign policy are illuminated through incisive debate on the vital issues of the day. And although the specific issues which are dealt with here may pass, the underlying problems of which they are particular manifestations will continue to recur. Hence students are also provided with important insights into how one evaluates and deals with principles of political structure and their manifestation in policy.

480 pp. Clothbound, \$12.50. Paperbound, \$4.95.

REBELLION AND AUTHORITY

An Analytic Essay on Insurgent Conflicts

by NATHAN LEITES and CHARLES WOLF, Jr. The RAND Corporation

The broad aim of this book is to develop a method of analyzing insurgent conflicts—conflicts between Authorities and Rebellions—which approaches the rigor achieved in analysis of strategic nuclear conflicts. Various concepts are developed, such as the “demand” for and “supply” of rebellion; the “inputs” and “outputs” associated with rebellion; “damage-limiting” and “profit-maximizing” influences on population behavior; and the principles of target-selection as they affect the contesting sides. The concepts are then applied to specific recent cases of insurgent conflict.

THE AMERICAN THREAT

The Fear of War as an Instrument of Foreign Policy

by JAMES L. PAYNE Wesleyan University

The author presents a powerful argument to the effect that statesmen and political analysts must acknowledge and use intelligently the implicit threat of war present in most situations of political conflict between nations. Professor Payne emphasizes the important difference between the average citizen's perception of an international conflict and the responsibility of the professional statesman to confront the full reality of these situations when making foreign-policy decisions. The book offers no specific policy recommendations, but provides considerable historical enlightenment on how and why the United States becomes involved in situations as complex and frustrating as Vietnam.

CONFLICT OF INTEREST

A Theory of Divergent Goals with Applications to Politics

by ROBERT AXELROD University of California, Berkeley

Conflict of interest is the state of incompatibility of the goals of two or more actors. This study provides a formal definition of conflict of interest for certain types of strategic interactions and applies the concept to the analysis of several political arenas. The book explores specifically the bargaining process in Congressional conference committees, the multilevel decision process in bureaucracies, consensus and cleavage in societies, and the processes of coalition formation and maintenance in parliamentary democracies.

POLICY ANALYSIS IN POLITICAL SCIENCE

by IRA SHARKANSKY University of Wisconsin

This reader is a collection of articles which illustrate the various ways political scientists analyze public policies with sophisticated tools. There is a general introduction by the editor, followed by chapters on alternate models of the policy process, measurement of policy, influences on policy-makers, and approaches to policy change. The selections explore policy processes in all levels of government and deal with a variety of policy issues, such as budgeting, reapportionment, and the selective service system.

LOOKING FOR A BOOK PUBLISHER?

It is no secret that publication is regarded as the foundation stone of a scholar's career. In order to gain recognition, prestige, and advancement, the scholar must seek publication.

Here at Exposition Press, we offer scholars a complete publishing service, under our special academic imprint, "Exposition-University Books." Though the proportion of scholarly publications in the lists of the trade houses is shrinking, due to economic pressures, many of our recent titles in the academic fields have gained popular reviews, professional recognition and steady sales. These books are the result of a publishing plan that is bringing a steady flow of scholarly writers to Exposition Press. They reflect the high editorial standards and quality of design and production which have won the respect of libraries, schools, book-sellers and critics. Publication is rapid; within four months! Ask for free catalogs.

FREE! The behind-the-scenes story of book publishing revealed in two fact-filled, illustrated brochures, containing a detailed description of our subsidy plan including a breakdown of contract terms and typical costs (in print for the first time). Copies are available on request. Your inquiries and manuscripts are invited. An editorial appraisal will be furnished promptly without obligation. References upon request.

THE EFFECT OF JUDICIAL REVIEW ON FEDERAL-STATE RELATIONS IN AUSTRALIA, CANADA, AND THE UNITED STATES

Richard E. Johnston

One of the first books to examine the various aspects of modern federalism. Professor Johnston investigates the effects of judicial review on federal-state relations in three nations with surprisingly similar constitutions. He makes a comparison of the manner in which the highest courts of these nations have treated such problems of federalism as foreign affairs, treaties, spending, taxation, and intergovernmental immunities. This volume will be valuable for students of comparative government and constitutional law, and will provide much useful information for students of political science generally.

THE LIMITS OF INTERVENTION

by Townsend Hoopes

This highly pertinent book discusses the roots of United States military involvement in Vietnam and relates the events that occurred within the government after the Tet offensive, when President Johnson acceded to a full review of our Vietnam policy. It is written by a man who since 1947 has held various positions in the upper echelons of government, serving in recent years as Deputy Assistant Secretary of Defense for International Security Affairs and Under Secretary of the Air Force.

"Written with courage, intelligence and hope . . . a superb source of information about how American foreign policy is actually being made—and it also shows in what ways an aroused public opinion can finally compel a President to change his course."

Karl W. Deutsch, Harvard University

" . . . an intellectual necessity for all concerned with the liquidation of an unparalleled disaster . . . far and away the most illuminating account we have of the people and policies that led the United States into the Vietnam catastrophe . . . a significant contribution to the history of our times."

Arthur Schlesinger, Jr., City University of New York

" . . . probably the finest thing of its kind in the literature of American politics . . ."

The New Yorker

"Hoopes' book is a valuable contribution to the literature on the politics of policy-making and I certainly intend to use it in my classes."

Roger Hilsman, Columbia University

**Things are
happening
fast at
17 Dunster
Street**

You've probably heard about us.

We're the new publishing company created to meet the challenges of the current college education scene. We believe that the dynamic changes now taking place at all levels of the curriculum as well as the diverse backgrounds of today's college students call for innovative responses from teacher and publisher alike. So—with the Social Sciences and Humanities as our area of specialization—we are experimenting with new and different teaching materials for today's new courses and new kinds of students. We bring thirty years of publishing experience to WINTHROP—to what we feel is a fresh, progressive publishing venture.

**Soon we'll be officially
announcing our first Political
Science books.**

Right now we can tell you that one volume examines the role of state and federal governments in alleviating both urban and rural poverty. Written by experts in the field, this book criticizes government response to the poverty problem and provides a tested blueprint for more constructive government action. The second volume, a reader on international conflict in the nuclear age, consists of a series of paired essays, each offering alternative analyses of the conflicts in Vietnam, Korea, the Middle East, and other world trouble spots.

LAWS AND MEN

The Challenge of American Politics

By the late **DANIEL M. BERMAN** and **LOUIS S. LOEB** of American University

Beginning where politics begins—with people—*Laws and Men* develops an understanding of how individuals relate to politics and of how they are motivated. Descriptive, analytical and interpretive, the book includes all basic material—parties, interest groups, and the policy making institutions and processes—but goes beyond description to take a critical look at American politics. The text, designed for courses in American government, is divided into 14 chapters. It answers the plea for human relevance in the study of political behavior and institutions.

**GOVERNMENT
BY THE PEOPLE:
NATIONAL, STATE AND
LOCAL,
SEVENTH EDITION,
1969**

A new vital
revision of
the leading
introductory
text in
American
Government
emphasizing the
issues of the 1970's.

and its
companion text . . .

James M. Burns, Williams College; and
Jack Walter Peltason, University of Illinois.

Burns and Peltason have done an intensive job of updating, but also of giving the Seventh Edition a fresher viewpoint and sharper emphasis.

Extensively rewritten to take into consideration the kinds of issues and problems that readers of *Government By The People* will be dealing with in the decade ahead.

The 7th Edition clearly recognizes the "challenge to democracy" from many students and other Americans in recent years.

SPECIFIC IMPROVEMENTS

- Emphasizes the use of the latest scholarship especially in the fields of civil rights, political behavior; the President, and Congress, and the Supreme Court; and in the discipline of political science, for the benefit of teacher and student alike.
 - The first chapter is totally recast and deals with the critique of "pluralist democracy."
 - Offers a coherent coverage of American Government.
 - The authors aim to involve the student, to be relevant, but not to talk down.
 - Completely up-to-date—includes election results and the impact and consequences of the 1968 elections, civil rights and black power, reapportionment and urban crisis, alienation and democracy, the crisis of confidence in Vietnam, and attacks on the defense of democracy from both the left and the right.
- Nat'l Edition, 1969, 704 pp. (36064-4) \$9.50
Nat'l & State & Local Edition, 1969, 848 pp. (36065-1) \$9.95

**GUIDE TO AMERICAN GOVERNMENT
THIRD EDITION, 1969**

James A. Burkhart, Stephens College;
Raymond L. Lee, Indiana University of
Pennsylvania.

Revised especially for the Seventh Edition of *Government By The People*. It continues to be completely integrated with the text. A guide to the efficient, intelligent study of political science.

Through objective questions (true-false, multiple choice, matching, completion), *Guide To American Government* provides the student and the instructor with a check on the fundamental facts. The questions in the workbook are carefully thought out, imaginative and practical. They indicate whether the basic materials have been mastered, and initiate independent thinking on the part of the student. *An answer guide is available.* 1969, 213 pp. paper (36695-5) \$3.95

Southeast Asia Tomorrow

Problems and Prospects for U.S. Policy

MELVIN GURTOV In this important RAND study, Melvin Gurtov disputes the "domino theory" that U.S. withdrawal from Vietnam without total victory will result in a rash of Communist-sponsored liberation wars, increased militancy in Peking, and an overall erosion of security and stability in Southeast Asia. He discusses the likely responses of America's Asian allies to U.S. withdrawal and how its adverse effects can be minimized. \$6.95 cloth, \$1.95 paper

The Supreme Court and the Electoral Process

RICHARD CLAUDE In recent years the Supreme Court has moved ahead of Congress and the Executive in a controversial attempt to "nationalize" the electoral process. Professor Claude's unique study brings together and analyzes the cases heard by the court during the past 100 years which have most influenced voting rights and representation. He offers valuable insights into the role of litigation in the democratic process and indicates those issues most likely to be the subject of future litigation. \$10.00

Announcing a new series

Policy Studies in Employment and Welfare

Written in a lively and non-academic style, the books in this new series will focus on the major domestic issues of our time—the urban crisis, poverty, and employment.

Economic Opportunity in the Ghetto

The Partnership of Government and Business

SAR A. LEVITAN, GARTH L. MANGUM, and ROBERT TAGGART, III What hope is there for revitalizing the economies of our city ghettos? This study analyzes recently initiated efforts by government and business to open existing inner city jobs to ghetto residents, to create new jobs in the ghetto, and to promote local ownership of ghetto business. \$6.00 cloth, \$1.95 paper

Programs in Aid of the Poor for the 1970s

SAR A. LEVITAN An ideal introduction for anyone who wants to know what this country is doing for the poor, this study discusses the three kinds of programs which constitute the federal welfare system—programs to assist the unemployed poor, programs to assist the working poor, and programs supplying goods and services. \$6.00 cloth, \$1.95 paper

Manpower Challenge of the 1970s

Institutions and Social Change

STANLEY H. RUTTENBERG, assisted by JOCELYN GUTCHESS Drawing on his four years as Manpower Administrator, Mr. Ruttenberg shows how institutional shortcomings and interagency rivalries weakened our national manpower programs. He describes the unsuccessful effort by former Labor Secretary Wirtz and himself to reorganize the Manpower Administration and goes on to outline a model manpower system and recommend new and comprehensive manpower legislation. \$6.00 cloth, \$1.95 paper

What is New About the Sixth Edition of

PRINCIPLES OF AMERICAN GOVERNMENT, Sixth Edition, 1970

Albert B. Saye and Merritt B. Pound, both of
the University of Georgia; and John F. Allums,
Office of Emergency Preparedness.

This sixth edition, of a standard in its field, features an expanded introductory chapter on judicial review, a section on contemporary problems and the role of the cities, and a section on recent Supreme Court cases on civil rights. The authors maintain the objective of the original edition—presenting a concise, straightforward account of the basic features of American government, with emphasis on constitutional principles. A complete teacher's manual is available on request.

March 1970, approx. 496 pp. (70476-7) \$7.95

Features

- The introductory chapter—expanded to provide a general introduction to political science, including behavioralism.
- The chapter on judicial review, offering a critical analysis of its operation.
- Contemporary problems and the role of the cities—included in the Chapter on Federalism.
- Includes recent Supreme Court cases on civil rights.
- Education, housing, and space research—included in the Chapter on Functions and Service.
- Reapportionment, constitutional revision and other current problems of State and Local Government are presented.

Karl W.

DEUTSCH

Harvard University

POLITICS AND GOVERNMENT:

How People Decide Their Fate

A basic text for the introductory political science course, Dr. Deutsch's book balances the comparative, normative, and behavioral approaches. It presents the basic principles that govern political thinking and then applies these concepts to the political systems of five countries: the United States, the U. S. S. R., Britain, France, and West Germany. Throughout the book there are numerous examples from American political life, as well as comparisons among the experiences of many different countries. Key concepts for review and discussion are listed at the end of each chapter. Analytical in approach and well supported with quantitative data and historical examples, the book encourages students to form their own views of major political problems.

**THE THEORY AND
PRACTICE OF INTERNATIONAL
RELATIONS, 3rd Ed., 1970**

Fred A. Sondermann, Colorado College;
William C. Olson, Columbia University; and
David C. McLellan, University of California,
Riverside.

Completely up-dated 80% new selections by
eminent authorities in the field, and includes
revised textual commentary.

April 1970, approx. 448 pp., paper (91337-6)
\$4.95 cloth (91338-4) \$8.95

TODAY'S ISMS:

**Communism, Fascism, Capitalism,
Socialism, 6th Ed., 1970**

William Ebenstein, University of California,
Santa Barbara.

Completely revised and introduces new material on political, economic, and cultural studies of the Brezhnev-Kosygin regime; views world-wide implications of Sino-Soviet conflict and Soviet penetration of the Arab world; discusses Negro attitudes toward socialism and capitalism, and more.

February 1970, 320 pp., illus., paper (92442-3)
\$3.50 cloth (92443-1) \$6.95

**PROBLEMS IN INTERNATIONAL
RELATIONS, 3rd Ed., 1970**

Andrew Gyorgy, George Washington
University, Hubert S. Gibbs, Boston University,
and Robert S. Jordan, George Washington
University.

Timely, concise, and applies the case method to contemporary international relations. Most cases are new—with focus on selected geographic areas (Eastern Europe, Latin America, The Middle East) or on important problems such as the role of the military in politics, the U.N., etc. Illustrated with maps, charts, cartoons, and drawings.

May 1970, 384 pp., paper (71742-1) \$5.50

**FOUR AFRICAN
POLITICAL SYSTEMS**

Christian Potholm, Vassar College.

One of the first in-depth comparative surveys of four African countries by a single author. The analysis of each nation is based on decision making, systematic capabilities, and goal

formation. A major chapter introduces "The African Context."

April 1970, approx. 320 pp., (32959-9) \$8.95

GOVERNING IN BLACK AFRICA:

Perspectives on New States

Edited by Marion Doro, Connecticut College
and Newell M. Stultz, Brown University.

Surveys contemporary and developing political processes in the new, independent states of sub-Saharan Africa. This volume incorporates major trends of current research in African affairs.

March 1970, 400 pp., paper (36058-6) \$4.95
cloth (36059-4) \$7.95

THE SOVIET POLITICAL SYSTEM:

A Book of Readings

Richard A. Cornell, York University, Canada.

Readings to augment present knowledge and emphasize the present dynamic character of the Soviet political system. They uncover the forces both producing and resisting change within the Soviet Union.

June 1970, approx. 400 pp., paper (82382-3)
\$4.95 cloth (82383-1) \$7.95

EUROPE'S WOULD BE POLITY:

**Patterns of Change
in the European Community**

Leon N. Lindberg and Stuart A. Scheingold,
both of the University of Wisconsin.

An analysis of the progress made by the Common Market and the problems developed simultaneously since its inception in the early 1950's. Incorporates diverse and often competing theories.

April 1970, 256 pp., paper (29199-7) \$5.50
cloth (29206-0) \$6.95

**THE INTERNATIONAL
POLITICS OF REGIONS: A
Comparative Approach**

Louis J. Cantori, Jr., and Stephen L. Spiegel,
both of the University of California,
Los Angeles.

A framework for the comparison of international politics of diverse areas. Utilizes original and reprinted reading material. A detailed analysis of the five central world areas: Latin America, Western Europe, West Africa, Middle East and Southeast Asia.

April 1970, approx. 416 pp., cloth (47342-1)
\$7.95 paper (47341-3) \$4.95

**THE AMERICAN PARTY SYSTEM
AND THE AMERICAN PEOPLE,
2nd Ed., 1970**

Fred I. Greenstein, Wesleyan University.
Every chapter updated—some completely re-
written—to take account of political science
research since the first edition. Includes a
complete analysis of voting, local and national
politics, in-depth examination of pre-election
politics, through the 1968 elections. This edition
continues to provide a sharply focused intro-
duction to party politics at the voter, city,
state and federal government levels.
May 1970, approx. 128 pp., paper (02841-5)
\$1.95 cloth (02842-3) \$4.95

**THE CHALLENGE OF POLITICS:
Ideas and Issues, 3rd Ed., 1970**

Edited by Alvin Z. Rubinstein, University of
Pennsylvania and Garold W. Thumm,
Bates College.

40% of the material is new in this edition.
Most writers are contemporary rather than
classical, thus making discussions more relevant
to the student. Emphasis is on the American
scene with material by John F. Kennedy,
Nathan Glazer, the Kerner Commission, Martin
Luther King, Jr., and John Kenneth Galbraith.
March 1970, 448 pp., paper (12506-2) \$4.95

**THE GREAT ISSUES
OF POLITICS: An Introduction to
Political Science, 4th Ed., 1970**

Leslie Lipsón, University of California,
Berkeley.

A study of politics in terms of the fundamental
issues which form its constant core. This new
edition discusses the racial confrontation,
worldwide protests of submerged minorities,
the revolt of the young, and similar phenom-
ena which marked the history of the late
1960's. Shows with vivid perception the forces
which are now transforming our culture, and
the psychological aspects of contemporary
politics. April 1970, 480 pp., (36388-7) \$7.95

**READINGS ON STATE AND
LOCAL GOVERNMENT**

Edited by Irwin N. Gertzog, Yale University.
New articles and recent book excerpts analyz-
ing significant political relationships character-
izing American state and local governments.
Topics include intergovernmental relations,
political organization, legislative policy-making,
executive leadership, and judicial norm-en-
forcement. To encourage thought on basic
political concepts.
April 1970, approx. 120 pp., (76110-4) \$4.95

**AMERICAN AND SOVIET SOCIETY:
A Reader in Comparative Sociology
and Perception**

Edited by Paul Hollander, University of
Massachusetts, Amherst, and Harvard.
Unique writings by major sociologists in the
United States and the Soviet Union—focusing
on their major problems and institutions. The
works cover: Values, beliefs and ideologies;
Social stratification; Political institutions;
Family, marriage, sexual morality; Major
social problems; and the status of sociology in
two societies. 1969, 589 pp. (02399-4) \$8.95

THE GOVERNMENT OF THE UNITED STATES

P. ALLAN DIONISOPOULOS
Northern Illinois University

Students of American Government and Politics can better understand changes in governmental policies and current political phenomena if they have an understanding of the origins and evolutionary development of the United States. This completely new text, which uses a historic-structural-legal approach in describing the institutions, functions, and processes of governments within the United States, seeks to provide the familiarity needed to understand American political phenomena.

Unique in texts of this kind is Chapter Two, "The American Character", in which the author postulates on the viability of a constitution written nearly two centuries ago. The final chapter, "The American Political System: Perfect or Perfectible?", continues in this vein and is particularly apposite for today's questioning students. The subject of Civil Rights is covered in depth.

A teacher's manual containing explanatory material and suggestions for essay and examination questions is available.

672 pp. 1970 Cloth \$8.95

STUDENT'S WORKBOOK AND READINGS

CRAIG R. DUCAT
University of Minnesota

This workbook-reader is intended to accompany textbooks for the introductory course in American Government. Each of the eighteen chapters is divided into seven parts:

1. A glossary of the salient terms found in American Government texts.
2. Questions on the contents of these texts.
3. Objective questions to test knowledge of specific facts.
4. Thought questions on material related to the texts.
5. Readings directly related to the major topics.
6. Questions on the readings.
7. A short list of suggested readings.

The most significant contribution of this new book is the readings, listed below under the individual chapter headings. The editor has sought out the most pertinent and lively articles available.

Chapters parallel those in **THE GOVERNMENT OF THE UNITED STATES** by P. Allan Dionisopoulos. Used together, the two books provide material for a complete course. **A STUDENT'S WORKBOOK AND READINGS** may, however, be used with any text currently available.

THE DORSEY PRESS

Homewood, Illinois 60430

VRIJE UNIVERSITEIT TE AMSTERDAM

The Free University, Amsterdam, Netherlands, has a vacancy for a

senior lecturer in political science

Applicants for this function should be:

- graduates in one of the social sciences, preferably in political science,
- familiar with modern methods and techniques for social research and with various aspects of political analysis.

Educational and research tasks will be assigned at mutual agreement.

Since the Free University emanates from an evangelical though not church-bound protestant Society, it is kindly suggested that some information on personal orientation in this respect is added to the curriculum vitae.

Qualified applicants can address themselves to prof. dr. C. Kuypers, c/o Institute for Social Sciences, Koningslaan 22, Amsterdam, Netherlands. Equally welcome are suggestions with regard to names and persons who might be considered for appointment.

3 important new texts in COMPARATIVE POLITICS

from Bobbs-Merrill

just
published

EUROPEAN SOCIETY AND POLITICS by STANLEY ROTHMAN

March 1970

• 860 pp.

• clothbound, \$9.95

Stanley Rothman's masterwork is, in his words, "a series of interpretations . . . of the social and political life of four European nations." Beginning with a discussion of the forces which have shaped European history since the collapse of the Roman empire, Rothman explains how they have combined to direct the eventual courses taken by England, France, Germany, and the Soviet Union. He examines each nation from four points of view: the social and cultural bases of European politics in general, the development of political party systems, the varying processes of government, and attitudes toward public policy and its implementation. The final chapter is a far-sighted look into the future of European politics.

COMMUNIST PARTY-STATES *Comparative and International Studies* edited by JAN F. TRISKA

September 1969

• 427 pp.

• clothbound, \$9.00

"A truly pioneering effort to close the credibility gap between communist and other behavioral studies in the social sciences."

—PETER A. TOMA, *University of Arizona*

POLITICAL POWER IN THE SOVIET UNION: *A Study of Decision-Making in Leningrad* by PHILIP D. STEWART

October 1969

• 244 pp.

• paper \$3.95

• cloth \$7.50

"... a significant contribution to the on-going effort to wed Russian studies to empirical political sciences. It is also interesting as a case study showing what can be accomplished by exhaustively treating a carefully defined sector of Soviet politics. A very exciting venture."

—FREDERICK C. BARGHOORN, *Yale University*

American Politics and Government-

REGIONALISM IN AMERICAN POLITICS

by IRA SHARKANSKY

December 1969 • 212 pp. • clothbound, \$9.50

Unlike earlier studies of regionalism in politics, this book compares regions with one another from all sections of the country and assesses which of several regional groupings of states show the most uniform political traits. It also compares regional patterns of politics with regional patterns of economic development, examines changes in regional patterns between 1902 and 1962, and assesses regional patterns in a large number of indicators for voting behavior, party competition, legislative apportionment, and characteristics of state and local government.

CRISES IN FOREIGN POLICY

A Simulation Analysis

by CHARLES F. HERMANN

September 1969 • 246 pages • clothbound, \$8.50

"... represents a major effort in the application of man-computer simulation to the study of international politics. Using the Inter-Nation Simulation as a research tool, Professor Hermann succeeds in showing both the strength and limitations of man-computer simulation as an approach to learning about politics."

—WILLIAM D. COPLIN, *Syracuse University*

POLITICAL SCIENCE ANNUAL

Volume II, 1969-1970

edited by JAMES A. ROBINSON

February 1970 • 250 pp. • clothbound, \$7.50

This second volume offers concise, integrated appraisals of the extensive work in various subdivisions of political science from community power studies to international law, contributed by William Stephens and Stephen Long, Thomas R. Dye, James A. Robinson, William D. Coplin, and Chadwick F. Alger.

URBAN STUDIES

THE URBAN GOVERNORS: *Comparative Studies of Decision-Making by Small Legislative Groups in a Metropolitan Region*

HEINZ EULAU and KENNETH PREWITT, General Editors

Based on data collected by the City Council Research Project, Institute of Political Studies, Stanford University, The Urban Governors series will include 12 monographs linked not only to the literature on legislatures and rep-

resentation, but also to the literature on urban government, policy outputs, elections, interest group politics and other aspects of political life.

to be published

THE RECRUITMENT OF POLITICAL LEADERS:
A Study of Citizen-Politicians
by **KENNETH PREWITT**

Summer 1970 • 356 pp. • clothbound, \$8.50

A revealing study of how social class affects the processes through which leaders are selected, the relationship of political socialization and political recruitment, the degree to which those in positions of political power control who their successors will be, the kinds of experience and talents men bring to office, and the impact (or non-impact) of elections on how cities are actually governed.

THE THREADS OF PUBLIC POLICY:
A Study in Policy Leadership
by **ROBERT EYESTONE**

Summer 1970 • 160 pp. • clothbound, \$8.50

Drawn from interviews with 435 city councilmen in the suburban San Francisco area, this study examines the aspirations of the suburban citizens, their responses to metropolitan growth, and their successes and failures in maintaining the distinctive suburban life style in the face of metropolitan sprawl.

plus these previously published titles:

NEIGHBORHOOD GOVERNMENT:
The Local Foundations of Political Life
by **MILTON KOTLER**

July 1969 • 124 pp. • paper, \$2.95 • cloth, \$4.75

BRING THE POLITICAL SCENE INTO FOCUS WITH THESE NEW TITLES

ELEMENTS OF AMERICAN GOVERNMENT, 9th Edition

John H. Ferguson, The Pennsylvania State University; and **Dean E. McHenry**, University of Santa Cruz, California. 624 pages. Available April 1970.

The ninth edition of this fine work remains a comprehensive and reliable account of the structure, institutions, and functions of American Government at all levels (national, state, and local.) Thorough updating on currently important topics such as Vietnam, civil rights, selective service system reform, crime, and special problems of our growing metropolitan areas is the makeup of this book. Changing Federal-state-local relations are analyzed, and there is a discussion of principal foreign policy changes under the Nixon administration.

URBAN GOVERNMENT AND POLITICS

Carl A. McCandless, Washington University. 512 pages. Available March 1970.

Presented here is a study of city government—a part of the discipline of political science as it has been developing in recent years. Throughout the book, the reader is urged to understand politics as competition among groups seeking different ends in the political process. An effort is made not to describe what is good or bad about city government, but to analyze various kinds of laws and institutions in terms of how they affect political decisions.

ELEMENTARY POLITICAL ANALYSIS

Herbert Jacob, Northwestern University; and **Robert Weissberg**, Cornell University. 230 pages. Available April 1970.

Designed as a supplement for freshman American Government courses, this volume is essentially a workbook which provides the student with the basic tools of analysis (i.e., reading tables and graphs, reformulating problems) and then sets up political problems to give the student a chance to practice his analytic skills. He will be able to directly apply these methods to standard text material, lectures, and eventually to everyday life, and thus improve his ability to understand and evaluate political commentary.

THE AMERICAN POLITICAL PROCESS, 2nd Edition

Charles R. Adrian, University of California, Riverside; and **Charles Press**, Michigan State University. 768 pages, \$9.95 (1969)

A renewed dedication to crucial issues (i.e., politics of poverty and political participation) and to relevant empirical research with a distinct political action focus characterizes the revision of this important text. Its purpose is to provide an introduction to American Government that includes the best of both traditional and contemporary political science.

INTERNATIONAL POLITICS: Anarchy and Order in the World Society, 7th Edition

Frederick L. Schuman, Portland State College. 751 pages, \$9.95 (1969)

Here is a comprehensive, up-to-date survey of world affairs placed within a historical perspective. The material covers past state systems and the origin and nature of Western state systems; the elements of international law and international organization, the settlement of disputes, and the practice of diplomacy.

NEW FROM DODD, MEAD

POLITICAL SYSTEMS OF THE MIDDLE EAST IN THE TWENTIETH CENTURY

WASIF F. ABOUSHI, *University of Cincinnati* Cloth \$8.50

In a remarkably clear prose style, the book deals with 8 countries of the Middle East: Turkey, Egypt, Israel, Iraq, Jordan, Lebanon, Iran, and Syria. The author stresses historical background, constitutional developments, political parties, the power structure, foreign policy, and the economy in the treatment of each individual country. Special attention is given to the regional picture: regional pacts and alliances, inter-Arab feuds, the Arab-Israeli wars, the Yemeni war, the Cyprus problem, and Arab relations with the Western world. The author visited the Middle East four times while writing the book and was there immediately after the 1967 war between the Arabs and Israel.

SEARCH FOR PEACE: Readings in International Relations

Edited by DAVID BROOK, *Jersey City State College* Paper \$4.95

This new and unusual international relations reader has the unifying theme of the possibility of world peace. A wide range of sources, modern and classical, behaviorist and non-behaviorist, are drawn from to build the foundations of the book's thesis, which is developed through the presentation and examination of differing and often opposing concepts. The organization of the book easily lends itself to the organization of most international relations courses; its topics correspond to those normally covered. The readings themselves are of the highest caliber drawn from leaders in several disciplines. There is a lively, complete introduction before each topic grouping and before each individual selection.

THE URBAN POLITY

WILLIAM O. WINTER, *University of Colorado* Cloth \$8.95

"This newest textbook on urban government reflects current trends by introducing a greater comparative (cross-national) emphasis, a chapter on community power, and functional chapters on public safety, health, planning, housing, urban renewal, and the arts. The chapter on the arts is unique. This book also contains more historical depth than is usual in recent books. The style of writing is frequently very lively. After a plethora of readers, this volume ends a drought in municipal government texts of the survey variety."—From a review in *Public Administration Review*, Nov./Dec. 1969.

ELECTIONS IN AMERICA:

Control and Influence in Democratic Politics

GERALD M. POMPER, *Rutgers, The State University* Paper \$4.25

This book examines the true significance of our elections, including their effect on public policy, and demonstrates that, despite the common cynicism concerning the efficacy of the American ballot, the vote remains an important means to achieve popular demands. The book's ten chapters range in time from Plato's Greece to modern America and cover political philosophy, institutional analysis, voting behavior, electoral studies, party platforms, and the history of Negro suffrage. Many widely held beliefs are discussed and challenged.

WORLD POLITICS IN OUR TIME

David C. Jordan

A concise, interpretive study of 20th century world politics, this introductory text integrates theory, history and contemporary problems to give the student a broad background to international politics and encourage further speculation and research.

The book proposes a theoretical framework designed to help analyze any international system as a contemporary one; explores and evaluates the complexity of the present contemporary international system, including such substantive issues as the ABM debate and the tension spots between East and West and the Third World; and concludes with an evaluation of what we know about the international system and where we must go to manage transnational politics more safely.

1970 448 pages approx. Clothbound

READINGS ON THE AMERICAN POLITICAL SYSTEM

L. Earl Shaw and John C. Pierce

This collection of readings on the American political process is organized and unified within a systems analysis framework, with transitional introductory and explanatory notes at the beginning of each chapter. Attention is given to the "who" and "how" of decision making as well as to the contemporary substantive problems and issues which occasion decision, conflict, and cooperation within the American political system. Major features of the book are the number of readings devoted to a discussion of the most important issues in the American society, such as poverty, race, civil disobedience, crime in the street and the police; and the number of significant contributors.

1970 576 pages approx. Paperbound

THE POLITICS OF AMERICAN FEDERALISM

Studies in History and Politics

Daniel J. Elazar

Here is an outstanding addition to Heath's distinguished Studies in History and Politics Series. The text is a collection of representative readings on American Federalism, categorized into three basic groups: The American System: An Historical Theoretical Framework; Federalism in Action: Some Cases in Point; and Federalism Reconsidered: Problems and Prospects.

The selections view the interrelationship of levels of government, investigate its causes and briefly examine the relationship between federal theory and federal practice in the American system.

Labor in American Politics

by J. David Greenstone

"A scholarly . . . analysis of the emergence of organized labor as a major branch of the national Democratic party. . . . Greenstone brilliantly demonstrates that in helping the Democrats, labor goes beyond working-class or even specialized trade union concerns to promote consumer class interests." — *Book World*

"Excellent . . . This most perceptive study, based on first-rate original research, should be required reading for all those concerned with such critically important issues as: What is the political role of labor in a fully industrialized society? Is organized labor through as a significant agency for social change? How — under what circumstances — could a revitalized labor movement once again become the spearhead of social change?" — *Political Science Quarterly*

What Country Have I?

Political Writings by Black Americans

Edited by Herbert J. Storing, *University of Chicago*

A new text that endeavors to present a selection of those writings that explore most deeply and widely the American polity and the blacks' place within it—or outside of it. The selections have been chosen to represent what may be fairly described as the core of serious political thought of black Americans. The writers are men distinguished by their capacity to offer coherent, deep-rooted, and well thought out reasons for their positions; their writings invite the reader to join them in arguing, thinking, and reasoning about some of the important questions that men face—questions of justice, of power, of morality. The text includes a general introduction and brief introductions to each section, directing attention to the positions taken by each writer, to his thought and teaching, rather than to the historical circumstances in which he wrote. Suggested additional readings consist of other works of black political thought rather than of secondary sources, for it is the editor's belief that more will be gained by reading the original works themselves than by reading about them. Authors represented: Augustus Washington, Frederick Douglass, Booker T. Washington, W. E. B. Du Bois, James Weldon Johnson, Martin Luther King, Jr., Joseph H. Jackson, Malcolm X, Stokely Carmichael and Charles V. Hamilton, Eldridge Cleaver, Julius Lester, Albert B. Cleage, Jr., and James Baldwin.

256 pages cloth, \$6.50 paper, \$2.95

The New International Actors

The United Nations and the European Economic Community

Edited by Carol Ann Cosgrove, *Aberdeen College of Education* and
Kenneth J. Twitchett, *University of Aberdeen*

A collection of twelve of the best studies on the United Nations and the European Economic Community, reprinted here for the first time. This volume is one of the few to discuss the U.N. and the E.E.C. together, showing the extent to which they, as major international institutions, play significant roles in international affairs. The editors have contributed a comprehensive introduction that draws together much recent theoretical and factual material and sets out a series of tests designed to identify the qualities that allow international institutions to be actors in international affairs, having an impact that differs from, but can be as significant as, that of sovereign states. The text includes a selective bibliography emphasizing further reading on the major themes of the collection.

COMPARATIVE POLITICAL FINANCE: The Financing of Party Organizations and Elections Campaigns

Arnold J. Heidenheimer, Editor, with Herbert E. Alexander, Nils Andren, Christian Anglade, R. S. Milne and Khayyam Z. Paltiel, Michael Pinto-Duschinsky, and Uwe Schleth

This text is the first comparative compilation of studies about party finance processes and campaign techniques. It is not a highly specialized book, but rather attempts to measure as concretely as possible the reality of party life as a whole, both at election times and between election campaigns, through the means of studying political finance. It examines the choices which parties make and have to make throughout political life and analyzes modes of behavior and changes in this behavior. In depth it explores developments in the 1960s in representative countries of North and South America, Western Europe and Southeast Asia, and takes a new step toward using analyses of party finance to measure party activity in general.

MILITARY POWER AND POTENTIAL

Klaus Knorr

Over the past two decades, the components and conditions of military power and the environment in which it is exerted have undergone drastic change. This text is a completely new, comprehensive exploration of the subject from a contemporary perspective.

Concerned exclusively with the potential of states for *international* power, the book presents a clear exposition of the factors which determine the military potential of states, integrating political and administrative capabilities with economic and technological capacities.

CASTRO'S CUBA, FRENCH SOCIALISM,
AND INDONESIAN POLITICS

The Origins of Socialism in Cuba

By JAMES O'CONNOR. Certain to become controversial, this book contends that Cuban socialism developed organically out of the traditions and long-standing needs of the people. The author supports his thesis with a close examination of the Cuban economy before the revolution and of the steps Castro took to initiate socialism. Since reliable information on Cuba is scant, this thoroughly researched work will be indispensable for any observer of the Cuban revolution.

Indonesian Political Thinking, 1945-1965

Edited by HERBERT FEITH and LANCE CASTLES. This collection of more than one hundred speeches, pamphlets, and articles, most of them not previously available in English, will stand as the principal reference on Indonesian politics. Chosen to define and illuminate complex issues, the selections form a balanced, comprehensive survey of Indonesian politics from just before independence to the fall of Sukarno.

480 pages, appendixes, glossary, table.

\$13.50

French Socialists in Search of a Role, 1956-1967

By HARVEY G. SIMMONS. This is a study of the French Socialist party during the period when the government changed from a parliamentary system, in which the Socialists often had a share of power, to the de Gaulle system, in which the Socialist party is only an element of opposition. The author analyzes the tensions that arose as Socialist ideals conflicted with the day-to-day needs of the party organization.

Widely
Adopted

**POLITICAL ANALYSIS
& PUBLIC POLICY:
AN INTRODUCTION TO
POLITICAL SCIENCE**

Joyce M. Mitchell and William C. Mitchell
University of Oregon

Rarely in the history of textbooks has a volume captured the attention of the Mitchells' book. 3,000 requests were received in response to the first publication announcement alone. Such enthusiasm is understandable in view of these comments:

"This book is a distinctive contribution to political science . . . graceful in style, lucid in exposition, theoretically tight and empirically sound. The Mitchells treat the student to an exciting adventure into politics. If this book is widely employed in the introductory course, it will move undergraduate instruction to new and firmer ground."

Martin Landau
University of California, Berkeley

"A highly creative effort, effectively uniting imaginative conceptual developments with basic illustrative materials. The approach is stimulating, taking an informed and provocative perspective on traditional problems and combining this with non-technical examples of analytic reasoning."

William J. Crotty
Northwestern University

"The choice of theories of welfare economics previously found useful in analyzing political behavior is applied to political systems (national-international) in a form suitable for undergraduate instruction. An innovative and imaginative work with a mix of normative and analytical materials that should be quite suitable for the serious beginning student."

S. Sidney Ulmer
University of Kentucky

PEOPLE IN PUBLIC SERVICE:

A Reader in Public Personnel Administration

*Edited by Robert T. Golembiewski and Michael Cohen,
both of the University of Georgia*

The primary goal of this book is to view Public Personnel Administration as an interacting product of: 1. Broad conditioning environments; 2. Major managerial challenges; and 3. Controls. Within this orthodox framework the editors cover 10 major areas in public personnel administration and establish the interactions of these areas.

Jan. 1970 560 pages \$9.00

INTERNATIONAL SECURITY SYSTEMS:

Concepts and Models of World Order

Edited by Richard B. Gray, Florida State University

This book examines actual and theoretical models of international security systems. Each of the contributors to this volume examines processes, concepts, institutions and models, past, present, and future that have international security as the central purpose in the building of a stable system.

1969 227 pages \$4.25 paper

OPEN SYSTEMS:

Arenas for Political Action

By Henry S. Kariel, University of Hawaii

OPEN SYSTEMS is an exciting analysis of the problems of closure in contemporary society and American political science. Professor Kariel's argument is that politics at its best (not all politics) is a kind of play, of agnostic exertion, of free and self-delighting action.

1969 148 pages \$3.50 paper

COOPERATION AND CONFLICT:

Readings in American Federalism

Edited by Daniel J. Elazar, Temple University; R. Bruce Carroll, Hampshire College; E. Lester Levine and Douglas St. Angelo, Florida State University

The book's underlying premise is that federal principles and processes so permeate the American system of government that understanding of federalism is the key to the study of American government.

MASS POLITICS

Studies in Political Sociology

Edited by Erik Allardt, *University of Helsinki*, and
Stein Rokkan, *University of Bergen*

Twelve studies in comparative political sociology present theoretical ideas and empirical mass data about the social and institutional background of political cleavages, voter alignments, and party systems in advanced societies. The papers also analyze the geographical base of mass politics and political climates, and examine the processes by which cleavages and voting patterns have been translated to party systems.

BLACK POLITICAL PARTIES

A Historical and Political Analysis

By Hanes Walton, Jr., *Savannah State College*
Introduction by Samuel Cook

Here is an in-depth study of two types of black political parties in the United States: the separate party, independent of any other party, and the satellite or parallel party, dependent on a major party. The author examines such political groups as the Black Panther Party, the Negro Protective Party, and the Black and Tan Republican Party, and presents the first complete study of the Mississippi Freedom Democratic Party. In the light of the American political process, the author traces the history, purpose, scope, accomplishments, goals, and prospects of these and future parties.

AFRICAN POLITICS AND SOCIETY

Basic Issues and Problems of Government and Development

Edited by Irving Leonard Markovitz, *Queens College*

Focusing on the dynamics of societies in transition in black Africa, 27 selections discuss the difficulties in creating viable, stable, and progressive governments. They examine the distinct stages of development from precolonial greatness to postindependence bureaucracy: the struggle for formal independence, the consolidation of power, and the restructuring of society. Six articles translated from the French give important contemporary work in the social sciences not previously available to most students. An original introduction provides an overview and framework for the selection, and introductory comments to each section focus on the basic problem areas and significance of the individual readings.

Second Edition

By Herman Kahn

Foreword by Klaus Knorr

This volume studies the possibilities of total war and analyzes questions regarding warfare and survival. It retains the tone of the controversial "Kahn Briefings" and contains relevant data on national defense. "This book is most assuredly a landmark in the literature of military strategy and power-oriented diplomacy."—*The New York Times*

688 pages

A Free Press Paperback, \$3.95

THE AMERICAN POLITY

A Social and Cultural Interpretation

By William C. Mitchell

"The author deserves credit . . . for demonstrating that social science research is adaptable more or less to the stratospheric levels of Talcott Parsons' social theories. The chapters explaining the processes of 'integration', 'socialization', 'adaptation', and 'goal-attainment' will provide the reader with a more integrated view of the political system than is generally available elsewhere. There is in these sections a developed sense of how social institutions fit together. . . . Throughout, the reader gets a feel for the resiliency of social arrangements, for their toughness, and their longevity"—*Social Forces*

THE BEHAVIORAL REVOLUTION AND COMMUNIST STUDIES

Applications of Behaviorally-Oriented Political Research on the Soviet Union and Eastern Europe

Edited by Roger E. Kanet, *The University of Kansas*

Twelve studies on political developments in the Soviet Union and Eastern Europe employ theoretical approaches and research techniques in political science and related disciplines. The editor's introduction summarizes recent developments in political science and shows how these developments are influencing research on communist countries. Included are articles that use content analysis, correlation analysis, organization theory, and role theory.

LEADERS OF THE COMMUNIST WORLD

By Rodger Swearingen, *University of Southern California*

Thirty original biographical essays deal with contemporary world communist leaders. This volume offers insights into the communist world and shows the role and importance of such key figures as Mao Tse-tung, Dubcek, Castro, Kosygin, Brezhnev, Tito, in Piao, Chou En-lai, Kadar, Longo, Khrushchev, Gus Hall, and the late Ho Chi Minh. Illustrated with photographs, the essays concentrate on postwar strategists, leaders of parties currently in power, and key figures in non-communist countries.

SOCIAL DYNAMICS

By Kenneth E. Boulding, *University of Colorado*

Social Dynamics provides an overview of patterns of social change from an interdisciplinary perspective. Drawing on insights from biology, history, sociology, philosophy, and economics, this text is primarily concerned with the analysis of what major patterns can be discerned in the long term trends in society. The author presents a clear discussion of the shortcomings of the Marxist dialectical theory of social change.

MANAGEMENT OF THE URBAN CRISIS

Government and the Behavioral Sciences

Edited by Stanley E. Seashore, *University of Michigan*
and Robert J. McNeill, *The Pennsylvania State University*

Sixteen original contributions, from the fields of economics, psychology, sociology, and administrative science, present important behavioral science concepts and theories concerning managerial problems and processes in organizations and social and economic problems in urban life. The selections discuss decision-making, conflict resolution, and developmental methods and strategies for urban managers.

THE MEXICAN-AMERICAN PEOPLE

The Nation's Second Largest Minority

By Leo Grebler, *University of California at Los Angeles*,
Joan W. Moore, *University of California at Riverside*,
and Ralph C. Guzman, *California State College at Los Angeles*

The Mexican-American People is the most comprehensive study to date of the position in urban areas of the nation's second largest minority. Using an interdisciplinary approach, the authors present a view of the Mexican-American people both as a self-contained ethnic minority and as a part of the broader American populace. Original analytical essays examine these citizens from historical, socioeconomic, religious, political, and individual perspectives.

THE NATIONAL EXECUTIVE BRANCH

An Introduction

By James W. Davis, Jr., *Washington University*

This text describes the National Executive Branch and analyzes its role in the American political system. The author concentrates on the structure of the Executive Branch and the number and variety of organizations in it, and draws on studies in the sociology of formal organizations to bring a better understanding to the activities and conflicts in the Executive Branch.

A READER'S GUIDE TO THE SOCIAL SCIENCES

Revised Edition

Edited by Bert F. Hoselitz, *University of Chicago*

With Chapters by Peter M. Blau and Joan W. Moore, Heinz Eulau, Norton S. Ginsburg,
Gail Kelley, Walter R. Reitman, and Bert F. Hoselitz

Although many books and journal articles are cited in this study, this is not a bibliography. Each chapter refers to the more important "classics" in each field, and each contributor presents a description of the type of literary output and its uses in a field of specialization. This volume includes not only works incorporating substantive contributions, but also those discussing methodological questions. Each contributor has been free to add sections on popularized works in his fields and special items of interest in the literature of his specialty.

new in '70 FROM ALLYN AND BACON, INC.

1970! PERSPECTIVES ON URBAN POLITICS

Jay S. Goodman, Wheaton College.

Interdisciplinary in approach and coverage, this book of readings is designed for undergraduate courses in urban government, urban sociology, urban economics, and urban planning.

Features:

- the macro-micro approach to urban politics
- twenty-five articles written by leading scholars in political science, sociology, and economics
- comparative studies, theory and research, case studies
- introductions which open each part to set the material in context for the student

Jan. 1970, paperbound, 570 pp.

1970! ALLIANCE IN INTERNATIONAL POLITICS

Julian R. Friedman and **Christopher Bladen**, both of Syracuse University; and **Steven Rosen**, University of Pittsburgh.

Designed for international relations courses, this book focuses on the internal and external dynamics of alliances.

Features:

- illuminating perspective on the relative merits and limitations of traditional discursive analysis, systems analysis, game and utility theory, and historical quantitative methods
- timely discussions of current alliance policies
- a wide range of methodologies and orientations which offers an opportunity to compare approaches
- three previously unpublished articles by the editors
- introductions to each section which tie together the many facets of the volume

Jan. 1970, paperbound, 383 pp.

for your american government classes . . .

STATE AND LOCAL GOVERNMENT IN AMERICA, 2ND EDITION

Daniel R. Grant, Oauchita Baptist University; and **H. C. Nixon**. This highly successful Second Edition incorporates the latest research findings in legislative behavior, urban and metropolitan politics, community power structure, and intergovernmental relations, yet retains a balance of traditional approaches to the study of state and local government. "Metropolitics" and the problem of governing the metropolitan area receive special consideration and depth of treatment. 1968, 6½ x 9, 596 pp.

AMERICAN GOVERNMENT: Behavior and Controversy

Lewis Lipsitz, University of North Carolina. This outstanding volume contains selected readings taken from works of academic scholars and controversial spokesmen of various political positions. The major substantive and institutional areas of American government are presented with divergent viewpoints. Foreign policy, civil rights, and government regulations are dealt with in depth. 1967, paperbound, 678 pp.

POLITICAL BEHAVIOR OF THE AMERICAN ELECTORATE

William H. Flanigan, University of Minnesota. A comprehensive discussion of participation and partisanship in recent elections, this is the first book to draw on the four major national surveys of 1952, 1956, 1960, and 1964. Designed especially for introductory courses by presenting data which requires no background in statistics or political science, this text relates the changing patterns of turnout and partisan loyalty to social and economic factors. 1968, paperbound, 127 pp.

THE JUDICIARY: The Supreme Court in the Governmental Process, 2nd Ed.

Henry J. Abraham, University of Pennsylvania. The Second Edition is consistent with the timely approach, easily understood content, and well-written format of the previous edition in presenting a meaningful analysis of the judicial function as seen through the role of the Supreme Court. This new edition features the complete updating of all materials. 1969, paperbound, 128 pp.

for your political parties classes . . .

POLITICAL PARTIES AND POLITICAL BEHAVIOR

William J. Crotty, Northwestern University; **Donald M. Freeman**, University of West Florida; and **Douglas S. Gatlin**, Florida Atlantic University. Designed to bring to the student's awareness the diversity of materials relevant to the understanding of political parties, this is the first book of readings which focuses on empirical theory and behavioral research. Containing a comprehensive treatment of major and minor parties in American history with emphasis on their evolutionary nature, each chapter is preceded by an introduction which unifies the specific pieces and integrates these into the overall framework of the book. 1966, paperbound, 630 pp.

PRACTICAL POLITICS IN THE UNITED STATES

Cornelius P. Cotter, The University of Wisconsin at Milwaukee. The collection of original essays written for this book introduces the student to the history and theory of parties at the national level and describes the organizational framework and dynamics of running for public office at all levels. 1969, paperbound, 351 pp.

other outstanding books . . .

REFORM AND REVOLUTION: Readings in Latin American Politics

Arpad von Lazar, Fletcher School of Law and Diplomacy, Tufts University; and **Robert Kaufman**, Rutgers University. This timely anthology focuses upon the reformist and revolutionary approaches to the political, economic, and social issues confronting Latin America in her developmental steps toward modernization. 1969, paperbound, 357 pp.

WORLD POLITICS: The Writings of Theorists and Practitioners, Classical and Modern

Arend Lijphart, University of Leiden, The Netherlands. This collection of readings by outstanding classic and contemporary political theorists and practitioners consists of provocative articles, chapters and speeches presenting different interpretations of controversial issues. 1966, paperbound, 448 pp.

EUROPEAN POLITICAL PROCESSES: Essays and Readings

Harry S. Albinski, The Pennsylvania State University; and **Lawrence K. Pettit**, Montana State University. Relating general political phenomena to particular political systems, this book of scholarly readings and original essays presented in their entirety offers a functional approach to topics of concern in Great Britain, Germany, France, and the Soviet Union. 1968, paperbound, 444 pp.

Involve your secondary classes in learning with **SIMULATION GAMES**

Simulations are games that abstract features of a society and present them in a game context. Players learn through *active participation*; in order to play, they have to make decisions; to act; and to "live out" the consequences of their actions.

CONSUMER

Buying goods "on time" and through loans helps players (consumers and credit agents) understand consumer credit—its mechanics, its advantages, and its pitfalls. Author: Gerald Zaltman, Ph.D.

LIFE CAREER

Players make life-decisions for a fictional teenager in three basic areas: work, school, and marriage. They work out the long range consequences of the decisions, and become aware of the critical importance and possible effects of their *own* decisions in the same areas.

GENERATION GAP

A parent player and a teenager player confront one another over conflicting issues. Players gain insight into the family structure and its power relationships, and learn that conflicts can best be resolved through communication and compromise. Authors: Erling O. Schild, Ph. D., and Sarane S. Boocock, Ph. D.

ECONOMIC SYSTEM

Players become workers, farmers and manufacturers: As they produce, market, and consume goods, they gain insight into the dynamics of a wide variety of economic systems. Authors: T. Robert Harris, B.A., and James S. Coleman, Ph. D.

DEMOCRACY

As members of a legislature, players come to understand how laws are made in a representative democracy. They appreciate the factors that shape a legislator's votes, and learn why legislative decision-making is often a complicated process. Author: James S. Coleman, Ph. D.

GHETTO

As a player becomes involved in trying to improve the life situation of a person living in the ghetto, he realizes how poor work, school and living conditions can perpetuate themselves, breed frustration and anger, and sometimes can inspire heroic community action. Author: Dove Toll, M. R. E.

COMMUNITY DISASTER

A person whose community is struck by a disaster is faced with a dilemma: responsibility for the safety of his family versus the need to help the community overcome the disaster. The game demands that players think clearly to maximize their effectiveness in times of stress. Author: Michael Inbar, Ph. D.

These simulations were developed by Academic Games Associates, a non-profit organization devoted to the development and testing of games for learning. Academic Games Associates originated at The Johns Hopkins University, and is under the direction of Dr. James S. Coleman.

NATION-BUILDING AND CITIZENSHIP

Studies of Our Changing Social Order

Reinhard Bendix. Recent developments in Russia, India, and Japan are viewed in the light of the European experience of the 18th and 19th centuries. "An important book in which one of the most interesting of contemporary sociologists makes a highly individual contribution to the comparative study of development or, more broadly, of social change."—*T. H. Marshall.* \$1.75

MARX AND THE INTELLECTUALS

A Set of Post-Ideological Essays

Lewis S. Feuer. This collection brings together for the first time some of the author's best known studies on the emergence of neo-Marxism in the past decade. Their common theme is the "alienation" of American intellectuals and how it has drawn them to a neo-primitivist Marxism. *An Anchor Original.* \$1.45

THE FUTURE OF CONSERVATISM

Revised Edition

M. Stanton Evans. Dealing with the political possibilities of conservatism, rather than its ideology, Evans analyzes the events and issues that he feels will be important in future elections. This revised edition also includes a detailed, penetrating summary of the 1968 election year. \$1.45

THE PRESIDENTS' MEN

White House Assistants of Franklin D. Roosevelt, Harry S. Truman, Dwight D. Eisenhower, John F. Kennedy and Lyndon B. Johnson.

Patrick Anderson. This examination of an unofficial, but vital, power structure in Washington has been termed "a timely contribution to . . . better understanding of that bureaucratic Byzantium which underlies every President."—*New York Magazine* \$1.95

SELECTED WRITINGS OF P.-J. PROUDHON

Edited by Stewart Edwards; translated by Elizabeth Fraser. This is the first selection in English of the work of the volatile 19th-century French writer (1809-65) whom Paul Goodman called a "founding father of anarchism." *An Anchor Original.* \$1.45

Recent publications . . .

BASIC ISSUES OF AMERICAN DEMOCRACY

Sixth Edition

Edited by HILLMAN M. BISHOP and SAMUEL HENDEL, both of The City College of The City University of New York. Over 90,000 copies of the Fifth Edition in use. Employing the broad spectrum of diverse viewpoints so popular in the fifth edition, this completely up-to-date edition deals with the most vital, critical, and compelling issues of our day. Among the new selections are pieces by Stokely Carmichael, Charles V. Hamilton, Bayard Rustin, Donald Stokes, Warren E. Miller, Robert A. Dahl, Edward M. Kennedy, James Q. Wilson, and the National Advisory Commission on Civil Disorders. 624 pp., paper, \$4.95 (tent.)

SMOKING AND POLITICS

Policymaking and the Federal Bureaucracy

A. LEE FRITSCHLER, *The American University*. "What are the facts about smoking? . . . Who's protecting the public? . . . How can there be such a blatant disregard for the public welfare? *SMOKING AND POLITICS* . . . by A. Lee Fritschler tells the story of the fight for and against the regulation of cigarette advertising. But he does more. He analyses the relationship between the Congress, the regulatory agencies and the 'interests'. Don't miss this fascinating study of the way our government works."—from *The Nation*, November 24, 1969. 165 pp., paper, \$1.95

THE HONEST POLITICIAN'S GUIDE TO CRIME CONTROL

Norval Morris *and* Gordon Hawkins

"We have a cure for crime," is the bold claim of a book which *Publisher's Weekly* hails as "a brilliant analysis of law and order in the U.S." With refreshing wit, insight, and candor, the authors criticize our criminal justice system as "a moral busybody" and attempt to clarify the proper function of law enforcement. They systematically present a program which covers the amount, costs, causes, and victims of crime, and the problems of crime control. Precise recommendations are given and carefully defended. Comments from professionals include Carl Menninger's statement; "If my book, *The Crime of Punishment*, persuaded anyone that something could be done to improve our control of criminal behavior, let him now read this eloquent and intelligent prescription of exactly what to do."

1970 LC:76-101467 304 pages \$5.95

THE LIVES OF WILLIAM BENTON

Sidney Hyman

William Benton's biography is a portrait of a creative public man, and the reflection of an era. An advertising genius, an innovator in education, a publishing giant, and a deeply committed statesman in rational government, in his life Benton has put his distinctive mark upon nearly every sphere of twentieth-century America. As a political figure—senator, assistant secretary of state, ambassador to UNESCO—Benton was close to the center of the most significant events of his time. Most dramatic was his courageous fight against Senator Joseph McCarthy. Sidney Hyman has had the rare luxury of full access to Benton's personal and business correspondence. What emerges from his biography is a lively portrait of a unique man of our time.

1970 LC:72-88231 688 pages \$10.00

POINT OF VIEW

Talks on Education

Edward H. Levi

"It is sometimes said that society will achieve the kind of education it deserves. Heaven help us if this is so," remarks Edward Levi in one of the lectures published here. Levi has served the University of Chicago for most of his professional life, as professor and then dean of its law school and as provost and president of the university. These talks were given between 1963 and 1969 to various audiences of greater or lesser formality. They embody a basic approach to higher education—illuminating problems, choices, and directions. Throughout these talks, the reader will find expressions of Levi's essential belief that "the university must stand for reason and for persuasion by reason."

THE GATT

Law and International Economic Organization

Kenneth W. Dam

A case study in international organization, this book offers a legal analysis with economic and political implications. The subject of the study is the General Agreement on Tariffs and Trade, or the "GATT." Dealing day by day with the problems of international trade in their many dimensions, the GATT has become the principal international trade institution of the postwar world. The author is interested in the role of rules in international life—particularly procedural rules that can be used to influence sovereign nations. He argues that only when law is understood not as a set of prohibitions but as a set of procedures to be used in reaching agreements and accommodations can it become an effective force in world affairs.

1970 LC:75-93088 544 pages \$15.00

SAINTS OF THE ATLAS

Ernest Gellner

This is a study both in political and religious sociology. Among the central Moroccan Berbers a kind of state developed in which the rulers, hereditary holy men, were obligatorily peaceful while their subjects, ordinary tribesmen, were addicted to feuds and compelled to seek redress either in private violence or in supernaturally sanctioned oaths—a legal decision procedure used to determine the truth of an accusation. The hereditary saints provided the framework of order and continuity. In his quest for an explanation of the origin and functioning of this political organization, Gellner illuminates general issues concerning the place of religion in tribal life, the interdependence of political and religious institutions, and the role of tribes both in traditional civilizations and in developing societies. *Nature of Human Society* series, Julian Pitt-Rivers and Ernest Gellner, General Editors.

1970 LC:78-89515 Illustrated 317 pages \$9.50

CHICAGO

TRIESTE 1941-1954

The Ethnic, Political, and Ideological Struggle

Bogdan C. Novak

With an Introduction by William H. McNeill

The Italian-Yugoslav border dispute over Trieste brought the world to the brink of war as the Western powers and the Soviet Union fenced for position in Europe. In the strategically sensitive Julian Region, Croat and Slovenian nationalisms collided with Italian nationalism, at the same time chaffing against the Yugoslav harness. The struggle raged from 1941 until 1947, when the Paris peace conference divided the area into three parts. A small eastern part went to Italy, the larger eastern part went to Yugoslavia, and the city of Trieste, with its immediate hinterland, became a new state under the protection of the United Nations. This new state, the Free Territory of Trieste, became a microcosm of the nationalistic struggle. Novak describes how ethnic conflict and the clash of Western and Eastern ideologies influenced the political activities and the lives of the people living in the Trieste region.

edited by W. Raymond Duncan, State University of New York at Brockport

Soviet Policy in Developing Countries

A reader for specialists and nonspecialists concerned with Soviet foreign policy and the international politics of Africa, the Middle East, Asia, and Latin America. In essays written, for the most part, expressly for this book, the evolution of Soviet policy toward the third world, its influence, limitations, and involvement in crisis areas are here examined by experts. Paperbound. In press.

edited by John L. Shover, University of Pennsylvania

Politics of the Nineteen Twenties

Primary source material essential to the student of modern American politics. The collection focuses on the key political issues of the decade (relief for the American farmer, immigration policy, Muscle Shoals, and the Mellon Tax Plan), the electoral behavior of the Harding years, and the presidential elections. Paperbound. Now available.

by Andrew Gyorgy, George Washington University, and George Blackwood

Ideologies in World Affairs

The historical background and present status of today's major isms, with an analysis of the roles they play in developing nations. Paperbound. \$3.75

NEW FROM HORIZON PRESS

Three Brilliant Books of Basic Concern

Britain's Future
DAVID P. CALLEO

"... a brilliant book, very likely the clearest and most convincing analysis of British policy since the war."

—*The New York Times*

"Indeed, anyone who seeks information and guidance on current political, economic, and monetary problems in Europe would do well to read *Britain's Future*."

—*The Saturday Review*

"... brilliant inquiry ... by an American political scientist who fully understands the importance and nature of British cultural traditions. A broadly gauged, elegant and timely work."

—*Foreign Affairs*

Voice of Israel
ABBA EBAN

\$6.50

A new enlarged edition of the eloquent chronicle of a nation from birth to maturity—by one of the foremost statesmen of our era who has been his country's voice at the tribunals of world opinion since the establishment of the State. Mr. Eban presents an unequalled picture of the young country in the two decades of its freedom. The book contains all of his major addresses, and conveys the sense of high moment.

\$6.95

Memoirs of a Revolutionist
PETER KROPOTKIN

This is the only available complete original edition of the majestic autobiography which George Brandes called, "One of the cornerstones for the building of the future." Prince Kropotkin was one of the most significant figures in the political ferment in Russia and Europe until his death in 1921, and his *Memoirs* is considered among the most important and definitive records of that period ever published. "An incomparable record."—*Time*. New introductions by Paul Goodman and Barnett Newman.

New, Third Edition

THE ASIANS: *Their Heritage and their Destiny*

Paul Thomas Welty, *Northeastern State College*

■ This brief introduction to contemporary Asia has been adopted for a wide variety of courses. The author probes historical backgrounds, political and social institutions, religions, economic systems, and analyzes tensions stemming from conflicts between traditional and Western ideologies. The Third Edition brings the book completely up to date with the incorporation of new material on recent developments: the Cultural Revolution in Communist China, Japan's continuing economic and industrial growth, recent events in North and South Korea, the Vietnamese peace talks in Paris, and President Nixon's remarks on U.S. objectives and intentions in Vietnam.

January 1970

POLITICS and the INTERNATIONAL SYSTEM

Edited by Robert L. Pfaltzgraff, Jr., *University of Pennsylvania*

■ This well balanced collection brings together selections from some of the most important writings on the nature and scope of international relations as a discipline, and on the study of international phenomena. The selections, many representing diverse and conflicting viewpoints, are arranged within nine major sections: International Relations as a Discipline, The Nature of the International System, Conflict and Military Potential, Technology and International Politics, Economics and the International System, Man-Milieu Relationships, National Character and Transnational Images, Propaganda and Psychological Warfare, and The Management of Power.

American Government and Political Change

Edited by WILLIAM R. NELSON, Memphis State University. Organized around the central theme of political change, this collection of readings explores the problems faced by American political institutions in their attempt to meet new demands. Emphasizing topics of vital concern and relevance, the thirty-seven selections offer interpretive commentaries on the American process, its concepts, traditions, and potential. Substantial portions of the Walker, Moynihan, and Kerner reports are included, as well as other materials of an equally provocative nature.

Power and Poverty:

THEORY AND PRACTICE

By PETER BACHRACH, Temple University, and MORTON S. BARATZ, Boston University. A significant contribution to the field of community power studies, this book presents a new approach to the analysis of power and the correlates of power: authority, influence, and force. Part I consists of a theoretical analysis of the political process, with particular reference to the concept of nondecision-making, culminating in a presentation of a model of the political system. Part II applies the theoretical model to the relationship between the antipoverty effort and the political process in Baltimore, Maryland.

Readings in World Politics

SECOND EDITION

Edited by ROBERT A. GOLDWIN, *St. John's College*, and TONY PEARCE, *Friends World College*. A provocative book of political argument, the Second Edition has been revised to reflect a more balanced world perspective. In this revision, the reader is invited to participate in the global dialogue between the United States, the Soviet Union, and the People's Republic of China. Included in the sixty-three readings are excerpts from European, Japanese, and Indian writers.

German Foreign Policy in Transition

BONN BETWEEN EAST AND WEST

By KARL KAISER, *Johns Hopkins University Center at Bologna*. The coalition of Germany's Christian Democrats and Social Democrats has led to major changes in Bonn's foreign policy—and West Germany is now engaged in a searching debate about her dealings with her Eastern neighbors, the place of Germany in a divided Europe, and the future of the Western Alliance. This expert and up-to-date guide to the debate pays particular attention to the interaction between domestic and international politics in the political systems of Bonn and East Berlin. (*Royal Institute of International Affairs; Oxford Paperback, 159.*)
paper, \$1.95

The Administrative History of India, 1834-1947

By B. B. MISRA. This work presents in broad perspective the growth in India of modern political and administrative institutions. It is based on a study of primary sources, including the private papers of the Viceroy and Secretaries of State for India. The period covered begins in 1834, when the East India Company's trading rights were abolished, and ends in 1947, when India achieved independence. \$19.00

The British Yearbook of International Law, 1967, Volume 42

Edited by SIR HUMPHREY WALDOCK, *Oxford University*; and R. Y. JENNINGS, *Cambridge University*. This yearbook contains commentary on significant events and recent work in international law. Among the articles in the book are: State Contracts and International Arbitration and International Corporations and National Law; the 1967 Protocol Relating to the Statue of Refugees; The Justifiability of Disputes and Issues in International Relations; Crimes Committed on Board Aircraft; and the Other Space Treaty. (*Royal Institute of International Affairs.*) \$14.00

The Constitution of India

ITS PHILOSOPHY AND BASIC POSTULATES

By P. B. GAJENDRAGADKAR, *University of Bombay*. This volume is the first in a series of annual lectures to be given at University College, Nairobi, as a tribute to Mahatma Gandhi on the anniversary of his birth. The author demonstrates in this volume how Gandhi's vision has been embodied and made practicable in India's constitution, and how this constitution is a living organ able to accommodate the multifarious aspects of Indian life. (*Gandhi Memorial Lectures.*)

New from Wadsworth:

THE IRONY OF DEMOCRACY: An Uncommon Introduction to American Politics

by Thomas R. Dye, Florida State University, and
L. Harmon Zeigler, Jr., University of Oregon

This penetrating and often iconoclastic book is a reinterpretation of American politics from the viewpoint of elite theory. Designed as a text for American politics courses, it offers fresh insight into the questions today's students are asking. While covering the same general topics—constitution, elections, courts, civil rights, etc.—as other basic texts, this book approaches them in a new and non-standard way. March 1970. About 400 pages. 6 x 9. Clothbound. Instructor's Manual with Test Items.

AMERICAN GOVERNMENT: Theory, Structure, and Process

by Thomas R. Dye, Florida State University, Lee S. Greene, University of Tennessee, and
George S. Parthemos, University of Georgia

This introductory text weaves the various approaches to government—theoretical, structural, and behavioral—into a concise and balanced volume. 418 pages. 7¼ x 9½. Clothbound. Instructor's Manual.

Also new for 1970:

ISSUES OF THE SEVENTIES

edited by Leonard Freedman, University of California, Los Angeles. March 1970.
About 450 pages. 6 x 9. Paperbound.

TECHNIQUES OF POLITICAL ANALYSIS: An Introduction

by Lyman T. Sargent and Thomas A. Zant, University of Missouri, St. Louis.
1970. About 200 pages. 8½ x 11. Spiralbound.

IDEOLOGY, POLITICS, AND POLITICAL THEORY

by Richard H. Cox, State University of New York, Buffalo. 356 pages. 6 x 9. Paperbound.

THE CONGRESSIONAL SYSTEM: Notes and Readings

edited by Leroy N. Rieselbach, Indiana University. February 1970. About 450 pages. 6 x 9.
Paperbound.

PUBLIC OPINION, 2nd Edition

by Bernard C. Hennessey, Pennsylvania State University. March 1970. About 400 pages.
6 x 9. Clothbound.

POLITICAL OPINION AND ELECTORAL BEHAVIOR: Essays and Studies, 2nd Edition

edited by Edward C. Dreyer, University of Missouri, St. Louis, and Walter A. Rosenbaum, University
of Florida. 1970.

AUTHORS WANTED TO WRITE ONE OR MORE CHAPTERS FOR A NEW AMERICAN GOVERNMENT TEXTBOOK (INTRODUCTORY LEVEL) FOR SENIOR AND JR. COLLEGES

OBJECT IS TO MAKE THIS TEXT AVANT-GARDE AND RELEVANT TO THE NEEDS OF TODAY'S COLLEGE POPULATION.

CONSULTING EDITORS ALSO NEEDED TO READ AND EDIT CHAPTERS.

On a fee basis. We are eager to contact *specialists* in their field who can either *write, revise* or *edit* chapters of this text. We are looking for college professors and instructors with a solid writing ability.

Some of the new chapters needed are:

1. **SOCIAL ATTITUDES TOWARD THE GOVERNMENT AND LAW.** The Problems of "Leadership." "Are We All Policemen?" etc. Scapegoating of political leaders; the Problem of the Family. Are leaders "out-of-touch"?
2. **THE DISINTEGRATION OF THE CITIES.**
3. **THE MYTH OF THE MELTING POT.**—Inter-group tensions. *Human Zoo* concepts and other scientific theories applicable to human behavior.
4. **The DANGER OF OVER-POPULATION**
5. **ENVIRONMENT, ECOLOGY AND POLLUTION**
6. **THE "DRUG CRISIS" IN AMERICA AND THE WORLD & the "White Death"** (The Heroin Epidemic)
7. **CRIME AND VIOLENCE.**
8. **SAFETY IN YOUR STREET,** your home, business and school.
9. **"HIPPIECULTURE,"** the **"BLACK POWER MOVEMENT"** and the **"SEXUAL REVOLUTION"** (myth and fact) examined.
10. **THE VIETNAM WAR—"Finding a Honorable Peace in a Dishonorable War."**
11. **PEACE & WAR.** Psychological, sociological and scientific theories to explain war and peace. Hopes for the Future of Mankind. The Military Industrial Complex; "Game Behavior" of people, groups and nations.
12. **REVOLUTION, "REBELLION" and the PERSONALITY, AND THE PROBLEM OF THE "FAMILY"**
13. **RELIGION**
14. **SOCIAL CHANGE.** The Problem of self-defeating behavior. Do you Change and/or does the World Change? Where is the "Happy Age"?
15. **THE GROWTH OF PSYCHOLOGY AND SOCIOLOGY AND ITS INFLUENCE UPON GOVERNMENT.** Psychological theories and methods.
16. **THE COMMUNICATION GAP—The Media—Newspapers, Radio, Television, Magazines, records, talking, etc.**
17. **EDUCATION—Chaos in our Schools. The "Blackboard Jungle."**
18. **LIFE AND DEATH—Medicine, Health & Physical Fitness.**
19. **SUMMARY OF MAJOR SCHOLARLY AND POPULAR BOOKS, ARTICLES AND OTHER MEDIA ON AMERICAN GOVERNMENT.** Ideas of the major political thinkers.
20. **GUIDE TO ADVANCED STUDY, CAREERS AND GRADUATE SCHOOLS IN AMERICAN GOVERNMENT.**
21. **HOW TO WRITE RESEARCH PAPERS IN AMERICAN GOVERNMENT.**

We also need artists and researchers for this text. If you are interested in the above kindly contact: Social Studies Editor, COLLEGE NOTES & TEXTS, INC. 184 Fifth Avenue, New York City, N.Y. 10010 or call 212-MU 3-8800.

Kindly send *Vita* or *resume* and proposed chapter outline. Chapters should be moderately foot-noted with a short annotated bibliography after each chapter (about 25-30 books and articles) and should include pictures, diagrams, charts, etc. where necessary. Each chapter should be approx. 10,000 wds. including 1000 wds. of exam type questions and answers. Chapters are due on May 1, 1970 or earlier. Text to be published summer of 1970. **FEE SCALE** as follows:

New Chapters	\$250 each
To Revise a Chapter	\$100 each
Editing and Consulting per Chapter	\$ 25 each

American City Planning

Mel Scott

Mr. Scott describes the political events, the persons, the institutions, the legislation which comprise the story of American planning since 1890. The book is remarkably comprehensive and includes a wealth of detail gleaned from hundreds of original documents and extensive interviews with pioneers of the profession.

California Studies in Urbanization and Environmental Design

1969 LC: 70-84533 768 pages illustrations \$17.50

The Unwelcome Immigrant*The American Image of the Chinese, 1785-1882*

Stuart Creighton Miller

The American decision in 1882 to exclude Chinese immigrants represented the first institutional break with the traditional melting-pot concept. In seeking an explanation for the event, Mr. Miller finds that an unfavorable reputation preceded the Chinese to the United States and that, despite current beliefs to the contrary, sino-phobia was endemic in the eastern states long before the admission of California to the Union.

1969 LC: 76-81763 300 pages \$6.95

The Political Economy of Change

Warren F. Ilchman and Norman Thomas Uphoff

In this attempt to provide a social science superior to present political science and more relevant than economics for the task of analyzing public policy, especially in relation to developing countries, the authors explore the functions and characteristics of political resources; political exchange, and political productivity. This perspective permits them to compare the efficiency of various public policies and to estimate their costs.

1969 LC: 71-81743 384 pages \$8.50

Politics and Government in Turkey

C. H. Dodd

The only comprehensive study of politics and administration in modern Turkey, this work examines in detail the nature and effects of the extensive reforms started after the revolution of 1960. Mr. Dodd first describes the Ottoman legacy to modern Turkey and the peculiar problems of the Turkish Republic between 1923 and 1960. Special attention is paid to the innovations made by the military in the Turkish administrative system.

1969 LC: 78-85453 335 pages \$7.95

The Quest for Regional Cooperation*A Study of the New York Metropolitan Regional Council*

Joan B. Aron

Voluntary, nonpartisan, without sovereignty over an inch of territory, the New York Metropolitan Regional Council is potentially one of the nation's most important regional planning organizations. It was founded in 1956 by officials from New York, New Jersey, and Connecticut to undertake regional solutions to such problems as transportation, traffic control, water supply, air and water pollution, recreation, law enforcement, and housing.

YOU MEAN I CAN GET **\$50,000** OF TIAA LIFE INSURANCE FOR LESS THAN **\$100?**

That's what an Assistant Professor asked us when he heard about TIAA's low life insurance costs.

It's true. At his age 30 the annual premium for a 20-Year Home Protection policy providing \$50,000 initial amount of insurance is \$159.00. The first-year dividend, based on our current dividend scale, is \$61.00, making a net payment of \$98.00. Dividends, of course, are not guaranteed.

The Home Protection plan is level premium Term insurance providing its largest amount of protection initially, reducing by schedule each year to recognize decreasing insurance needs. This is just one example of the many low-cost TIAA plans available. If you need more protection for your family, ask us to mail you a personal illustration with figures for a policy issued at your age. We'll also send the Life Insurance Guide describing other TIAA policies.

ELIGIBILITY

Eligibility to apply for this or other TIAA life insurance is limited to persons employed at the time of application by a college, university, private school, or other nonprofit educational or scientific institution that qualifies for TIAA eligibility.

Geneva 1954

The Settlement of the Indochinese War

ROBERT RANDLE

"... by far the most detailed and comprehensive analysis of Geneva 1954 to date." (John Norton Moore). Dr. Randle assesses the Eisenhower-Dulles policies in the critical months leading up to the conference, the effects of the antipathy between Foster Dulles and Anthony Eden, Mendès-France's policies in Indochina and Europe, and the day-by-day bargaining over political issues at Geneva. \$17.50

Vietnam and China, 1938-1954

KING C. CHEN

Why and how did the United States get involved in Vietnam? This is one of the central questions in Professor Chen's book, which describes Ho Chi Minh's rise to leadership of the Vietnamese Communist Party and his relations with the Nationalists and then the Communists in China. He explores in detail the Sino-Vietnamese relationship after World War II. \$12.50

The Status of Law in International Society

RICHARD A. FALK

Following the pattern established in his book, *Legal Order in a Violent World*, Professor Falk brings the outlook, methods, and concerns of the social scientist to the study of international law. Among the topics he covers are Indonesia's "confrontation" with Malaysia; the South West Africa decisions; the law-making capacity of the General Assembly; and the application of international law to domestic courts.

Government Reform

Four Subject Sets in the Irish University Press 1,000-Volume Series of the British Parliamentary Papers

Great Britain's unprecedented reform of government in the nineteenth century resulted from intensive self-scrutiny and criticism, much of which emanated from the investigations of the British Parliament. The main thrust of the Parliamentary studies was directed against the patronage system, inefficient communications, and ineffective organization.

In a major project of information retrieval Irish University Press editors have drawn together the rich documentation and source material on government scattered throughout the 7,000 volumes of the British Parliamentary Papers published during the nineteenth century and organized them into four subject sets: *Diplomatic Service* (4 volumes), *Civil Service* (12 volumes), *Elections* (5 volumes), and *Municipal Corporations* (9 volumes), plus a vitally important 15-volume related subject set, *Military and Naval*.

These volumes richly detail a century of reform. The *Diplomatic Service* set witnesses to the significant changes in British diplomatic and consular service as it became a formidable international force. It was responsible for setting up the gigantic and complex network which handled British trade and played an even more vital role in the maintenance of the nineteenth century peace. The *Municipal Corporations* set contains the documentary basis for the intensive movement of reform in local government, including the systems of taxation, poor relief, police, the administration of justice, transportation, sanitation, etc. The *Civil Service* subject set provides a wealth of information on the growth of the British civil service into a highly effective organization.

The four subject sets on *Government* plus the *Military and Naval* volumes are 5 of the 79 subject sets in the Irish University Press Series of the British Parliamentary Papers. Each subject set is available to school, public, and professional libraries individually or as part of the entire Series.

The publication by the Irish University Press of the British Parliamentary Papers is obviously an act of first-rate importance for all modern historians. With the belated development of comparative history, it becomes all the more important for historians of one nation to have easy access to basic source materials on social change in another nation; so even American historians, like myself, will find the British Parliamentary Papers of inestimable value.

Arthur Schlesinger, Jr.

EXECUTIVE OFFICE

Executive Director, APSA
1527 New Hampshire Ave., N.W.
Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE REVIEW, published quarterly during the months of March, June, September, and December, is supplied to all APSA members. Individual and institutional memberships are \$15.00 a year (\$6.00 for graduate and undergraduate students; five-year limitation). Foreign currency at the official exchange rate will be accepted for foreign subscriptions and foreign membership fees. The equivalent of \$1 for additional postage should be added for foreign subscriptions.

Current issues are priced at \$3.75 per copy; for *back issues* prior to 1963 address Johnson Reprint Corp., 111 5th Ave., New York, N.Y. 10003; subsequent to 1963 send request directly to the American Political Science Association.

Applications for membership, orders for the REVIEW, and remittances should be addressed to the Executive Director, The American Political Science Association, 1527 New Hampshire Ave., N.W., Washington, D.C. 20036. *Notices of change of address* should be received in the Washington office by the 25th day of the month before publication.

Address correspondence about contributions to the REVIEW to Austin Ranney, North Hall, University of Wisconsin, Madison, Wis. 53706. All manuscripts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

Address books intended for review to Richard F. Fenno, 575 Mount Hope Avenue, Rochester, New York 14620; information, including News and Notes, for the Association's newsletter *P. S.*, should be sent to 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036; advertising, reprint and circulation correspondence to the Executive Director at the Washington office.

Articles and notes appearing in the *Review* before the June, 1953 issue were indexed in *The Reader's Guide to Periodical Literature*. *The International Political Science Abstracts* and the *International Index to Periodicals* index current issues. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106. A *Cumulative Index of the Review*, Volumes 1-62: 1906-1968, may also be obtained from University Microfilms. Articles appearing in the *Review* are listed regularly in *ABC Pol Sci* and *Current Contents: Behavioral, Social & Management Sciences*.

Office of publication: Curtis Reed Plaza, Menasha, Wisconsin.

Foreign Agent: P. S. King and Staples, Ltd., Great Smith Street, Westminster, London.

Second class postage paid at Menasha, Wisconsin. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized May 12, 1926.

Printed in the United States of America by George Banta Company, Inc., Menasha, Wisconsin.

Confronting the Issues

CONTEMPORARY AMERICAN FOREIGN AND MILITARY POLICY

By Burton M. Sapin, The George Washington University

Written by a former member of the State Department, this authoritative study gives attention to both foreign and military policy and their interaction and interrelation. Concerned with the substance of policy as well as policy-making organizations, processes, and politics, Dean Sapin selects readings from a wide variety of sources: books and monographs, professional and popular periodicals, historical documents, and analytical materials. A volume in the Scott, Foresman American Government Reading Series.

LOCAL GOVERNMENT AND POLITICS

Analyzing Decision-Making Systems

By Thomas A. Flinn, Ohio State University

Concentrating exclusively on local government, this conceptual study provides a sophisticated introduction as well as a pedagogically superior method for increasing students' understanding of local political systems and sub-systems. An auxiliary volume in the Scott, Foresman American Government Series, designed for introductory American Government courses.

© 1970, 192 pages, hardbound \$4.95, softbound \$2.95

THE STYLE AND STUDY OF POLITICAL SCIENCE

By Robert E. Murphy, Florissant Valley Community College

This compact guide offers beginning students a means of discovering the various parts which make up the whole discipline of political science. It surveys the field, familiarizing students with important terms, concepts, and methodologies. To help students in preparing assignments, it includes a manual of style outlining the proper forms for book reports, opinion polls, student briefs, and term papers. There is also an extensive bibliography arranged by topic and a list of journals, periodicals, and other primary and secondary sources.

EMOTIONAL EXPERIENCES IN POLITICAL GROUPS: THE CASE OF THE McCARTHY PHENOMENON*

STEVEN R. BROWN AND JOHN D. ELLITHORP

Kent State University

In many ways the study of political groups from a theoretical point of view can be said not to have progressed much beyond the conceptions of Arthur F. Bentley.¹ There have been countless studies of political groups, to be sure, but it seems most have been little more than the collection and presentation of *ad hoc* facts obtained from the testing of *ad hoc* hypotheses, the concepts of "group" and of "group behavior" having been little altered in the process.

Much of the difficulty no doubt stems from Bentley's strict empiricism and the interpretation given his position by most social scientists who have aspired to translate him. When Bentley said that we know nothing of ideas and feelings but only of activity, he was merely reminding the social scientist to remain close to the operations of the phenomena he was studying. Activity, or behavior, can be worked with and studied directly, but it is questionable whether or not the same can be said of ideas and feelings. Scientific progress, Bentley would say, can be made only if one deals with what is visible and replicable. Critics as well as followers of Bentley, however, have interpreted him to mean that such matters as subjectivity are outside the pale of science, since subjectivity is presumed to be private, idiosyncratic, and nonreplicable.

Although Bentley was no friend to subjectivist psychology, all he really required was that there be operations of some kind for one's concepts. If the concept was a subjective one but there were at the same time verifiable operations for it, Bentley would have asked for no more.

* An earlier version of this paper was read at the meeting of the Ohio Association of Economists and Political Scientists, Columbus, March, 1969.

¹ Arthur F. Bentley, *The Process of Government* (Chicago: University of Chicago Press, 1908).

But when he denied the scientific validity of nonoperational-subjectivist notions, social scientists assumed him to be opposed to subjectivity *per se*. *The Process of Government* preceded the development of the operational philosophy in science, but Bentley's thinking was in this tradition.² To him, the question was not whether the data were public or private in origin, but whether or not they could be expressed in terms of verifiable operations. Only the operations needed to be public and replicable.

However, most social scientists have missed this distinction and have therefore proceeded emphasizing only the public, manifest aspects of group life, leaving to the psychoanalysts to speculate, in ways quite unacceptable to Bentley, about the equally important emotional aspects. Contemporary group theorists usually acknowledge an emotional ingredient in group life, but few attempts are made to study these aspects for themselves, largely because such matters are so intangible. Typically, studies are designed with the assumption, erroneous according to Greenstein,³ that these effects can be regarded as random, i.e., as having cancelled out one another so as not to have influenced the results. Despite disclaimers to the contrary, political and social scientists—apart from a handful, such as Robert Lane and Harold Lasswell—remain

² P. W. Bridgman is generally regarded as the father of the operational philosophy, and his intellectual indebtedness to Bentley is reflected in Bridgman, "Error, Quantum Theory, and the Observer," in Richard W. Taylor (ed.), *Life, Language, Law: Essays in Honor of Arthur F. Bentley* (Yellow Springs, Ohio: Antioch Press, 1957), pp. 125-131.

³ Fred I. Greenstein, *Personality and Politics* (Chicago: Markham, 1969), pp. 35-36.

basically disinclined to take subjectivity seriously.

I. BION'S THEORY OF GROUP EMOTIONALITY

It has been suggested by some theorists that individual behavior is phenomenally different from group behavior, but in his study of neurotic psychotherapeutic groups, Bion⁴ contends that the psychoanalytic (individual) and group approaches are merely two different facets of the same phenomenon. This is because group behavior is dual in nature: there is the manifest *work* function for which the group ostensibly is constituted, and there is the *emotional* behavior of the group which co-exists (co-behaves) alongside the work group, following its own independent laws and occasionally interacting with the sophisticated work group.

The work function in group context is analogous to the ego in individual psychology: the sophisticated work group, through its members, is in contact with reality and makes decisions which take reality into consideration; therefore, the work group is interested in learning and development, and in its essentials provides the basis for science. The emotional group, as is the case with the nonrational components of individual psychology, is interested in satisfaction rather than development.

On the emotional plane, individuals wish to contribute anonymously to the group, and if the group has so structured itself as to allow such contributions, it has provided a means for individual evasion and denial of personal responsibility. The *group mentality* is the pool into which these anonymous contributions are made and through which desires and impulses implicit in these contributions are gratified. Thus does one have the individual and his desires on the one hand, and the group mentality on the other in what Kantor calls an interbehavioral field.⁵

⁴ W. R. Bion, *Experiences in Groups* (London: Tavistock, 1961). Essays in this volume previously were published in the following locations: *Human Relations*, 1 (1948), 314-320; *ibid.*, 487-496; *ibid.*, 2 (1949), 13-22; *ibid.*, 295-304; *ibid.*, 3 (1950), 3-14; *ibid.*, 395-402; *ibid.*, 4 (1951), 221-228; *International Journal of Psycho-Analysis*, 33 (1952), 235-247. A summary of Bion's theoretical position can be found in Marshall Edelson, *Ego Psychology, Group Dynamics, and the Therapeutic Community* (New York: Grune and Stratton, 1964), pp. 31-40.

⁵ J. R. Kantor, "Feelings and Emotions as Scien-

The group places requirements and restrictions on the individual, thereby frustrating him. The behavior which results from the interplay between individual needs and group mentality is called *group culture*. Man is a group animal, but this aspect of his psychology frequently is not apparent until he is observed in a group situation—just as the transference phenomena is not obvious until analyst and analyzed are together, although the analyzed always has the capacity for transference. However, in order to produce certain aspects of group phenomena it is not necessary to place individuals physically in a group. In fact, as Bion says, "... no individual, however isolated in time and space, should be regarded as outside a group or lacking in active manifestations of group psychology."⁶ An actual group merely brings into prominence certain behavioral phenomena not readily obvious in the absence of the group. Of group cultures, Bion says there are three basically different kinds, each culture distinguished from the others according to the basic assumption which appears to govern it.

The Basic Assumption of Dependence. The first basic assumption Bion discusses is that of dependence in which group members on an emotional level depend on someone (e.g., the leader) or something (e.g., tradition, the group bible, etc.). The group's behavior is made more understandable if it is assumed "that the group is met in order to be sustained by a leader on whom it depends for nourishment, material and spiritual, and protection."⁷

This is a rather immature emotional situation, similar to the infant's egocentric relationship to the parent,⁸ resulting in great inefficiency in

tific Events," *Psychological Record*, 16 (October, 1966), 377-404.

⁶ Bion, *op. cit.*, p. 169.

⁷ *Ibid.*, p. 147.

⁸ "Egocentric," that is, in the sense in which it is used by Jean Piaget, *The Moral Judgment of the Child* (New York: Free Press, 1965), to refer to that stage in which the child unilaterally defers to the generalized Elder. Under certain conditions, this respect for parents is transferred to other authority figures, such as political leaders, as has been described by D. Wilfred Abse and Lucie Jessner, "The Psychodynamic Aspects of Leadership," in Stephen R. Graubard and Gerald Holton (eds.), *Excellence and Leadership in a Democracy* (New York: Columbia University Press, 1962), pp. 76-93.

group relationships. The leader-follower relationship is direct and personal as far as the follower is concerned, with little gratification obtained from group relations. Each individual desires the leader's complete attention (just as the child wishes to dominate parental attention) and all members of the group combined therefore tend to frustrate any given member. Such a situation is frequently accompanied by resentment at being placed in a dependent position; by guilt about having been greedy; by insecurity, frustration, and a consequent desire to avoid the group situation itself; and by anger and jealousy. In his hospital groups of this type, Bion observed that one individual is typically elevated to the position of leader, and if left to its own devices the group, in search of someone congruent with the basic assumption of dependency, will select from its midst its most psychologically-ill member, the "psychiatric winner." This phenomenon occurs in this type of group because that individual who wishes to be depended upon is most apt to find his needs complemented by a group with members who in turn are looking for someone upon whom to depend. That person with greatest need to be sustained and nourished by the group (i.e., who depends on the group) typically is not the group's strongest member; indeed, from a characterological standpoint, he is frequently its weakest.

Devereux has suggested that such dynamics operate in political groups as well:

... power, infantilism and dependency always occur together. Some charismatic leaders were infantile and dependent long before they rose to eminence, and were actually elevated to social leadership because their behavior fitted the childish expectations of their potential followers. In other instances initially reasonably normal persons gradually become infantile and dependent as a result of having had power foisted on them.⁹

Under these conditions, Lord Acton's principle

⁹ George Devereux, "Charismatic Leadership and Crisis," *Psychoanalysis and the Social Sciences*, 4 (1955), 150-151. This group search for a suitable leader is a matter of elite recruitment, and whereas the political scientist is more accustomed to thinking of an elite controlling and manipulating the mass, roles are reversed in this case: the leader is manipulated by the group, being forced in a sense to play the lead role in the common group fantasy. See Bion, *op. cit.*, p. 149.

can be rephrased to read: power infantilizes, and absolute power infantilizes absolutely.

In this dependent group, all interaction is leader-member oriented: member-member interactions are minimized for there is a feeling on the part of the individual that the group can be of little help to him; all reliance is placed on the leader. It is this kind of leadership which typically is described by the psychoanalyst turned political analyst, largely as a function of the kinds of persons and groups with which the analyst is accustomed to dealing.

The Basic Assumptions of Pairing. The psychoanalytic social theorists, in emphasizing dependency, have tended to overlook other group-leadership possibilities, but Bion has described a second basic assumption group, which he calls the pairing group, wherein the group's behavior can be best understood if it is assumed that the group comes together in order to break down into smaller groups, i.e., to pair off. While in the dependent group the leader is typically visible and very real, a characteristic of the pairing group is that the leader—who is looked upon as a hero, genius, or Messiah—is unborn, i.e., is not physically present. Accompanying the pairing group, in which paired subgroups virtually ignore the larger group, is a feeling of hopeful expectation and optimistic anticipation, usually expressed in statements to the effect that conditions will improve or problems will be solved with the coming of some future event—a change in the season, a new group, a new leader, a new idea, etc. Pairing has overtones of sexuality, and the spirit of messianic hope is both a part of sexuality and a precursor of it.

Bion indicates that the optimism serves as a rationalization for guilt which derives from pleasantries characteristic of pairing behavior; however, such pleasantries are tolerated because of the importance of the ultimate goal, whatever it may be. Unlike the dependent leader, the leader of the pairing group cannot present himself and must always remain unfulfilled; otherwise, the hope characteristic of this group could not be sustained and feelings of hatred, destructiveness, and despair avoided. Optimism is therefore a defense against despair, on the one hand, and hostility, on the other (i.e., a group defense against individual tension), which points up the dynamic relationships among the various basic assumption groups.¹⁰ Since the leader of

¹⁰ Bion, *op. cit.*, p. 151. Optimism as a rationalization is an attempt to effect a time displacement.

the pairing group is absent, all interaction in the group is member-member oriented.

The Basic Assumption of Fight-Flight. The third basic assumption group delineated by Bion is that of fight-flight in which the group, almost indifferently, gathers together either to fight a common enemy or to run away from one. The leader is that individual who facilitates aggression (hostility) or evasion (avoidance, withdrawal, irrelevancy, etc.), depending on the occasion. Under these conditions, group members regard methods of dealing with a problem other than by fighting or fleeing as either nonexistent or contrary to the best interests of the group. Bion observes that the group dominated by the fight assumption typically will select for its leader that member with most marked paranoid tendencies since if members of the group cannot see the enemy, the next best thing is to choose as leader someone who apparently can.

Group members need not necessarily manifest their aggression or evasion in physical acts. Should a problem present itself, a group governed by the flight assumption, for example, might flee from the problem by denying its existence (denial), underplaying its importance (rationalization), or over-emphasizing reason in dealing with the problem (intellectualization). Lapsing into silence and refusing to talk is a way of avoiding a problem, changing the subject is another, and not showing up to meetings of the group is still another evasive technique.¹¹ All such are examples of individual efforts to flee from the problem at hand, to avoid a confrontation. Suicide, of course, is the ultimate in flight behavior.

Intragroup and Intergroup Dynamics. It is important to note that these three emotional group cultures are not necessarily opposed to one another: cultures can alternate within the

same group of people, sometimes rapidly and sometimes very slowly. Frequently different emotional strategies are used unknowingly by group members to protect the group. As an example, a group may be operating initially according to the dependent assumption. If the leader, however, attempts to democratize the group—e.g., by dispersing power and decision-making—and if group members do not wish to take on responsibilities for their own futures (preferring instead to leave this to the leader), then the group may switch to a flight stance in order to protect itself—e.g., by “pretending” not to understand the leader and what he is trying to do. Bion found patients in some groups so unwilling to be cured as to band together in silence as if to deprive him of the information necessary to effect their cures—an example of a group fighting a common enemy, the therapist, who was the shared source of individual anxiety.

Alternatively, a group may take evasive pairing action in order to isolate a threat—e.g., by talking amongst themselves and ignoring the leader. The group, as an organic whole, in this sense is capable of strategically changing the basic assumption upon which the membership has operated in order to adjust to changing circumstances. It is not unusual to see members of a group isolate a stranger in their midst, particularly if he is threatening, by suddenly turning their backs on him, even if only symbolically, and talking amongst themselves. In this way the group protects the purity of its membership by adopting the pairing assumption. (It was this tendency to maintain the “purity of its membership” which led Bion to suggest an aristocratic bias in the pairing group.)

What has been described thus far is strictly the emotional side of the coin. Groups have their sophisticated, or work, functions which are reality oriented and which can therefore, from an analytic point of view, be treated quite separately from the emotional behavior, although the two kinds of behavior are dynamically related and have analogous components. For example, work groups stress *cooperation* which is characteristically voluntary, rational, and dependent to a certain degree on the mental and motor development and experience of the individual involved. The equivalent basic-assumption term is *valency*, a term Bion borrowed from physics “to express a capacity for instantaneous involuntary combination of one individual with another for sharing and acting on a basic assumption.”¹² So while cooperation is voluntary, rational, and learned, valency is involun-

the rationalization thereby producing a futuristic outlook. The rationalization, however, is a defense against a present (not future) threat. Any immediate behavior, therefore, must contain what Ezriel calls a “because clause”: a person adopts one course of futuristic behavior and avoids another *because* he fears the consequences of the latter, and not because he is genuinely interested in the possibilities of the former. See Henry Ezriel, “Notes on Psychoanalytic Group Therapy: II. Interpretation and Research,” *Psychiatry*, 15 (1952), 119-126.

¹¹ Absence as flight behavior is illustrated in Eléonore L. Herbert and E. L. Trist, “The Institution of an Absent Leader by a Students’ Discussion Group,” *Human Relations*, 6 (1953), 215-248.

¹² Bion *op. cit.*, p. 153.

tary, inevitable, and purely automatic, an expression of the gregariousness in man's personality and the prime determinant of the extent of an individual's interaction on the basic assumption level. Just as individuals differ with regard to the amount of cooperation which they are willing to contribute to a task situation, so individuals differ in the amount and kind of valency which they are capable of expressing in particular basic assumptions situations. The emotional group leader frequently holds his position by virtue of his valency; i.e., because he is the personification of the group's basic assumption.¹³

Bion suggests that certain groups are set aside for specialized functions in a society, each group demanding and functioning best with a certain kind of leadership congruent with the basic assumption of the group: the church places a premium on dependency valency, and members can combine with one another almost instantaneously to form a dependency structure on an emotional level; the aristocracy, Bion presumes, is endowed with pairing valency, able to protect the purity of its strain and to obtain gratification from the sexual symbolization of the pairing group; and the military, of course, draws a disproportionate number of individuals prepared to augment the fight assumption.

Again, two kinds of behavior are progressing simultaneously within the same group of individuals and operating according to quite different laws of behavior: the work group follows one set of reality-bound laws and is devoted to development through time; the emotional group follows another set of laws unrelated to reality or time—more properly, bounded by its own sense of reality and time. Bion's methodology can be compared to the different ways of looking at this cube: looked at one way corner AB

¹³ Cecil A. Gibb ("The Principles and Traits of Leadership," *Journal of Abnormal and Social Psychology*, 2 (July, 1947), 267-284) earlier pointed to the relationship between an individual's being a leader and his ability to embody many of the qualities of his followers.

is closest, while looked at another way CD is closest. Similarly, as Bion notes "in a group, the total of what is taking place remains the same, but a change of perspective can bring out quite different phenomena."¹⁴

It may seem like a big jump from the small therapy groups with which Bion dealt to the large-scale groups with which political scientists are expected to deal, but Bion's contention is that all groups—indeed, whole cultures—will behave according to one of these three basic assumptions. He suggests, for example, that the Egypt of the Pharaohs exemplified an entire civilization geared to implement the basic assumption of dependency, with all human energy devoted to obedience toward, and the coddling of, a central figure. The childishness of the Roman Emperor Caligula might also be pointed to as the pattern of behavior consistent with that which might be expected under conditions of dependency. More recently, wartime Germany would seem to illustrate a society dominated primarily by the fight assumption, and Adolph Hitler's oft-mentioned paranoia coincides with that expected to characterize the leader under these conditions.

Accepting Bion's theory as tentative—and Bion recognizes this tentativeness—we should be able to find some evidence supportive of his contentions with any group whatever, political or otherwise. In principle, it should not matter whether the group under immediate scrutiny is a political party, pressure group, street-corner gang, professional gathering of Ph.Ds, or whatever—i.e., since the theory presumably applies to the emotional behavior of groups, we should be able to select any group irrespective of its rational task so long as it is structured in such a way as to permit emotional expression. Modern political science has been prone to study the work functions of various groups, and much of the technological development associated with the behavioral persuasion has been in support of this important but limited interest. However, Bion warns that "since work-group functions are always pervaded by basic-assumption phenomena it is clear that techniques that ignore

¹⁴ Bion, *op. cit.*, p. 87. One might also make an analogy to the focussing of a camera lens: if one focusses on the foreground, the background becomes blurred; if, on the other hand, one focusses far away, objects close by will become blurred. This does not mean that the objects close by do not exist, only that attention has been directed elsewhere. Similarly, the study of emotional group behavior does not deny the existence of task-oriented behavior.

the latter will give misleading impressions of the former."¹⁵

The following is an illustration of how Bion's theory might be applied to political groups, in this instance involving the followers of Senator Eugene McCarthy during his 1968 bid for the Democratic party's nomination for President.

II. DESIGN OF THE STUDY.

For instrumental purposes, Bion's theory can be reduced in its essentials to a completely randomized design with two main effects in factorial arrangement,¹⁶ as indicated in Figure 1. In this instance, there are $3 \times 2 = 6$ combinations of the two main effects: *ad* Dependency, *ae* Counterdependency, *bd* Pairing, *be* Counterpairing, *cd* Flight, and *ce* Flight.

In early autumn, 1968, members of a graduate seminar in political behavior sought out and interviewed in depth supporters and former supporters of Senator McCarthy. The statements of opinion by the respondents—along with statements from another source¹⁷ rewritten specifically for this study, as well as some items which were invented by the authors—provided us with a population of approximately 250 statements covering the McCarthy phenomenon domain, including statements about group experiences. From this population were sampled 60 statements, 10 theoretically representing each of the six combinations in Figure 1. The following are illustrative:

I think that a man like McCarthy, even though he had failed, would have made the country proud. He was a man I could follow. (*ad* Dependency)
I did not like McCarthy as a person, but I liked his ideas. (*ae* Counterdependency)

¹⁵ *Ibid.*, p. 154.

¹⁶ See Roger E. Kirk. *Experimental Design: Procedures for the Behavioral Sciences* (Belmont, Calif.: Brooks/Cole, 1968), pp. 171-229.

¹⁷ Dorothy Stock and Herbert A. Thelen, *Emotional Dynamics and Group Culture* (New York: New York University Press, 1958). The statements, the factorial combinations they represent, and their factor scores (to be discussed subsequently) can be obtained from the authors.

The McCarthy phenomenon has allowed me to hope that changes will be made. I am confident that by 1972 someone will emerge to provide the leadership we need. (*bd* Pairing)

I didn't have much time for those who were interested in McCarthy because it was "the thing" to do. It wasn't supposed to be fun. (*be* Counterpairing)

Maybe we weren't defeated after all. Maybe McCarthy did his job: He got rid of L.B.J. didn't he? Besides, it's not over yet by any means. (*cd* Flight)

I don't think about McCarthy anymore. I was shocked by the result of the convention, and now I have no intention of participating further. (*ce* Flight)

For purposes of this study, the items and the factorial design they represent are theoretical matters. The design is used to aid in the generation of what Brunswik calls a representative stimulus situation: by following the structure represented in the design, we insure situational comprehensiveness on theoretical grounds.¹⁸ Rather than scale scores, which are the raw data of scaling methodology, our basic datum is what the respondent does with the items, i.e., we are interested in the subjects' operations as they manipulate the statements. Any meanings or significances to be attributed to these behavioral operations come after the respondent has behaved rather than before.

The operations are provided in the context of *Q* technique, a modified ranking procedure described by Stephenson.¹⁹ The 60 statements are

¹⁸ Egon Brunswik, *Perception and the Representative Design of Psychological Experiments* (Berkeley and Los Angeles: University of California Press, 1956). More appropriate for the methodology employed here, see Steven R. Brown, "On the Use of Variance Designs in *Q* Methodology," *Psychological Record*, in press; and S. R. Brown and Thomas D. Unga, "'Representativeness' in the Study of Political Behavior," forthcoming.

¹⁹ William Stephenson, *The Study of Behavior: *Q*-technique and Its Methodology* (Chicago: University of Chicago Press, 1953). A guide to literature on this technique is to be found in S. R. Brown,

randomly numbered, typed on cards, and presented to the respondent who is asked to provide his viewpoint. To facilitate this task, he is presented with an opinion-continuum from +5 (most agree) to -5 (most disagree), with 0 (neutral, ambiguous, etc.) in the center, as follows:

Score	(most disagree)				(most agree)						
	-5	-4	-3	-2	-1	0	+1	+2	+3	+4	+5
Frequency	4	5	5	6	6	8	6	6	5	5	4

Rather than responding to each item singly, as in a questionnaire, respondents individually display all items along the continuum with a given number being required to be placed beneath each category to implement comparability of response.

The respondents themselves were obtained in a manner similar to the way in which statements were obtained, i.e., by design, as in Figure 2. It was presumed that McCarthy activists would have had differing group experiences compared to those who wore McCarthy buttons only; similarly, it was expected that women might have reacted to McCarthy differently from men.²⁰ All respondents therefore were Mc-

Carthy supporters, but an activist was the kind of person who contributed heavily of his time: Most had attended the Democratic National Convention or traveled to the various state primaries. The sample was small— $N = 34$ respondents—but quite sufficient for exploratory purposes, as will be indicated.

Data-gathering took place during a period of time just prior to the November, 1968, general election. Each respondent in the study provided his ranking of the statements (from "most agree" to "most disagree") and all 34 Q sorts were intercorrelated, providing a 34×34 matrix, and the correlation matrix was factor analyzed. Five principal axis factors resulted and were rotated to a position in simple structure, as shown in Table 1. This means that of the 34 separate Q sorts provided by the respondents, the statements were distributed in only five basically different ways. At this point it is possible to identify those individuals who cluster together—i.e., those who organized the statements in a similar fashion and therefore, from Bion's perspective, demonstrate common valency—and construct one Q sort from a weighted average of all their separate Q sorts. This then reduces the data to five Q sorts, representing five different points of view about the McCarthy experience, and these can be looked at separately and comparatively for any implications that might be derived in terms of Bion's theory.²¹

III. THE FACTORS AND THEIR INTERPRETATION

Factor 1—Dependence. The first factor is composed of respondents 1-6 (Table 1) and

"Bibliography on Q Technique and Its Methodology," *Perceptual and Motor Skills*, 26 (April, 1968), 587-613. The Q -sorting session in this instance becomes an experimental situation (similar to the psychoanalytic session described by Ezriel, *op. cit.*, pp. 122-123), which allows the respondent to enter into the object relationships in a dynamic way as they are represented in the Q -sample structure. If Bion's theory is correct, some respondents will resonate to some items, will become defensive toward others, and so forth, and in a systematic way.

²⁰The importance of sex differences in political orientations has not been stressed often enough. Men and women are reared under different sets of contingencies, and as a consequence each sex develops a prior readiness to perceive certain events to which the other is oblivious, as subsequent results indicate. See Irving E. Sigel, "Rationale for Separate Analyses of Male and Female Samples on Cognitive Tasks," *Psychological Record*, 15 (July, 1965), 369-376.

²¹Most factor work proceeds by correlating tests across a sample of persons. Inverted factor work, of which this study is an example, proceeds by correlating persons across a sample of tests, where "tests" in this case are Q statements. Correlation under these conditions indicates the extent that respondents did or did not rank the statements in essentially the same pattern, providing us with

Decimals have been omitted. Respondents' saturations exceeding ± 40 are significant ($p < .01$).

can be best described as dependent in nature, not just because it gives some of the dependent statements high marks, but because the marks

an indication as to how the audience was segmented relative to the phenomenon. Factors now represent clusters of likeminded persons, not clusters of traits. (See Stephenson, *loc. cit.*, for the differences between *Q* and *R* factor analysis.) Further, the factors in this study are inductive, such that individual membership in a factor is

given other statements as well betray what is called here a dependent stance. The factor is proud of the leader, Senator McCarthy, and

nonarbitrary: Respondents 1-6 in Table 1 are members of factor 1 because they organized the statements in essentially the same way. The factor array is simply their six *Q* sorts, which are already similar, averaged together. The factors then are nonarbitrary types, or classes (operants), in Skinnerian terminology. (See B. F. Skinner, *Contin-*

defends him, as indicated by the scores given the statements which follow:²²

8. I did not like McCarthy as a person, but I liked his ideas. (−5)

16. I think that a man like McCarthy, even though he had failed, would have made the country proud. He was a man I could follow. (+5)

35. McCarthy was too stubborn, too idealistic. He should have compromised more. (−5)

42. Until McCarthy announced, I was getting kind of unsure of the future. I must say, I really felt relieved to have someone like him stand up for what I believed. (+4)

53. McCarthy was not a serious candidate because he was never emotionally involved in the race. Had I been in his place, I would have been more aggressive. (−5)

Characteristic of the dependent group, as described by Bion, is the orientation of the member to the leader and the relative dissociation of the member from other group members. It is not surprising therefore to find factor 1 disavowing any pleasures were derived from group activity:

2. I found I could always speak intimately with other McCarthy people. In fact, the whole movement was intimate. (−3)

6. Although I supported McCarthy as a candidate, I didn't bother to take the time to become deeply involved with other McCarthyites. (+4)

13. As I look back on it, the best times were when we would campaign in groups of two or three—door-to-door, over coffee, at social gatherings. (−2)

gencies of Reinforcement (New York: Appleton-Century-Crofts, 1969), pp. 127-132.) Much typological work, on the other hand, is arbitrary with respondents assigned to a type or not as a function of operations performed by the investigator: For example, whether a person is typed as a moron, nincompoop, or genius depends on the magnitude of his IQ relative to the arbitrary cut-off point imposed by the test-giver. In the present study, however, respondents classify themselves by behaving or not behaving alike as manifested in the intercorrelations based on their independent card sortings.

²² Scores for statements in each factor range from +5 (most agree) to −5 (most disagree) with the same frequency as in the forced distribution above. Each factor at this point can be regarded as an operant possibility, i.e., in principle an individual exists who would provide this arrangement of the statements to represent his own viewpoint. When factors are referred to as if they were persons, therefore, reference is to the operant possibility of which those loaded on a factor are approximations.

Instead, factor 1 stresses the impersonal, intellectual, and philosophical aspects of the movement:

27. I was oriented more toward the McCarthy movement as a whole than toward particular individuals in it. (+4)

50. During the primaries, I always preferred to discuss the issues in intellectual rather than personal terms. (+4)

55. I was primarily interested in the philosophical implications behind the McCarthy movement. (+5)

Such behavior would suggest that flight behavior was employed to protect a basically dependent orientation, and there is good evidence the factor withdrew from threatening or competitive situations:

3. Frankly, I'm tired of the whole mess—Republicans, Democrats, even McCarthy and politics in general. When these things come up, I would just as soon change the subject. (+3)

4. I have strong views, and whenever I got together with other McCarthy people, I always contributed my 2-cents worth. (−3)

20. I really feel as though I played an active, influential role in the McCarthy movement—at least as far as one individual could. (−5)

28. During the primaries, if I heard anyone say anything against McCarthy, I was immediately prepared to debate. (−4)

Although the factor declares an interest in the intellectual aspects (nos. 50, 55), elsewhere it seems to betray a wish that the entire situation would vanish (no. 3)—hardly an intellectual posture. Indeed, there is evidence the factor is unwilling to face the realities of the leader's defeat, a characteristic of the dependent syndrome mentioned by Bion and substantiated by reaction to this statement:²³

29. When McCarthy lost the nomination, I felt as though I had lost, too. After him, I felt there was no one left I could look up to. (0) [Factors 2, 3, 4, and 5 scored this item +3, +3, −5, and +4, respectively.]

Only factor 1 fails to react strongly to this statement, one way or the other, indicating only factor 1 has failed to come to grips with what is implied.

In light of these observations, it is of considerable interest to find in Table 1 that the largest number of persons associated with factor 1 are women: female respondents, 1, 2, 3, and 5 are

²³ Bion, *op. cit.*, pp. 120-121. In Bion's psychoanalytic framework, the failure of the dependent type to react to such a statement would reflect an unwillingness to accept the symbolic death of the leader.

all pure for the factor. Women as a class do not typically become involved in direct political action, and upon becoming active some might therefore be expected initially to experience a feeling of incompetence, perhaps followed by withdrawal and a façade of pseudo-intellectuality. Further, women more than men tend to be socialized into being submissive to authority figures (fathers, husbands, bosses, etc.), and political novices finding no other criteria upon which to rely for the evaluation of an immediate and complicated political phenomenon might easily regress to earlier internalized infantile reaction patterns.²⁴ When in a situation of conflict, individuals select that framework for dealing with the situation which they have relied upon before. If the nearest framework happens to be that which was learned early in one's life space, lacking other alternatives it will just have to suffice.

Factor 2—Pairing. This factor comes closest to following the behavior described by Bion as pairing, as indicated by the scores assigned the following statements:

9. I was sometimes reluctant to go to rallies and work meetings. I didn't like to get all worked up emotionally, even about McCarthy. I was for him, and that was enough. (—2)
11. I suppose I was fairly unresponsive to friendly gestures from other persons in the McCarthy group, but I was generally too involved with the "cause" to waste time socializing. (—4)
19. I had a tendency to remain somewhat detached from the rest of the McCarthy people—they always impressed me as being rather cliquish. (—3)
21. I didn't have much time for those who were interested in McCarthy because it was "the thing" to do. It wasn't supposed to be fun. (—4)
26. McCarthy was an intellectual. The average person did not understand him. To understand him

²⁴ See footnote 20. Wiebe found the same phenomenon in the reaction of women to Senator Joseph McCarthy during the televised Army-McCarthy hearings of the 1950s. See G. D. Wiebe, "The Army-McCarthy Hearings and the Public Conscience," *Public Opinion Quarterly*, 22 (Winter 1958-1959), 490-502; Wiebe, "Social Values and Ego Ideal: Recollections of the Army-McCarthy Hearings," *Psychoanalysis and the Social Sciences*, 5 (1958), 164-186. The 1968 McCarthy phenomenon lent itself to emotional expression since a large number of his followers were novices who brought with them no previous political experiences upon which to draw. The mass character of the movement is illustrated in William P. McDonald and Jerry G. Smoke, *The Peasants' Revolt: McCarthy 1968* (Mt. Vernon, Ohio: Noe-Bixby, 1969).

- you have to be educated—above average. (+3)
44. Even at the Democratic convention, right up through the voting of the states, I hoped and prayed that McCarthy would get the nomination. (+5)
48. The McCarthy phenomenon has allowed me to hope that changes will be made. I am confident that by 1972 someone will emerge to provide the leadership we need. (+5)
52. The McCarthy movement could have attracted more support if its members hadn't of acted like they were part of an exclusive club. (—5)

The aristocratic bias of the pairing viewpoint, as suggested previously, is emphasized at least indirectly by such statements as no. 26 (which implies that the respondent is above average), while the accusation that the movement was in fact exclusive (no. 52) is strongly denied. Highly characteristic and distinguishing for this factor is the feeling of hope which Bion said would be associated with the pairing attitude as defense against despair. Statements 44 and 48 are particularly indicative of this messianic posture. Bion also postulated a kind of sexuality to accompany pairing, and although the factor 2 type may tend to display a kind of exclusiveness toward out-group members, statements such as nos. 9, 11, 19 and 21 would indicate a feeling of intimacy, affection, and playfulness toward those inside the group. As an aside, it is interesting (and theoretically comforting) that the female respondent with the highest saturation on this factor was not only the vice president of a local group supporting McCarthy, but also the steady girlfriend of the president of the same organization.

Despite its natural tendency to display warmth, the pairing factor also has the capacity to become aggressive:

28. During the primaries, if I heard anyone say anything against McCarthy, I was immediately prepared to debate. (+4)
46. Whenever McCarthy or his followers were attacked, I tended to defend them. (+4)

This acceptance of fight behavior on the part of the pairing group was also found by Stock and Thelen,²⁵ and while it appears incongruent with the friendliness presumably characteristic of this factor, apparently no one is more surprised at this than is factor 2 itself, as witnessed by the following response:

45. During the McCarthy days, I was sometimes surprised at my own willingness to get involved in intense arguments. (+4) [Factors 1, 3, 4, and 5 scored this item —1, —4, +3, and +2, respectively.]

²⁵ Stock and Thelen, *op. cit.*, pp. 43-44.

As can be seen from differential scores assigned this statement, being surprised at one's own aggressiveness is not characteristic of factor 3, to which we now turn.

Factor 3—Fight. This factor is geared for the expression of aggression, and while the dependent factor 1 was primarily female in membership, factor 3 is masculine: no female has a pure saturation on this factor. (See Table 1.) The fight posture is indicated by the following statements and their accompanying factor scores:

12. McCarthy not only talked as others did, but came out and demonstrated. He knew it was difficult to go against the Johnson Machine, but he was not afraid to try. (+4)
18. McCarthy himself was not really that important. "The Movement" was looking for him and accepted him, but it also preceded him. (+4)
25. Maybe we weren't defeated after all. Maybe McCarthy did his job: He got rid of L.B.J. didn't he? Besides, it's not over yet by any means. (+5)
31. I was glad McCarthy didn't endorse anyone at the convention. I figured, if he was going to buck the system, he should go all the way. (+5)
41. I supported McCarthy because he bucked the political system. He knew the strength of the Johnson Machine, but chose to go ahead regardless of the consequences. (+5)
60. I liked McCarthy's attitude after the convention. Humphrey acted like it was a kid's game where everyone shakes hands after it's over. McCarthy realized it wasn't a game, that the issues still existed. (+5)

The kind of person who would give the factor 3 statement ranking as his own would be a person prepared for political battle. The main enemy for factor 3 is President Johnson, and Senator McCarthy is admired and supported for opposing the President. Any suggestion of withdrawal or retreat—in short, of *flight*—is incongruent with the prevailing basic assumption and therefore is rejected:

3. Frankly, I'm tired of the whole mess—Republicans, Democrats, even McCarthy and politics in general. When these things come up, I would just as soon change the subject. (—5)
17. When McCarthy endorsed Humphrey, it was his recognition that you can't beat the system. I don't blame him I think he's probably right. (—4)
22. I don't think about McCarthy anymore. I was shocked by the result of the convention, and now I have no intention of participating further. (—5)

Bion's concept of valency is well illustrated in the case of the fight-oriented factor 3, particularly when compared, as in Table 2, with the

TABLE 2.—VALENCY IN THE FIGHT FACTOR

	Dependence	Pairing	Fight
I tend to be impulsive in expressing my feelings about "the system," the War—the whole bit. And I think the McCarthy movement brought this out in me more than ever.	—3	—4	+2

other factors thus far considered in the score-assigned statement 58. Factor 3 to some extent recognizes in itself an aggressive tendency and following Bion, is cognizant of the fact that the McCarthy movement was probably more catalytic than causal as far as the expression of this aggression is concerned; the score assigned statement 18 (*supra*) also supports this. Bion therefore seems to be on the right lines: "... the accepted leader of a group in this [fight-flight] state is one whose demands on the group are felt to afford opportunity for flight or aggression and if he makes demands that do not do so, he is ignored."²⁶ McCarthy's continued opposition to Hubert Humphrey, even after the Democratic party had made its convention decision, was perhaps an attempt to retain the loyalty of the factor 3 type, i.e., implicit recognition by McCarthy that if he did not afford the opportunity for opposition that he might indeed be ignored by a large and effective segment of his following.²⁷

²⁶ Bion, *op. cit.*, p. 152. The fight orientation, as is the case with the other basic assumptions, can have a persistent quality. In a speech before a 1969 graduating class, McCarthy reportedly received his biggest ovation for the following statement: "You may be called upon to cross the Red Sea knowing it will close on you—and, having made the passage, realize that you may be called upon to make the passage again." See Susan Brownmiller, "Eleven Months After Chicago: Gene McCarthy Is Waiting for a Sign," *New York Times Magazine*, July 20, 1969, p. 25. Upon the same occasion, a McCarthy supporter is also reported to have said, "Really like old times. Even the Boston Globe said he was welcomed like a returning hero. . . . A lot of us are prepared to go the route with him again." It would be difficult to find a clearer expression of the leader-follower relationship in the fight context.

²⁷ McCarthy's implicit recognition of his followers' wants frequently borders on the explicit. As he was again reported to have said (in Brownmiller, *ibid.*, p. 18), "Last year I was more outspoken than anybody. I fought the fight where it should have been fought. What is it that people

4. I have strong views, and whenever I got together with other McCarthy people, I always contributed my 2-cents worth.	-3	3	-1	5	3
15. Although I was part of the McCarthy movement, I wasn't always in agreement with McCarthy himself, and I often said so.	2	1	2	5	0
29. When McCarthy lost the nomination, I felt as though I had lost, too. After him, I felt there was no one left I could look up to.	0	3	3	-5	4
33. It's hard for me to express what it was about McCarthy that attracted me, but as far as I'm concerned, he would have been the difference between the President and my President.	2	5	-1	-3	2
37. Most of McCarthy's followers will probably disagree with me, but I didn't think he was as graceful in defeat as he was in victory.	-1	1	-5	5	-2
57. While McCarthy was still in the running, I was deeply interested in this year's race, but when he didn't make it, I didn't much care who won.	1	-1	-1	-5	2

Factors 4 and 5. These two factors are of interest because they appear to be specific to this particular political phenomenon: they probably would not have emerged had the data been collected prior to the Democratic Convention. Factor 4 in a sense represents the other side of the emotional coin to the dependent factor 1 and may be characterized as "counterdependent." This is not to say factor 4 was opposed to McCarthy for all respondents in this study were or had been McCarthy supporters. Factor 4 was just not as much taken by the movement, appears a bit disgusted with Senator McCarthy's intransigence, looks at matters in a more emotionally-detached manner compared to the other factors, and in its present stage comes closest to Bion's concept of the work group, as indicated by the scores assigned the statements in Table 3. Factor 4 persons appear not as committed to McCarthy *per se* but, in contrast to the other factors, more goal-oriented. These were probably the loyal Democrats who made up factor 4, and when McCarthy lost the nomination, they were prepared to move in behind the winner.

Stock and Thelen mention that counterdependency is characterized by high work orientation, rejection of hostility, and rejection of flight of the irrelevancy type,²⁸ and factor 4 appears to

would have me do now? . . . What is it that people want from me?"

²⁸Stock and Thelen, *op. cit.*, p. 44.

fit this description. The factor appears willing to discuss the political issues on a rational, but not on an emotional, level. Useless hostility (fight) is rejected as is an attitude of "dropping out," i.e., irrelevant flight. It is worthy of note that this factor, as was the case with factor 3, is primarily male in composition and in its attitude toward the group leader is most opposite to the supportive attitude expressed by factor 1, which was primarily female.

Factor 5 also appears to be an attitude existing as a function of events surrounding the Democratic Convention. Respondents from this factor probably would have been associated with the bitter-enders of factor 3 prior to the Convention, but while factor 3 continues an uncompromising fight stance, factor 5 has surrendered and might therefore, as a first approximation, be labeled "defeatist." The statements in Table 4 would tend to indicate factor 5 was highly committed to McCarthy on a personal basis, but in the face of defeat is prepared to give up, when compared to the readiness of the other factors, at least to give up on the political system as it presently exists. Factor 5 wanted only McCarthy and when he lost, the loss was personal and total.²⁹ Factor 5 sees the course of

17. When McCarthy endorsed Humphrey, it was his recognition that you can't beat the system. I don't blame him—I think he's probably right.	-4	-2	-4	-2	1
18. McCarthy himself was not really that important. "The Movement" was looking for him and accepted him, but it also preceded him.	2	4	4	3	-1
22. I don't think about McCarthy anymore. I was shocked by the result of the convention, and now I have no intention of participating further.	-4	-2	-5	-5	1
25. Maybe we weren't defeated after all. Maybe McCarthy did his job: He got rid of L.B.J. didn't he? Besides, it's not over yet by any means.	-1	-1	5	0	-3
40. A minority of people felt the way McCarthy did and they knew he would lose, but what endeared him to his supporters was that he would be glorious in defeat.	1	2	0	1	-4
48. The McCarthy phenomenon has allowed me to hope that changes will be made. I am confident that by 1972 someone will emerge to provide the leadership we need.	3	5	4	2	-4

²⁹For example, respondent 21, with the highest factor loading on factor 5 (Table 1), attended the Convention and reported being so angered at McCarthy's loss that he refused to return to

events as being immediately crucial: the McCarthy defeat indicates the system cannot be beaten (nos. 17, 48), at least from within. And while factors 1, 2, 3, and 4 intend to continue participating, factor 5 is uncertain (no. 22) and generally appears to be in the process of withdrawal.

This factor comes closest to flight behavior, but not enough to be so labeled at this point. One might speculate that genuine flight would have occurred had the leader publicly lead at least a symbolic retreat—e.g., by urging his followers to become apathetic and to withdraw from participation. If such had occurred there is little doubt that factors 3 and 5, who were most involved in the attack, would have been disproportionately represented in the retreat. Such polar behavior is to be expected from the fight-flight syndrome.

IV. GROUP EMOTIONALITY AND ANXIETY

Despite the fact that the respondents tended to segment into five relatively independent

the floor of the Convention even to listen to the acceptance speech of the Democratic vice-presidential candidate, Senator Edmund Muskie, and refused to vote for any presidential candidate in the general election. Bion has suggested (personal communication) that factor 5 may represent an attitude of hatred toward thoughtful observation itself, a kind of fight-flight behavior. If so, he speculates the depression characteristic of the factor could have two contradictory roots: Failure of the liberal-scientific attitude to prevail and failure to destroy the liberal-scientific attitude. Such duality has been expressed as well in pure science in what Beveridge, interestingly enough, has chosen to call the "attack-escape" reaction to new ideas. The premature ridicule heaped on new ideas in science is the very antithesis of the scientific attitude, and although the scientific attitude, as a consequence, does not prevail, neither is it destroyed. See W. I. B. Beveridge, *The Art of Scientific Investigation* (New York: W. W. Norton, 1951), pp. 105-106.

points of view regarding their experiences in the McCarthy movement, there are certain matters about which there was consensus. One such revolves around the function played by McCarthy's entrance into national politics, and the factor scores for statement 42 (Table 5) would seem to indicate all factors experienced a positive feeling of relief that a person of his stature and who shared their beliefs was willing to speak out. Bion, following Freud, hypothesizes anxiety as an important aspect of group formation and behavior. This isolated observation, of course, does not prove Bion's theory in any sense; however, it does support it.

One must be careful however not to assume that just because individuals are agreeing or disagreeing with some manifestly specific point of view that they are doing so for the same reasons. Bion provides a warning on this point:

Emotions associated with basic assumptions may be described by the usual terms, anxiety, fear, hate, love, and the like. But the emotions common to any basic assumption are subtly affected by each other as if they were held in a combination peculiar to the active basic assumption. That is to say, anxiety in the dependent group has a different quality from anxiety evident in the pairing group, and so on with other feelings.³⁰

Feelings and emotions are qualitatively modified according to the kind of "cement," in Bion's terms, which holds them together. Anxiety in the dependent group takes on a peculiar coloration because of the guilt and depression dominant in that emotional group; anxiety in the pairing group is influenced by the predominance of messianic hope; and anxiety in the fight-flight group is modified by feelings of anger, hate, and fearfulness which characterize that group. It is an interesting but not so revealing fact that all five factors expressed a feeling of relief at McCarthy's political appearance. The real explanation of the phenomena underlying the existence of these factors however goes beyond any manifest evidence of anxiety into the sources and dynamics of these various anxieties. While anxiety may be a verifiable fact for each of the emotionality groups, the primary problem of explanation, as Sartre would say, is not to treat the mere fact, but to suggest its *signification*.³¹

Bion states that anxieties underlie the various basic assumptions of dependence, pairing, and fight-flight. In the pairing group, to provide an illustration, anxiety on the part of an individual may compel him to seek allies—ally-seeking as a

³⁰ Bion, *op. cit.*, pp. 154-155.

³¹ Jean-Paul Sartre, *Sketch for a Theory of the Emotions*, trans. by P. Mairet (London: Methuen, 1962), pp. 26-27.

defense against anxiety—which manifests itself in the form of pairing behavior. When questioned about his overt behavior however, the individual may provide statements with the kind of sexually-symbolic content noticed by Bion and given a certain degree of confirmation in this study. But Bion suggests that such “sexual explanations” of pairing behavior may be only *rationalizations*—i.e., the anxiety exists and creates a drive which is relieved through a strategy of ally-seeking (pairing), and while the individual gives a plausible accounting for his immediate behavior, the real reason for the behavior lies elsewhere. As Ezriel was able to see (footnote 10), immediate behavior may be used deceptively—including self-deception—to avoid confronting reality.

How similar these dynamics are to those described by Lasswell in his developmental formula for political man,³² namely, *Political Man* = $p \} d \} r$, where p represents the private motive (the source of anxiety), d represents the displacement of affect into the public arena (through projection), and r represents the rationalization of the resulting behavior in terms of a broader interest (e.g., the future well-being of the country, returning the Democratic party to “the people,” making the Presidency more respectable, etc.). $\}$ means “transformed into.” So long as the respondent keeps the conversation focussed on whatever is represented by r , there will be no examination of the less-defensible p . This is not a conscious deception, however, as indicated by d .

The function expressed by Lasswell's d in Bion's schema is based on a concept discussed in an earlier paper by Melanie Klein³³ wherein the leader is incorporated into the group to the extent that he is seen to be compatible with the group's basic assumption. The leader does not create the group through manipulation of his special organization skills; he is the recipient of individually-projected desires and characteristics with which the follower in turn identifies in a subtle process of *projective identification*.

Under different titles, the Kleinian concept of projective identification has been noticed in various realms of human endeavor. In theology, for example, Feuerbach made note of the uniquely

human capacity for putting oneself in another's place, and he therefore was able to account for the image of the Deity as a projection of the individual's highest feelings of self: “God, as he is an object of religious sentiment, is nothing else than a product of the imagination.”³⁴ Such projections appear to obtain an independent status, and the individual identifies with his projections as if they were separate from him, providing the essentials for alienation. The varying projections are dependent upon the human condition which in turn depends on the existing social relationships, as Marx intimated. For Feuerbach, the sublimity of the religious vision was in inverse relation to the hopelessness of the human situation: The more abject the situation, the more glorious the vision.³⁵

Other patterns of behavior discussed elsewhere in the social sciences are also related to this dynamic. In the present study, for example, McCarthy can be regarded in psycho-linguistic terms as a *key symbol*, the presence of which provides a cue for those whose perspectives were similarly standardized during the formative stages of individual development.³⁶ For example, those persons reared under the influence of contingencies supportive of dependency behavior will develop similar perspectives; therefore, McCarthy becomes a unifying experience for them since what he symbolizes is common to all their experiences.

But going further, McCarthy's symbolic comprehensiveness was apparently sufficient for him to serve as key symbol for persons with differing

³⁴Ludwig Feuerbach, *The Essence of Christianity*, trans. by George Eliot (New York: Harper Torchbooks, 1957), p. 317.

³⁵See J. L. Talmon, *Political Messianism* (New York: Praeger, 1960), p. 209. As a propositional matter, Klein (*op. cit.*, pp. 303-304) postulates just the reverse, i.e., that there is a direct rather than inverse relationship between the projection and the individual's situation: “For instance, the projection of a predominantly hostile inner world which is ruled by persecutory fears leads to the introjection—a taking back—of a hostile external world; and *vice versa*, the introjection of a distorted and hostile external world reinforces the projection of a hostile inner world.” The relationship of such dynamics to alienation are discussed in a symposium, “Alienation and the Search for Identity,” *American Journal of Psychoanalysis*, 21 (1961), entire issue.

³³Melanie Klein, “Notes on Some Schizoid Mechanisms,” in Melanie Klein, Paula Heimann, Susan Isaacs, and Joan Riviere (eds.), *Developments in Psycho-Analysis* (London: Hogarth Press, 1952), pp. 292-320. (Originally published: *International Journal of Psycho-Analysis*, 27 (1946), 99-110.)

patterned preferences and, as such, he fell into the category of what Edelman calls a *condensation symbol*—the recipient of diverse and simultaneous projections.³⁷ At this point the phenomenon becomes truly multiplex as persons with diverse perspectives resonate to the same stimulus object (McCarthy), but for different reasons as developed through different experiences. The ambiguity of the object, coupled with its remoteness, provides a target for what Blumer has chosen to call *convergent selectivity*,³⁸ a process by which members of a mass converge on a common object because of an idiosyncratic attraction by each of them to selected characteristics of the object. Their common convergence produces the impression of homogeneous mass behavior—previously mistaken for a herd instinct—with the further, but erroneous, assumption of homogeneous motivation.

What is suggested here, however, is that the homogeneous flocking to McCarthy really had its roots in enduring but heterogeneous motivations, and that the link between the motivations and common overt behavior is bridged by Klein's notion of projective identification. The physical remoteness of McCarthy from most of his followers provided a gap which was spanned by individual projection onto him of characteristics the individual wanted or needed to find in a leader, wants and needs being contingent on previous interpersonal relations.³⁹

³⁷ Murray Edelman, *The Symbolic Uses of Politics*, Illini Books (Urbana: University of Illinois Press, 1967), pp. 6-7.

³⁸ Herbert Blumer, "The Crowd, the Public, and the Mass," in Wilbur Schramm (ed.), *The Process and Effects of Mass Communication* (Urbana: University of Illinois Press, 1954), pp. 363-379.

³⁹ As a symbol, McCarthy represented something or somebody many of his followers had experienced before in their separate life spaces. As Laing states, "behavior is a function of experience; and both experience and behavior are always in relation to someone or something other than self." See R. D. Laing, *The Politics of Experience* (New York: Pantheon Books, 1967), pp. 9-10. The concept of projective identification has been used retrospectively to account for the facts, and this is apt to bother some investigators concerned with confirmation. The concept need not remain this inferential, however, but can be put to test. In the context of the present study, for example, statements could be obtained relative to presumed characteristics of McCarthy's character: (1) a kind person; (2) warm and friendly; (3) dependable and conscientious; (4) wary of other politicians; (5) distrustful of our present policies and policy-makers; (6) cautious of attempts to trick or ensnare him; and so forth. A sample of,

But if all five factors in this study have a tendency to express relief at McCarthy's having entered the political race, factor 2 (pairing) seems least inclined from an examination of the normalized factor scores for statement 42 (Table 5). While this relative lack of anxiety is not statistically significant, it is still in keeping with findings reported elsewhere. According to Josephine Klein, for example, the emotional group cultures are in a kind of hierarchy based on progressive security, with the dependent group least secure and the work group most secure. Somewhere between the two extremes is the pairing group. Being more secure than the other two major emotional groups, members of the pairing group are more opposed to withdrawal (flight), a phenomenon observed as well by Stock and Thelen.⁴⁰ All of this suggests a developing sense of self-efficacy on the part of the pairing individual, and although his gregarious and social orientation toward the McCarthy movement might be considered superficial by the more "serious" and dedicated of the McCarthy followers, still it is only factor 2 apparently who emerges from the political fray with a strong positive self-regard and a feeling of having accomplished something. (See Table 6.)

Experiences during the campaign differed, of course: The noncompromising attitudes of fact—say, 40-some attribute-statements could be presented to respondents, such as those in the above study, who would then be asked to rank the items from "most like what I think McCarthy is like" to "most unlike what I think McCarthy is like." If, as Bion suspects, the dependent person seeks out a father-figure type of leader, then factor-1 persons will give high scores to items like 1-3 above, reflecting their *projection* onto McCarthy of father-figure characteristics (kind, warm, dependable, and so on). The important matter, of course, is that McCarthy objectively might be none of these. The private motives of the fight-oriented individual leads to a need for a leader with paranoid tendencies and a consequent projection onto McCarthy of these kinds of traits. This is reflected instrumentally by the giving of high scores to statements like 4-6 above, indicating McCarthy to be wary, distrustful, cautious, etc. The differential rankings could then be correlated and factored as before, different factors indicating differing perceptions of the same stimulus object. The concept of projective identification then can be held constant for steady inspection in terms of factor loadings and factor scores, all subject to standard error formulae and statistical evaluation.

TABLE 6.—PERCEPTION OF INFLUENCE
IN THE MOVEMENT

Statement no. 20	Factor Scores				
	1	2	3	4	5
I really feel as though I played an active, influential role in the McCarthy movement—at least as far as one individual could.	-5	4	-3	1	-3

tors 3 and 5, however, almost precluded a psychological win except under conditions of total victory. And one must keep in mind the tendency on the part of the pairing factor 2 to rationalize for the pleasantries of the pairing attitude, which might help account for the high score given by this factor to statement 20. But aside from these possibilities, by their own report factors 3 (fight) and 5 (despair) fare very poorly as far as feelings of influence are concerned; dependent factor 1 feels least influential of all; pairing factor 2 feels very influential. Counterdependent factor 4 never placed its self-esteem on the line in the first place and so had nothing to lose.

V. SUMMARY AND IMPLICATIONS

What has been illustrated manifestly is that the McCarthy movement of 1968 was not homogeneous and that the perceptions of those involved differed. This much is factual as expressed in factor-analytic terms.⁴¹ Explanation

"The genuineness of the phenomenon in a technical sense is supported by a replication study by Professor Brij B. Khare (California State College, San Bernardino) who with only 14 respondents and the same McCarthy Q sample has shown some of the same responses (factors) emerge again. This tends to substantiate this small-sample approach, and we are grateful to Professor Khare for his assistance. No claim, of course, can be made on the basis of a study like this regarding the percentage of this or that factor type, but the inclusion of another 1000 respondents will do little more than fill up the factor space and, perhaps, add another factor or two. However, additional factors would in no way detract from the ones we have found. This study was designed to illustrate the different ways in which the McCarthy audience was segmented, and this can be done without recourse to large numbers of cases. See S. R. Brown, *Small-Sample Behavioral Research: Procedures for Employing Q Technique in Political Science* (Kent, Ohio: Institute for Government Research and Service, Kent State University, 1970), in press.

of these differing perceptions reach into human subjectivities which are shown systematically to follow themes of group behavior suggested by Bion. Underlying all experiences is an assumption of individual tension manifested in common group action; the link between individual and group is explained in terms of projective identification, a concept encountered under various labels in psychoanalysis, linguistics, political science, theology, and sociology.

The pressures of modern society lead to various degrees of individual frustration and anxiety. Individuals, if they have anxieties, develop certain reactions to, as well as strategies for, dealing with those anxieties. And, as theory goes, individuals leave neither their anxieties nor their reaction patterns nor their strategies behind when they join groups, but bring these to the group situation. These reactions produce certain needs which the individual in concert with others in group context tries to satisfy. Bion has observed these individual-group interactions in small therapy sessions and has found them to vary about three major themes: dependency, pairing, and fight-flight. Our investigation of a political movement indicates these themes to be of more general applicability, as Bion intimated, with dynamics summarized as follows:

Dependence (factor 1). The reaction to anxiety is one of depression, and the need which develops is one for reassurance and sympathetic attention. The individual's strategy is to manipulate the group situation so as to produce a nurturant relationship. The group leader necessary for these purposes is a father-figure type, a person with an image of strength, stability, and capability for providing the needed reassurance. In a situation, as in this study, in which the leader is remote, the desired leadership traits are projected onto him.

Pairing (factor 2). The reaction to anxiety is one of a displacement in time, to a future time when the source of anxiety is in the past, and the need which develops is one for optimism and affiliation with other optimists to prevent a return in time. The leader is not present, his arrival representing that future event about which the group expresses its optimism and hopefulness. The leader is a conversation piece, and the group's hopeful anticipation makes it necessary that the leader be endowed (again through projection) with extraordinary characteristics, as if he were a genius or messiah. The greatness of the group leader and the selective affiliation of the group members provides an aristocratic aura to the group.

Fight (factor 3). The reaction to anxiety is one of anger and hate, and the need which develops is one for the expression of aggression and, consequently,

a need for a suitable target for that aggression. The individual's strategy is to manipulate the group into an aggressive force, and the most appropriate leader is one who sees the enemy most clearly, usually an individual with paranoid tendencies. McCarthy, being remote, has such tendencies projected onto him by individuals managing tension in this fashion.

Two minor themes also emerged in this study:

Counterdependence (factor 4). Members of this factor-type are not in conflict with the McCarthy phenomenon for they have at the time of this study rejected McCarthy. Being closest, by our interpretation, to Bion's work group, this factor reacts rationally, its needs are goal-determined, and as a consequence it identifies with a leader who is a realist. McCarthy is abandoned because he is perceived as being unrealistic.

Defeatist (factor 5). This factor is frustrated by events surrounding the 1968 Democratic Convention and is characterized by both depression (as in dependency) and anger (as in fight). This leads to both uncertainty and aggressiveness, and these cross-pressures lead to an apparent withdrawal.

The one theme suggested by Bion which did not emerge clearly was the basic assumption of flight. The following explanation would account for this absence: the flight-oriented individual's reaction to anxiety is fearfulness which leads to a need for escape. The leader-type facilitating such behavior would be epitomized by the alarmist, the person who would see at every turn a threat from which to flee—a worried paranoid as opposed to an angry one. McCarthy's calm exterior did not lend itself readily to these kinds of projections.

The results of this study justify closer attention to Bion's theory and speculation as to its broader implications. As Bion notes, it is important to understand emotional behavior for it can influence a group's attempt to accomplish a rational task. When group members actually try to act on a basic assumption—thereby allowing the nonrational to obtrude and influence reality-based behavior—unwanted effects may result. Pairing behavior on an emotional level, for example, may be the most appropriate strategy for dealing with individual stress at a particular point in time; however, if the hallucinatory gratifications of pairing are allowed to govern reality-bound behavior, the work group may split apart. Pairing on an emotional level, if allowed to operate openly, may appear as schismatic behavior on the work level.

An actual example is provided by Ezriel who discusses an incident in therapy in which group members colluded on an emotional level to create a situation all deplored: patient X needed to

be the group's *central figure* at a time the group needed a leader whom it could attack; therefore, X satisfied his needs by offering himself as leader, and this satisfied the group's need for a target to attack. The emotional group then proceeded to render ineffectual the work group: members found themselves driven, by force—beyond their rational control, into wasting the entire therapeutic session.⁴² This not only illustrates how under certain conditions a person will offer himself as leader at the expense of unpopularity, but also how he may succeed in attaining that position despite sufficient opposition to defeat him.

One need not go far in politics to find examples of unconscious collusion. Beradt, for example, shows that many of those subjugated in Nazi Germany voluntarily indulged in behavior which placed them under greater subjugation—i.e., they colluded with their oppressors in their own oppression, the reverse of their rational intentions.⁴³ Much of the liberal-conservative debate might be looked at in the same way: the right adheres to tradition (the group bible) and opposes developmental change whereas the left supports the new idea but, in the process, becomes so exacting in its demands as to cease recruiting itself. Therefore, schism and clash on an emotional level provide the illusion of group differences, whereas Bion suggests both groups may be colluding to avoid the painful synthesizing of old and new which is the essence of developmental conflict.⁴⁴

⁴² Ezriel, *op. cit.*, p. 125. The idea of a central figure was first put forward by Fritz Redl, "Group Emotions and Leadership," *Psychiatry*, 5 (1942), 573-596. (Reprinted: Robert Endleman (ed.), *Personality and Social Life* (New York: Random House, 1967), pp. 527-537.)

⁴³ Charlotte Beradt, *The Third Reich of Dreams*, trans. by Adriane Gottwald (Chicago: Quadrangle Books, 1966). See also the discussion of "transpersonal system of collusion" by R. D. Laing, *The Politics of the Family* (Toronto: CBC Publications, 1969), p. 29.

⁴⁴ Bion, *op. cit.*, p. 159. Since absence of developmental process is a characteristic of the basic-assumption mentality, much interesting research could proceed by assuming from the outset that both left and right, despite what they say, are committed to no change, and then looking for the subtle ways in which this is accomplished. It is not infrequently the case that on the eve of victory, radicals make new demands which render impossible a settlement or perform acts which cause them to lose the very support necessary for the legitimate majority for which they verbally appeal.

Bion's observation that groups can switch emotional strategies as a defense against threat also has implications. Insanity used to be regarded as a kind of meaningless behavior indulged in by persons who had "gone over the edge." More recently, it has been recognized that "insanity" is a lawful and systematic game played by persons who have not been able to win by sticking to the rules of "normality," a kind of purposive behavior whereby a person plays at being insane in order to avoid (flight) having his actions judged by rational criteria. One wonders somberly if some of the more extreme forms of "socio-political insanity" we witness daily are not also playful, in this sense, and governed by motivations analogous to the desire to avoid evaluation by rational criteria. This is not a criticism of the lunatic, for there may be good reasons for his acting crazy. But that his insanity is a kind of game, under the joint control of the actor and certain environmental contingencies, and not a mental illness in any physiological sense, is becoming clearer. Likewise, recognition of the non-rational basis of rioting, burning, and other "socio-political insanities" is not to be mistaken for criticism, for economic and social conditions may make such behavior patterns inevitable.⁴⁵

⁴⁵ See Thomas S. Szasz, *The Myth of Mental Illness: Foundations of a Theory of Personal Conduct* (New York: Harper and Row, 1961). Even lunatics begin to quit acting insane, apparently of their own volition, when given the power and respect denied them in the game of reality. Playing normal is therefore to some extent contingent upon power and respect which reinforce a particular behavior pattern. Evidence of this is to be found in Robert Rubenstein and Harold D. Lasswell, *The Sharing of Power in a Psychiatric Hospital* (New Haven, Conn.: Yale University Press, 1966), and Rubenstein, "The Study of Political Processes in Psychiatric Illness and Treatment," in Arnold A. Rogow (ed.), *Politics, Personality, and Social Science in the Twentieth Century: Essays in Honor of Harold D. Lasswell*

However, the political scientist, as is the case with the psychiatrist, must exercise care when dealing with the actors he is studying, for since they are members of both a work and emotional group, it is not always obvious whether their verbalizations are an accurate description of the phenomenon or merely another manifestation of it.

So in conclusion, we would again emphasize the importance of subjectivity in a complete theory of political action. Rogow recently has suggested that the relationship between psychiatry and political science is like one "of those long engagements that somehow never eventuate in marriage."⁴⁶ Although the two disciplines are no closer to marriage now than they ever were, they still have an active interest in one another. No one has ever seriously denied the importance to political theory of the emotional ingredient in which the psychiatrists have always been interested. In the past, such matters have been neglected largely for lack of developed theory (which tells us where to look) and lack of techniques able to capture the dynamic aspects which inevitably accompany emotional behavior. As a consequence, most such available theories, such as Bion's, are nonpolitical and most techniques are insensitive to subjective behavior. The study reported here admittedly is a long way from untangling the vexing problems of political-group emotionality, but we hope that it has served to indicate how one might go about beginning an investigation of such matters.

THE MEANINGS OF BLACK POWER: A COMPARISON OF WHITE AND BLACK INTERPRETATIONS OF A POLITICAL SLOGAN*

JOEL D. ABERBACH AND JACK L. WALKER

The University of Michigan

I. INTRODUCTION

Angry protests against racial discrimination were a prominent part of American public life during the 1960's. The decade opened with the sit-ins and freedom rides, continued through Birmingham, Selma, and the March on Washington, and closed with protests in hundreds of American cities, often punctuated by rioting and violence. During this troubled decade the rhetoric of protest became increasingly demanding, blanket charges of pervasive white racism and hostility were more common, and some blacks began to actively discourage whites from participating either in protest demonstrations or civil rights organizations. Nothing better symbolized the changing mood and style of black protest in America than recent changes in the movement's dominant symbols. Demonstrators who once shouted "freedom" as their rallying cry now were shouting "black power"—a much more provocative, challenging slogan.

The larger and more diverse a political movement's constituency, the more vague and imprecise its unifying symbols and rallying cries are likely to be. A slogan like black power has no sharply defined meaning; it may excite many different emotions and may motivate individuals to express their loyalty or take action for almost contradictory reasons. As soon as Adam Clayton Powell and Stokely Carmichael began to use the phrase in 1966 it set off an acrimonious debate among black leaders over its true meaning. Initially it was a blunt and threatening battle cry meant to symbolize a break with the past tactics of the civil rights movement. As Stokely Carmichael put it in one of his early speeches:

The only way we gonna stop the white men from whippin' us is to take over. . .

*Thanks are due to the National Institute of Mental Health for the grant which made this study possible; to James D. Chesney, Katherine S. Luken, Douglas B. Neal and all our associates at the Institute of Public Policy Studies who assisted in the analysis of the data; to the coding section of the Survey Research Center for their exceptional patience and industry; and to our colleagues Ronald D. Brunner, Philip E. Converse, Steven L. Coombs, Robert D. Putnam and Herbert F. Weisberg who commented upon earlier versions of this paper.

We've been saying freedom for six years and we ain't got nothing'. What we gonna start saying now is black power, . . . from now on when they ask you what you want, you know to tell them: black power, black power, black power!'

Speeches of this kind not only were a challenge to the white community; they also were attacks on the currently established black civil rights leaders, especially those who had employed more accommodating appeals or had used conventional political and legal channels to carry on their struggle. Carmichael's speeches brought a swift, negative response from Roy Wilkins:

No matter how endlessly they try to explain it, the term black power means anti-white power . . . It has to mean going it alone. It has to mean separatism. Now separatism . . . offers a disadvantaged minority little except a chance to shrivel and die. . . . It is a reverse Mississippi, a reverse Hitler, a reverse Ku Klux Klan. . . . We of the NAACP will have none of this. We have fought it too long.²

Although not so adamant and uncompromising as Wilkins, Martin Luther King expressed the doubts of many moderate leaders when he said:

It's absolutely necessary for the Negro to gain power, but the term "black power" is unfortunate because it tends to give the impression of black nationalism. . . . We must never seek power exclusively for the Negro, but the sharing of power with the white people. Any other course is exchanging one form of tyranny for another. Black supremacy would be equally evil as white supremacy. My problem with SNCC is not their militancy. I think you can be militantly non-violent. It's what I see as a pattern of violence emerging and their use of the cry "black power," which whether they mean it or not, falls on the ear as racism in reverse.³

This disagreement over the implications of the black power slogan was caused partly by a clash:

¹ William J. Brink and Louis Harris, *Black and White* (New York: Simon and Schuster, 1966), p. 50.

² *New York Times*, July 6, 1966, p. 14.

³ *Ibid*, July 6, 1966, p. 15, and July 9, 1966, p. 8.

of personalities and ambitions, but it was also the result of fundamental differences over the proper role of a black minority in a society dominated by white men. Should the ultimate goal be complete assimilation and the development of an essentially "color blind" society, or should blacks strive to build a cohesive, autonomous community, unified along racial lines, which would be in a stronger position to demand concessions and basic social changes from the whites? For American Negroes, who bear the brutal legacy of slavery and are cut off from their African heritage, this is a terribly difficult choice. As James Baldwin said when he compared himself with the lonely, poverty-stricken African students he met in Paris: "The African . . . has endured privation, injustice, medieval cruelty; but the African has not yet endured the utter alienation of himself from his people and his past. His mother did not sing 'Sometimes I Feel Like a Motherless Child,' and he has not, all his life long, ached for acceptance in a culture which pronounced straight hair and white skin the only acceptable beauty."⁴ The slogan black power raises all the agonizing dilemmas of personal and national identity which have plagued black Americans since the end of slavery; the current dispute over its meaning is echoed in the speeches of Frederick Douglass, Booker T. Washington, W. E. B. DuBois, and Marcus Garvey.

Those, like Harold Cruse,⁵ interested in a comprehensive social theory to guide black development in the United States are not particularly impressed with the term black power because:

it is open to just as many diverse and conflicting interpretations [as the former abstractions Justice and Liberation]. While it tries to give more clarity to what forms Freedom will assume in America as the end-product of a new program, the Black Power dialogue does not close the conceptual gap between shadow and substance any more than it plots a course for the program dynamic.⁶

Cruse hopes for the development of a synthetic political ideology in the classic sense

⁴ James Baldwin *Notes of a Native Son* (Boston: Little, Brown, 1955), p. 122.

⁵ Cruse, for example, in his provocative series of essays, *The Crisis of the Negro Intellectual* (New York: William Morrow, 1967), p. 557, says that "the radical wing of the Negro movement in America sorely needs a social theory based on the living ingredients of Afro-American history. Without such a theory all talk of Black Power is meaningless."

⁶ *Ibid.*, p. 545.

which brings together economic, cultural and political factors; black power, at this point in time, is a label for a series of ideas which fall far short of this goal.

Whatever interpretation may be given it, black power is a provocative slogan which causes excitement and elicits strong responses from people. Even though, as Charles Hamilton says, "in this highly charged atmosphere it is virtually impossible to come up with a single definition satisfactory to all,"⁷ the definition an individual selects may tell us a great deal about how he defines himself politically in a society torn by racial strife. His definition is a way for him to bring together his views on leaders and events in the environment. If he agrees with Stokely Carmichael and Charles Hamilton, he sees black power as "a call for black people in this country to unite, to recognize their heritage, to build a sense of community."⁸ He may also see it as a call for anything from "premeditated acts of violence to destroy the political and economic institutions of this country" to "the use of pressure-group tactics in the accepted tradition of the American political process."⁹

We know that community leaders have strong reactions to the black power slogan, but little is known of its impact on ordinary citizens, both black and white. As we shall demonstrate, for the white citizen the slogan usually provokes images of black domination or contemporary unrest which he cannot understand or tolerate. For the black citizen, it is more likely to raise subtle issues of tactics and emphasis in the racial struggle. In this essay we will examine how blacks and whites in a large urban center define black power, why they define it as they do, and whether their view of the slogan is part of a coherent set of interpretations and evaluations, a racial ideology, which they used to define the role of blacks as political and social actors in our society.

⁷ Charles Hamilton, "An Advocate of Black Power Defines It," *New York Times Magazine*, April 14, 1968, pp. 22-23, 79-83, reprinted in full in Robert L. Scott and Wayne Brockriede, eds., *The Rhetoric of Black Power* (New York: Harper and Row, 1969), pp. 178-194. This statement is found on p. 179.

II. THE DATA

Our analysis is based on data gathered in a survey of Detroit, Michigan, completed in the fall of 1967. A total of 855 respondents were interviewed (394 whites and 461 blacks). In all cases whites were interviewed by whites, blacks by blacks. The total N came from a community random sample of 539 (344 whites and 195 blacks) and a special random supplement of 316 (50 whites and 266 blacks) drawn from the areas where rioting took place in July, 1967.¹⁰ Since there are few meaningful differences between the distributions or the relationships of interest in the random and riot-supplement samples, we have employed the total N in the analysis so that a larger number of cases are available when controls are instituted.

III. A PROFILE OF COMMUNITY OPINION

Since there is such confusion and uncertainty over the meaning of black power among the writers, spokesmen and political leaders of both races, we might wonder if the slogan has had any impact at all on average citizens. The first questions we must ask are simply: do our respondents recognize the term, have they formed an elaborate reaction to it, and if so, what meaning do they give it?

Because of the lack of consensus among community leaders about the precise meaning of black power or even agreement on a common framework for discussing the slogan, we were reluctant to use a close-ended question to capture our respondents' interpretations of the term. In order to avoid the danger of biasing responses or eliciting a random choice we used a simple, open-ended question: "What do the words 'black power' mean to you?" This has the advantage of permitting people to speak with a minimum of clues, but it also has disadvantages which we recognized. Respondents may not have given the term a great deal of thought and their answers may be unreliable indicators of their opinion (or lack of opinion). Use of the vernacular at times inhibited interpretation of the answers.¹¹ It was sometimes difficult to judge whether a respondent was sympathetic or unsympathetic to black power as he interpreted it. For example, a small number of Negro respondents (N = 3) could only define black power as "rebellion." We can guess their feelings about this word from the context of the interview, but this carries us a step away from their answers.

¹⁰ Riot areas were defined by a location map of fires considered riot-related by the Detroit Fire Department.

¹¹ See our discussion below of "nothing" as a response.

Fortunately, the answers were generally quite comprehensible and when we asked the same open-ended question of a subsample of the original respondents one year later (1968) we received answers consistent with their first response from a majority of the people.¹² In addition, in 1968 we supplemented the question on the meaning of black power with a close-ended item: "Do you approve or disapprove of 'black power'?" This provided a means of checking the criteria we developed in 1967 from the open-ended question for deciding whether respondents had a favorable or unfavorable view of the black power slogan. The correlation between our scoring as favorable or unfavorable of the 1968 respondents' interpretations of black power on the open-ended question and their own assessment, on the close-ended question, of their position was (Gamma) .99 for blacks and .97 for whites.¹³

Table 1 presents a simple profile of Detroit community responses to our question on black power. As noted above, since there were no appreciable differences for either race in the interpretations given by respondents in the riot or non-riot areas, we have included all our respondents in the analysis.¹⁴

Interpretations indicating a favorable or unfavorable attitude toward black power are

¹² The correlation between interpretations of black power on the open-ended question in 1967 and interpretations in 1968 is (Gamma) .54 for blacks and .78 for whites. We will be gathering data from the same respondents once again in September, 1970, and will report our findings in detail after the third round is completed.

¹³ We will present our codings below. A more conservative coefficient for demonstrating the relationship between interpretations of black power on the open-ended question and approval or disapproval on the close-ended question would be Kendall's tau-beta. See Leo A. Goodman and William H. Kruskal, "Measures of Association for Cross Classification," *Journal of the American Statistical Association* (December, 1954). The tau-beta correlations are .86 for blacks and .60 for whites. The lower coefficient in the white case reflects the relatively large percentage of whites who give favorable interpretations of black power but disapprove of the slogan. This will be discussed in more detail in the text.

¹⁴ For the blacks, the riot area respondents gave a greater emphasis to black unity as opposed to fair share interpretations of black power, but the differences are not great. Non-riot area respondents actually were slightly more favorable to black power if we consider unity and fair share responses as indicators of positive feelings.

TABLE 1.—BLACK POWER INTERPRETATIONS,
BY RACE

(Question: What do the words "black power" mean to you?)		
Interpretation	Blacks	Whites
Unfavorable		
Blacks Rule Whites	8.5%	38.6%
Racism	3.9	7.3
Trouble, Rioting, Civil Disorder	4.1	11.9
"Nothing"	22.3	5.3
Negative Imprecise Comments (ridicule, obscenity, abhorrence)	6.5	11.7
Other*	4.3	5.9
	49.6	80.7
Favorable		
Fair Share for Black People	19.6	5.1
Racial (Black) Unity	22.6	5.6
	42.2	10.7
Don't Know, Can't Say		
	8.2	8.6
	100%	100%
	(N = 461)	(N = 394)

* "Other" responses were scattered and inconsistent, although generally negative. They include references to black power as communism, radicalism, a return to segregation and a sophisticated failure to define the concept because of a perception that it has contradictory meanings. The latter answer was given by one black and five white respondents.

marked off for the convenience of the reader. As we go through the various categories the reasons for our designations will be explained in detail.

Almost 40 percent of the whites believe black power means black rule over whites, while only 9 percent of the black respondents hold this view. This attitude of the whites is clearly *not* a function of a rational projection that the increasing black population in the city of Detroit (now about 40 percent) will soon elect a black mayor, but is an almost hysterical response to the symbolism of the slogan. White people in this category usually refer to blacks taking over the entire country or even the world.¹⁵

¹⁵ The quotes presented here are typical examples of black power definitions coded in each

(white, male, 47, 12 grades) Nasty word! That the blacks won't be satisfied until they get complete control of our country by force if necessary.

(white, male, 24, 12 grades plus) Black takeover—Take over the world because that is what they want to do and they will. There's no doubt about it. Why should they care? I'm working and supporting their kids. In time they'll take over—look at how many there are in Congress. It's there—when they get to voting age, we'll be discriminated upon.

(white, female, 28, 12 grades plus) The colored are going to take over and be our leaders and we're to be their servants. Yes, that's exactly what it means.

(white, female, 28, 12 grades) They want the situation reversed. They want to rule everything.

(white, male, 32, 11 grades) The Negro wants to enslave the white man like he was enslaved 100 years ago. They want to take everything away from us. There will be no middle class, no advancement. He is saying, "If I can't have it neither can you." Everything will be taken away from us. We'll all be poor.

(white, female, 40, 12 grades) I don't like the sound of it. Sounds like something coming to take you over.

Most of our black respondents *do not* interpret black power in this way. Blacks who were coded in this category were usually also hostile to black power. For example:

(black, male, 28, 12 grades plus) It means dominating black rule—to dominate, to rule over like Hitlerism.

(black, female, 38, 11 grades plus) It means something I don't like. It means like white power is now—taking over completely.

(black, male, 29, no answer on education) It means to me that Negroes are trying to take over and don't know how.

A few others gave this answer because they have very vague ideas about the concept:

(black, female, 50, 9 grades) Sounds like they want to take over control.

category. Respondents are identified by race, sex, age and educational attainment for the benefit of the reader. In cases where the respondent has some specialized training, he is coded with a "plus" after his grade level.

There were only seven people in this group of 37 blacks who saw black domination over whites as the definition of black power and whose answers could possibly be interpreted as approval of this goal.

A small number of whites and blacks simply defined black power as racism or race hatred. The comments of blacks holding this view were especially scathing:

(black, female, 57, 11 grades) It's like the Ku Klux Klan and I don't like it.

(black, female, 38, 12 grades) It means something very detrimental to the race as a whole. This is the same tactic the whites use in discriminating.

The black power definitions of about 12 percent of the white population and 4 percent of the blacks sampled were directly influenced by the violence of the 1967 Detroit disorders. Terms like "trouble" and "rioting" were commonly used by these individuals, especially blacks in the riot areas and whites outside of it. Clearly, however, the vast majority of black people sampled do not see black power as a synonym for violence and destruction, racism or even black rule over whites, while 57.2 percent of the whites do.

Two views of black power predominate among our black respondents. One represents a poorly articulated negativism or opposition to the term and the other a positive or approving interpretation of the concept and its meaning. Roughly 23 percent of the black respondents indicated that the term meant "nothing" to them. This category was coded separately from the "Don't Know," "Can't Say," and "No Answer" responses because the word "nothing" is generally used as a term of derision, especially in the black community. Some examples of extended responses give the proper flavor:

(black female, 39, 10 grades) Nothing! (Interviewer probe) Not a damn thing. (further probe) Well, it's just a word used by people from the hate school so it don't mean nothing to me.

(black, male, 52, 12 grades plus) It means nothing! (probe) A word coined by some nut. (further probe) There is only one power and that is God.

(black, female, 60, 5 grades) It doesn't mean nothing. (probe) Biggest joke in the 20th century.

It is, of course, possible that some people use "nothing" as a synonym for "I don't know." We have two major pieces of evidence which indicate that this is not so for the major proportion of blacks giving the response: (1) while direct expressions of ignorance ("don't know," "can't

say," etc.) are a function of educational level, "nothing" is used in the same proportion by blacks no matter what their academic accomplishments; (2) blacks use the expression more than four times as often as whites (22 percent to 5 percent) in trying to express what black power means to them; and (3) almost 90 percent of the respondents who interpreted black power in this way in 1968 also expressed disapproval of the term on our close-ended question.¹⁶

There are other individuals who give less ambiguous, clearly negative interpretations of the term. A small proportion of our respondents (1.3 percent of the blacks and 0.7 percent of the whites) found profanity indispensable as the sole expression of their definition. Others (5.2 percent of the blacks and 11.0 percent of the whites) were slightly more articulate in their condemnation, although their definitions were still imprecise. Often, especially for the whites, they reflect a general abhorrence of power in any form:

(white, female, 52, 12 grades) I hate the expression because I don't like power. It's very domineering and possessive and (they) have only themselves in mind.

(white, male, 54, 4 grades) No more than the words white power mean. They should cut that word out.

(black, female, 37, 9 grades) Black power and white power means the same to me which is no good. Man should be treated as a man.

(white, female, 55, 12 grades) Disaster! You know what you can do with your black power.

(white, female, 53, 12 grades) Scare! Why should there be black power any more than white power? Don't the blacks agree that all races are equal?

The last remaining major category of answers clearly distinguishes the black from the white community in its views of black power. In their statements 42.2 percent of our black respondents as compared to 10.7 percent of the whites emphasized a "fair share for black people" or "black unity." We coded all those answers which stressed blacks getting their share of the honors and fruits of production in society, exercising equal rights, bettering their living conditions or gaining greater political power into our "fair share" categories. Definitions stressing black

¹⁶ All of the few whites who interpreted black power as "nothing" in 1968 were negative about the slogan.

unity or racial pride were coded separately.¹⁷ Since only 7 blacks and 2 whites mentioned racial pride specifically, we will refer in the text to "black unity" or "racial unity" only. We felt that a definition of black power in terms of black people gaining political power in areas where blacks are in the majority fell under our fair share concept, but there were only two statements of this type. This definition may be implicit in the statements made (or in some of our black unity interpretations), but virtually all references are to justice and equity rather than exclusive control of a geographical area.

Fair share answers were given by almost twenty percent of our black respondents. People whose responses fall into this category see the black power slogan as another statement of traditional Negro goals of freedom, equality and opportunity. Respondents often take pains to reject notions of blacks taking advantage of others:

(black female, 47, 12 grades plus) That we should have blacks represent us in government—not take over, but represent us.

(black, male, 40, 9 grades plus) Negroes getting the same opportunities as whites when qualified.

(black, male, 24, 12 grades) Negroes should get more power to do the same things which whites do.

(black, female, 52, 12 grades plus) Give us an equal chance.

(black, male, 41, 0 grades) To me it means an open door into integration.

(black male, 39, 12 grades) Equal rights to any human being.

(black, female, 54, 7 grades) That America is going to have a new power structure so black people can have a share.

(black, male, 23, 10 grades) Getting in possession of something—like jobs and security.

(black, male, 55, 12 grades) It means equal opportunities for both races. What's good for one is good for the other.

About 23 percent of our black respondents gave "black unity" responses.¹⁸ These were

¹⁷ In a few cases (N = 20) respondents stressed black unity in order to achieve a fair share. We are considering first mentions here and in our analysis, but will probe this in detail when we have more time.

¹⁸ We will combine black unity definitions with the few racial pride references for purposes of analysis.

more militant in tone than the fair share definitions, sometimes extremely nationalistic, but always (as in the fair share answers) concerned with bettering the situation of the black man and not putting down the white man. In fact, the data suggest to us that blacks who are most favorably disposed towards black power simply do not see the political world as one where blacks can gain something only at the expense of whites and vice versa. As we have seen, however, large numbers of whites do see things this way. For them one group or the other must tend to "take over."

The major difference between the "fair share" and "black unity" groups is that the former places heavy stress on blacks as equal participants in the total society, while the latter emphasizes black togetherness and achievement without the same attention to the traditional symbols of Negro advancement. We know from extended answers to our black power question and others that individuals giving black unity responses want equality and a just share of America's goods, but "thinking black" and speaking militantly and with pride are given primacy when talking about black power.¹⁹ It is not that they are against white people; they are simply for black people and deeply committed to the idea of black people working together:

(black, male, 35, 9 grades) People getting together to accomplish things for the group.

(black, male, 36, 12 grades plus) Negroes have never been together on anything. Now with the new movement we gain strength.

(black male, 24, 12 grades) We people getting together, agreeing on issues and attempting to reach a common goal.

(black, male, 28, 12 grades) Sounds frightening, but really is what whites, Jews, Arabs and people the world over do—divided we fall united we stand.

(black, female, 41, 12 grades plus) Togetherness among Negroes; but it means you can get along with others.

¹⁹ See footnote 17. About 20 percent of the black respondents mentioning racial unity saw it as a means of achieving equality. For example:

(black, male, 42, 12 grades) Negroes getting together and forcing whites to realize our importance—our worth to the United States. Gaining respect and equality.

The more articulate members of the black unity group are concerned with ends as well as means. See Carmichael and Hamilton, *op. cit.*, pp. 46-47.

(black, female, 37, 10 grades) It means being true to yourself and recognize yourself as a black American who can accomplish good things in life.

(black, female, 57, 10 grades) The white man separated us when he brought us here and we been that way ever since. We are just trying to do what everybody else has—stick together.

As we have noted, the number of whites giving either the fair share or black unity response is small—just over 10 percent of the white sample. To most whites, even those who think of themselves as liberals, the concept of black power is forbidding. The 1967 riot is certainly one factor that might account for this, but we found little evidence of it. Only 5 whites in the entire sample (one percent) gave answers like the following:

(white, female, 23 college) It's gotten (away) from the original meaning. Means violence to me now.

In addition, as we shall see, even whites who have very sympathetic views about the causes of the disturbances can hardly be described as favorable to black power. The negative presentations of black power in the mass media may be responsible, but Detroit Negroes are also attentive to the same media and their views are quite different. The evidence presented in Table 1 points strongly towards a simple conclusion—the overwhelming majority of whites are frightened and bewildered by the words black power. Some of this seems rooted in abhorrence of stark words like power, but the term *black power* is obviously intolerable. The words conjure up racial stereotypes and suspicions deeply ingrained in the minds of white Americans. The slogan presents an unmistakable challenge to the country's prevailing racial customs and social norms; for precisely this reason it seems exciting and attractive to many blacks.

In summary, the vast majority of white people are hostile to the notion of black power. The most common interpretation is that it symbolizes a black desire to take over the country, or somehow deprive the white man. Blacks, on the other hand, are almost evenly divided in their interpretations with 42.2 percent clearly favorable to black power and 49.6 percent defining it in an unfavorable way. Those blacks who are favorable to black power see it as another call for a fair share for blacks or as a rallying cry for black unity, while those who are negatively inclined tend to see it as empty and meaningless (our "nothing" category, for example). Blacks certainly do not interpret the term the way the whites do. They do not see it as meaning racism,

a general black takeover, or violence, and those few blacks who do define the term in this way are negative about such meanings. It is evident that "black power" is a potent slogan which arouses contradictory feelings in large numbers of people. Interpretations of the term may differ, but the slogan clearly stimulates intense feelings and may be exciting enough to move men to purposeful action.

Although these data invite many different forms of analysis, we have decided that an attempt to understand the sources of favorable reactions to the black power slogan is of primary importance. We have, accordingly, conducted a detailed investigation of factors which predispose an individual to give a "fair share" or "black unity" response to our question on the meaning of black power. In the case of blacks, we are confident that all such definitions indicate a favorable attitude and for whites we know that they usually represent a positive attitude and always indicate at least a grudging respect or admiration. Certainly, as indicated above, we will miss a few black people who are favorable to black power if we follow this procedure, but the number is very small. In most cases, in order to keep the tables and text from becoming inordinately complex, we will combine the fair share and black unity categories and speak of individuals favorably interpreting black power, but where differences between respondents giving these two answers are of great importance we will consider them separately.

IV. THE APPEAL OF BLACK POWER: SOCIAL CHANGE, SOCIALIZATION AND DEPRIVATION

Many social scientists in recent years have been struggling to understand the increasing militancy within the black community and the concurrent rise in popularity of slogans like black power. To date, most systematic social science research in this area has centered on the "conventional militancy" of the early 1960's²⁰ or

²⁰The best example of work in this area is Gary T. Marx, *Protest and Prejudice: A Study of Belief in the Black Community* (New York: Harper and Row, 1967). Marx defined "conventional militancy" by the standards of civil rights activists and organizations at the time of his study (1964). All were (pp. 40-41) "urgently aware of the extensiveness of discrimination faced by the American black man. All called for an end to discrimination and segregation and demanded the admission of the Negro to the economic and political mainstream of American life. And they wanted these changes quickly—'Freedom Now.' In pursuit of this end, participation in peaceful demonstrations was encouraged."

the backgrounds and attitudes of rioters and those who sympathize with them.²¹ The civil disturbances of the mid-1960's were clearly watershed in American racial history, but most scholars concentrating on the riots would agree that there is more to the current upheaval in the black community—symbolized by the slogan black power—than violence. Recent calls for racial pride, black unity and black self-esteem, and programs to promote these ends, are meant to reach members of the community and help them to become a constructive force in their own behalf.

This section is devoted to a discussion of the factors which predispose an individual to interpret black power favorably. The major emphasis in our analysis will be on our black respondents; but at times we will compare them to whites in order to highlight certain points. The relative lack of support for black power among white respondents prevents a more elaborate analysis of their views in this section stressing favorable versus unfavorable interpretations of the term.

It is probably best to begin by laying to rest the so-called "riffraff" theory, which has been the favorite target of many riot researchers, as a possible explanation for the appeal of the black power slogan. The riffraff theory, drawn from the report of the McCone Commission on

the Watts riots of 1964,²² holds that urban unrest is a product of a deprived underclass of recent unassimilated migrants to the cities. We will discuss the issue of migration below, but neither education (Gamma = $-.02$)²³ nor income (Gamma = $-.06$) nor occupation (Gamma = $.00$) is a very potent predictor of favorable interpretations of black power for blacks. For whites, on the other hand, education (Gamma = $.32$), income (Gamma = $.23$) and occupation (Gamma = $.48$) are associated with positive views of black power, but here it is the upper status elements who interpret the slogan favorably.²⁴ It is clear that any notion that black power appeals strictly to the less privileged in the black community is without foundation.

Some scholars, and many journalists and politicians, have adopted the clash between generations as a principal explanation of the growing popularity of the black power slogan.²⁵ The riots

²² *Violence in the City—An End or a Beginning? A Report by the Governor's Commission on the Los Angeles Riots* (Los Angeles: McCone Commission Report, 1965).

²³ In the calculations which follow, unless otherwise noted, the black power variable is dichotomized with a favorable interpretation ("fair share" or "racial unity") scored *one* and unfavorable interpretations scored *zero*. Respondents with "don't know" or "no answer" responses were not used in the analysis. In this association, for example, those with low educational achievement were slightly less likely to approve of black power (give the "fair share" or "racial unity" interpretations) than those with substantial educational achievement.

²⁴ We do not think that this is simply because their higher level of education makes them more aware of the content of the actual debate over black power. Relative youth, education, and support of integration are all intertwined and each of these factors is related to a favorable interpretation of black power.

²⁵ See Jerome H. Skolnick, *The Politics of Protest* (New York: Simon and Schuster, 1969), p. 162, and *The U. S. Riot Commission Report, op. cit.*, especially p. 93 where "a new mood among Negroes, particularly among the young" is described. "Self-esteem and enhanced racial pride are replacing apathy and submission to 'the system.' Moreover, Negro youth, who make up over half of the ghetto population, share the growing sense of alienation felt by many white youth in our country. Thus, their role in recent civil disorders reflects not only a shared sense of deprivation and victimization by white society but

²¹ Riot research is widespread. See, especially, David O. Sears and John B. McConahay, "Riot Participation," and Raymond J. Murphy and James M. Watson, "The Structure of Discontent: Grievance and Support for the Los Angeles Riot," *Los Angeles Riot Study* (Los Angeles: Institute of Government and Public Affairs, University of California, 1967); Nathan S. Caplan and Jefferey M. Paige, "A Study of Ghetto Rioters," *Scientific American* (August, 1968), pp. 15-21, also reported in the *Report of the National Advisory Commission on Civil Disorders (The U. S. Riot Commission Report)*. Washington: United States Government Printing Office, 1968); *Supplemental Studies for the National Advisory Commission on Civil Disorders* (Washington: U. S. Government Printing Office, 1968), especially Angus Campbell and Howard Schuman, *Racial Attitudes in Fifteen American Cities*, Chapters 5-6 and Robert M. Fogelson and Robert B. Hill, *Who Riots: A Study of Participation in the 1967 Riots*; and Louis H. Masotti and Don R. Bowen, eds., *Riots and Rebellion: Civil Violence in the Urban Community* (Beverly Hills: Sage Publications, 1968). Studies which emphasize aggregate data can be found in Ted R. Gurr and Hugh D. Davis, eds., *The History of Violence in America* (New York: Bantam Press, 1969).

in Detroit and Los Angeles are seen as only one manifestation of a worldwide revolt of youth against the established order. The young are said to be more impatient and less willing to accept marginal gains than their elders.

When we divided our respondents according to age, however, we did not find great differences over the interpretation of black power within either racial group, although age was a better predictor for whites ($\text{Gamma} = -.26$) than for blacks ($\text{Gamma} = -.11$). Among blacks, 51 percent of those in their twenties gave the racial unity or fair share interpretations, but almost the same percentage of thirty, forty and fifty-year-olds gave similar responses. Approval of black power drops off among sixty and seventy-year-old blacks, but they constitute a small percentage of our sample. As noted above, age is a better predictor for whites with individuals forty and older somewhat less likely to offer an approving interpretation of black power than those under forty.

A. Social Change and Socialization: Breaking the Traditional Mold

One might assume after examining this relationship that the much discussed "generation gap" is not very wide, especially in the black community. But that conclusion would be unwarranted. Differences among blacks exist, not between youth and age, but between those who grew up in Michigan and those who were born and grew up in the South. Blacks who were born in Michigan are much more likely to give the racial unity or fair share interpretation of black power than those born in the South ($\text{Gamma} = .33$).²⁶ When we related age and attitudes to-

also the rising incidence of disruptive conduct by a segment of American youth throughout the society."

²⁶ We have defined the South as the 11 states of the Confederacy ($N = 255$) and the border states of Kentucky, Maryland, Oklahoma, and West Virginia ($N = 49$). Blacks born in border states were actually less likely to interpret black power in fair share or black unity terms than those born in the former states of the Confederacy, although the differences are small. One hundred and seven of our black respondents were born in Michigan (coded *one*). This accounts for only 412 respondents. Of those remaining, 43 were born in the United States, but outside of Michigan and the South, 1 in Canada, 1 in the West Indies and 1 in Puerto Rico. We lack information on 3 individuals. The 43 respondents born in the U.S., but not in Michigan or in the South, come from a

** Percentages are not displayed if N is less than 5.

ward black power with regional background controlled (Table 2), we found that the background factors clearly predominated. Those in our sample who were born in Michigan are much younger, on the average, than the rest of our respondents (78 percent are under 40 years old and 98 percent are under 50), but definitions of black power are almost invariable for this group between age categories. There is also very little variance between age categories for those who were born in the South and came to Michigan after they were 21 years old, although, of course, there is much less approval for black power in this group. In both cases, it is regional background and not age which is the most powerful explanatory factor. Further confirmation of this conclusion comes when we examine those respondents who were born in the South, but arrived in Michigan before they were 21.

Within this group we find that the percentage of those voicing approval of black power actually *increases* along with age from the teens to the fifties, and then decreases again for the small number who are in their sixties.

wide variety of places. They are more favorably disposed toward black power than the Southerners but less so than the Michigan-born.

It might be thought that regional differences mask a more fundamental difference between blacks who were born in cities and those raised in rural areas. This is not the case. Thirty-nine percent of Southern-born Negroes who grew up on farms and in small towns favored black power; the percentage giving fair share or black unity interpretations is only 4.3 percent higher (43.3 percent) for respondents raised in the large Southern towns and cities (Gamma = .03).

This evidence leads us to conclude that, for all but the very old, it is primarily the experience of life in Michigan and not the respondent's age which helps determine his reaction to black power.²⁷ A great migration began during World War II which brought thousands of black workers to the auto plants and foundries of Detroit. Their children are coming of age in the 1960's. It is not their youth, however, which leads them to see black power as a call for racial unity or a fair share for their race; it is their experience with the culture of the urban North. It seems that the further one is from life in the South, and the sooner one experiences life in a city like Detroit, the more likely one is to approve of black power.

Life in the Northern city brings to bear on a black person forces which lead him to reject the traditional, subservient attitudes of Southern Negroes, particularly if these forces represent his major socializing experience. Away from the parochial, oppressive atmosphere of the South, he is born into or slowly appropriates the more cosmopolitan, secularized culture of the North. The new life in the promised lands of Detroit, New York and Chicago is exciting and disillusioning at the same time. It brings new hopes and the promise of a better life, and disappointments when achievements do not live up to expectations.

The Southern migrant arrived in the "promised land" to find bigotry, filth, and a more sophisticated form of degradation. With time, he grasps sufficient information about the urban

²⁷ Other bodies of data and our own show that almost all riot participants are young and that age does have an impact on favorable attitudes toward violence, especially for young men. This is not surprising in light of the physical attributes helpful to a participant in a disturbance and the bravado of the young. However, age is unrelated to more general notions of whether riots helped or hurt the black cause (Murphy and Watson, *op. cit.*, p. 82) as well as to attitudes toward black power. It is clear that age is an important variable in the study of our recent strife, but by itself it does not explain contemporary militancy or even sympathy for those who participate in civil disturbances.

paradise. Traditional attitudes of deference and political passivity fade as a militant social and political stance gains approval in the community.²⁸ This is the atmosphere for the emerging popularity of fair share and racial unity interpretations of slogans like black power.

Just as the trip North represented an attempt to find deliverance, so the Negro church was another traditional avenue of entry into the "promised land." Most blacks who break with the church are more likely to define black power in fair share or unity terms.²⁹ This relationship holds even with region controlled (Table 3). In

²⁸ See Samuel P. Huntington, *Political Order in Changing Societies* (New Haven: Yale University Press, 1968), pp. 280-283 for a discussion of the potential for "political radicalism" of second generation slumdweller. Claude Brown makes the same points in the graphic Foreword to his autobiography, *Manchild in the Promised Land* (New York: Macmillan, 1965). We will make some distinctions between the effects of dissatisfaction on lower and upper status groups in the section on deprivation below.

²⁹ The sample was divided into church (coded one), non-members (coded zero) and members of groups, usually action groups, connected with a church (not included in the analysis). People in the latter category (N = 25) chose to emphasize their group above their church affiliation in answering our open-ended question on membership in "church or church-connected groups." They were about as likely as the non-members to approve of black power and should be the subject of intensive study because of their pivotal position in the black community.

For a detailed discussion of the similar influence of religion on conventional militancy among blacks, including consideration of denomination and religiosity, see: Gary T. Marx, "Religion: Opiate or Inspiration of Civil Rights Militancy Among Negroes," *American Sociological Review* (1967), pp. 64-72.

fact, membership and place of birth exert an independent effect. Michigan-born church members are about mid-way between Southern-born church members and Southern non-members in their approval of black power. Retention of a church affiliation acts as a brake on the effects of being raised in the Northern urban environment. It represents a strong tie to the traditional Negro culture.³⁰

Another aspect of traditional Negro culture is the unique measure of esteem granted the federal government and its personnel. Through the years the federal government, for all its shortcomings, has been the black man's special friend in an otherwise hostile environment. It won him his freedom, gave him the best treatment he received in his worst days in the South, provided relief in the Depression and in the difficult periods which have followed, and has done the most to secure his rights and protect him during his struggle for equality.³¹ In addition, it has been the symbol of his intense identification with and "faith in the American Dream."³² Evaluation of local government in the North has been less positive, but still higher than evaluation of local government in the South.

Systematic research on political trust is rather recent, but what does exist indicates that blacks have always had at least the same distribution as whites on answers to political trust questions focused on the federal government.³³ In fact, when one takes into account the extraordinary amount of interpersonal distrust present in the black community,³⁴ the level of trust in the fed-

eral government has always been remarkable. Our data indicate that this pattern is now breaking down, at least in cities like Detroit. Using the Standard University of Michigan Survey Research Center political trust questions, we found blacks less trusting of both the federal and Detroit governments than whites.³⁵ These differences in levels of political trust are not a function of education, income or other non-racial status discrepancies.

Let us assume that the black power slogan strikes a most responsive chord in the minds of black people who want to break their traditional ties with paternalistic friends and allies. For them, expressing distrust of government, especially the federal government, is in fact a rejection of dependency—an assertion of self-worth and non-utopian thinking about the realities in the United States.³⁶ As we can see in Table 4, expressions of political trust and approval of black power are indeed inversely related. The higher a person's score on the various trust indices, the less likely he is to favorably interpret black power. This relationship is especially strong for trust in the federal government which has traditionally been granted unique esteem in the black community.

When we consider all three indicators of traditionalism together—place of socialization, church affiliation and level of political trust—we see that each is important in its own right (Table 5). The combined explanatory power of these variables is substantial. Only 20 percent of the Southern-born church members who exhibit high levels of trust give approving interpretations of black power compared to 77 percent of the Northern-born non-members who are distrustful of government. Michigan-born church members are a particularly interesting group for further study in that church membership significantly depresses the effects of political trust. Our future research will emphasize the impact of socialization into the secular polit-

³⁰ The impact of region as a variable will surely diminish over time as the effects of national black leadership and the messages of the media and relatives are diffused throughout the nation. However, church affiliation is likely to remain important.

³¹ For example, see William Brink and Louis Harris, *The Negro Revolution in America* (New York: Simon and Schuster, 1964), pp. 131 and 232-233 on black attitudes towards various political institutions and figures.

³² See Louis E. Lomax, *The Negro Revolt* (New York: Harper and Row, 1962), p. 250, and also Gunnar Myrdal, *An American Dilemma* (New York: Harper and Row, 1944), pp. 3-5, 880 and 1007 on blacks as "exaggerated Americans."

³³ Donald E. Stokes, "Popular Evaluations of Government: An Empirical Assessment," in Harlan Cleveland and Harold D. Lasswell, (eds.), *Ethics and Bigness* (New York: Harper and Brothers, 1962), pp. 61-73 and Joel D. Aberbach, *Alienation and Race* (unpublished Ph.D. Dissertation, Yale University, 1967), pp. 119-126.

³⁴ Lee Rainwater's "Crucible of Identity—The

Negro Lower-Class Family" in *DAEDALUS* (1966), especially pp. 204-205 and 215 is very insightful on this point, but this distrust is not confined to lower class ghetto dwellers. See Aberbach, *op. cit.*, pp. 104-114 for a detailed discussion.

³⁵ For a detailed discussion of our findings and a critique of the existing literature on Political Trust see Joel D. Aberbach and Jack L. Walker, "Political Trust and Racial Ideology," a paper delivered at the 1969 Annual Meetings of the American Political Science Association, especially pp. 2-7. A revised version will appear in this REVIEW (December, 1970).

³⁶ Political trust has complex roots. See *ibid.*, pp. 7-13 for an analysis of its origins.

TABLE 4.—GAMMA CORRELATIONS FOR BLACKS
BETWEEN MEASURES OF POLITICAL TRUST
AND FAVORABLE INTERPRETATIONS
OF BLACK POWER

	Trust Detroit Govern- ment**	Trust Federal Govern- ment***	General (Combined) Measure of Political Trust****
Black power interpretation*	-.22	-.52	-.39

* A negative coefficient indicates that the higher a person's score on the various trust indices (high score equals high trust), the less likely he is to favorably interpret black power.

** The Trust Detroit Government measure is a simple additive index of answers to the following questions:

1. How much do you think we can trust the government in Detroit to do what is right: just about always, most of the time, some of the time, or almost never?
2. How much do you feel having elections makes the government in Detroit pay attention to what the people think: a good deal, some, or not very much?

*** The Trust Federal Government measure is a simple additive index of answers to the following questions:

1. How much do you think you can trust the government in Washington to do what is right: just about always, most of the time, some of the time, or almost never?
2. Would you say that the government in Washington is pretty much run for the benefit of a few big interests or that it is run for the benefit of all the people?
3. How much do you feel that having elections makes the government in Washington pay attention to what the people think: a good deal, some, or not very much?

**** The General Political Trust Measure runs from 0 to 4 and equally weights the Trust Detroit Government and Trust Washington Government answers.

ical culture of the Northern black communities, with special attention to the development of more refined indicators which will help us to understand better this acculturation process.

B. Deprivation: Dissatisfaction and Discrimination

We asked our respondents to tell us about "the life you would most like to lead, the most perfect life as you see it." Once they had de-

scribed this kind of life they were shown a picture of a ladder with ten rungs and asked to imagine that their ideal lives were at the top of the ladder, on rung number ten. They were then asked to rank, in comparison with their ideal, their present lives, their lives five years ago, and what they expected their lives to be five years in the future.³⁷ Answers are therefore based on standards meaningful to the individual, with no simple objective indicator of achievement such as education, income or occupation serving as a substitute for his subjectively defined goals.³⁸

³⁷ This is the famous Cantril Self-Anchoring Scale which indicates the discrepancy between an individual's definition of the "best possible life" for him and his past, present, or future situation. See Hadley C. Cantril, *The Pattern of Human Concerns* (New Brunswick: Rutgers University Press, 1965). Our respondents were given the following set of questions:

Now could you briefly tell me what would be the best possible life for you? In other words, how would you describe the life you would most like to lead, the most perfect life as you see it? (Show R card with a Ladder)

Now suppose that the top of the ladder represents the best possible life for you, the one you just described, and the bottom represents the worst possible life for you.

"Present Life" A. Where on the ladder do you feel you personally stand at the present time?

"Past Life" B. Where on the ladder would you say you stood five years ago?

"Future Life" C. Where on the ladder do you think you will be five years from now?

³⁸ In the black community sample, for example, level of education is correlated (Gamma) .06 with scores on the past life ladder, .09 with the present life ladder and .29 with the future life ladder. Education is, therefore, only important as a predictor of assessments of future prospects and even here other factors are obviously at work. Income and occupation work much the same way. It is

TABLE 5.—PERCENTAGES OF BLACK RESPONDENTS FAVORABLY INTERPRETING BLACK POWER
ACCORDING TO CHURCH AFFILIATION, PLACE OF BIRTH, AND LEVELS OF
TRUST IN GOVERNMENT

Level of Trust in Government*	Place of Birth:		South		Michigan	
	Church Membership:		Member	Non-Member	Member	Non-Member
High (2-4)			20% (76)	29% (65)	38% (16)	58% (26)
Low (0-1)			55% (40)	66% (73)	44% (16)	77% (31)

* The General Political Trust measure was employed in this table.

This question revealed a great deal of current dissatisfaction in the black community, but also substantial optimism about the future. When asked to rank their lives five years ago only 13 percent of our black respondents put themselves in the top four categories (7, 8, 9 and 10); when asked to rank their present lives 23 percent place themselves within the top four ranks; but 64 percent chose the top four categories to describe their lives as they expected them to be five years in the future.

As Table 6 indicates, both current dissatisfaction and, to a greater extent, pessimism about the future are strongly related to approval of black power in the zero-order case. When we control for level of education, however, the relationship only holds for the lower education group. The same general trend holds true for reports of experiences of discrimination. However, the differences are less pronounced. Experience of discrimination is a more powerful predictor of fair share or racial unity interpretations of black power for the lower than the upper education group, but it still has a noticeable effect for the upper education group.³⁹

These data fit a general pattern which we have discussed in detail elsewhere.⁴⁰ For lower education blacks, approval of black power is strongly influenced by dissatisfaction with one's current lot and pessimism about the future as well as by reported experiences of discrimination. For blacks with higher levels of educational attainment, however, personal dissatisfaction with present achievements or prospects for the future do not help us to understand favorable interpretations of black power. Even reported personal experiences of discrimination are only moderately related to approval of the slogan. The views on black power of this higher education group are more strongly influenced by their identification with others in the community—their feelings for the group.

Upper status blacks who have broken free from traditional moorings become a part of a *black political community* which includes persons from all social classes. The responses of these upper status blacks to questions about the interpretation of significant events and the evaluation of leaders are most strongly affected by their sense of empathy and identification with

clear that people's evaluations of their achievements vary more within than between objectively defined status groupings.

³⁹Reported experiences of discrimination are unrelated to education (Gamma = .01).

⁴⁰Aberbach and Walker, *op. cit.*, (1969), especially pp. 11-16.

TABLE 6.—CORRELATIONS (GAMMA) FOR BLACKS BETWEEN LADDER POSITIONS ON THE SELF-ANCHORING SCALES, EXPERIENCES OF DISCRIMINATION, AND APPROVAL OF BLACK POWER, BY LEVEL OF EDUCATION

Scales	Zero-Order	Low Education*	High Education*
Present Life**	-.27	-.34	.06
Future Life**	-.40	-.47	-.05
Reported Experiences of Discrimination***	.30	.34	.20

* Respondents in the low education group (N=322) include all those who have completed high school (but had no additional training), while those in the high education group (N=122) have, at minimum gone beyond high school to either specialized training or college. We chose education as a status indicator and dichotomized the sample so as to preserve the maximum number of cases for the analysis.

** The ladders were trichotomized as follows: 1-3 = 0; 4-7 = 1, 8-10 = 2. Therefore, a negative coefficient means that the higher a person's score on the ladder the *less* likely he is to give a fair share or racial unity interpretation of black power.

*** This is a simple additive index of reports of personal experiences of discrimination in Detroit in obtaining housing, in the schools, from a landlord, or in obtaining, holding or advancing on a job.

their racial community than by their feelings of achievement or even their personal expectations about the future. They share a set of beliefs and a mood of protest about racial issues with those lower status segments of the black community who have also assimilated the secular culture typical of the urban North.⁴¹ The major difference between the two groups is that dissatisfaction with one's current lot and prospects for the future interact with church membership, region of socialization and political trust in determining interpretations of black power for the lower education group, but not for the upper education group.

V. THE BLACK POWER IDEOLOGY

So far our attention has been concentrated on the demographic and attitudinal correlates of approval of black power. Some scholars have ar-

Black Power by	Low Education	High Education
Church Membership	-.38	-.42
Place of Birth	.31	.34
Political Trust	-.39	-.37

⁴¹ The correlations (Gamma) between church membership, place of birth and approval of black power are actually slightly higher in the upper education than in the lower education group:

gued that interpretations of this kind of slogan stem from a more comprehensive belief system, a "riot ideology," which is said to be developing within the black community.⁴² We found that knowledge of the black power slogan has diffused widely through the black community of Detroit. There are many different interpretations of the slogan, but only about 8 percent of the population were unable to respond when asked about its meaning. The question remains whether an individual's reaction to black power, be it positive or negative, is related in any logical way to his attitudes about other issues of racial policy, his interpretation of significant events, and his choice of leaders or representatives. In order to investigate this question, we turned to our data in search of evidence of a coherent or constrained belief system on racial matters within Detroit's black community; something we might justifiably call a racial ideology.

Anyone acquainted with recent research on public opinion might doubt the existence of a set of ideas resembling a racial ideology among any but a small activist fringe in the black community. Public attitudes about political leaders or questions of public policy are usually fragmentary and contradictory. Citizens readily express opinions about public issues, but these beliefs seldom hang together in a coherent system; knowing an individual's position on one issue does not allow one to predict his positions on other, related issues. The classical liberal or conservative ideologies may often be employed by political activists or leaders as a guide to policy making, but most citizens seem to use as a guide some form of group identification or other considerations of self interest when formulating their attitudes toward political questions.⁴³

Converse argues that the degree of constraint

⁴² T. M. Tomlinson, "The Development of a Riot Ideology Among Urban Negroes," *American Behavioral Scientist* (1968), pp. 27-31.

⁴³ The best single statement is Philip E. Converse, "The Nature of Belief Systems in Mass Publics," in David E. Apter (ed.), *Ideology and Discontent* (New York: Free Press, 1964), pp. 206-262. For a brief review of this literature see: Lester W. Mibrath, *Political Participation* (Chicago: Rand McNally, 1965); and Herbert McClosky, "Consensus and Ideology in American Politics," this *Review* (1964), 361-382. For some recent work see: Robert Axelrod, "The Structure of Public Opinion on Policy Issues," *Public Opinion Quarterly* (1967), 49-60; and Norman R. Luttbeg, "The Structure of Beliefs Among Leaders and the Public," *Public Opinion Quarterly* (1968), 398-410.

in a belief system is determined most directly by the amount of information the individual has acquired about the issues involved. Levels of information, in turn, are usually affected by the relative centrality or importance of the issues to the individual. The more deeply concerned the individual becomes about a subject, the more likely he is to seek information about it, and, as time passes, to form consistent or comprehensive beliefs about the issues involved. Converse, of course, has dealt most often with liberalism and conservatism in their American incarnations. Comprehensive belief systems of this sort generally "rest upon the kinds of broad or abstract contextual information about currents of ideas, people, or society that educated people come to take for granted as initial ingredients of thought."⁴⁴ This form of contextual or background information is usually accumulated after extensive, formal education, a factor which seems to be a prerequisite to ideological thinking, in most cases. Since only a small minority of the public possesses this important educational prerequisite, ideological thinking is said to be rare.

Since our respondents share the educational limitations of average Americans, and do not have any special access to political information, we would not expect them to be capable of broadly ideological thinking. As Converse suggests at several points, however, it would be unwarranted to infer from this fact that average citizens are incapable of consistent thinking about all areas of public affairs. Even without a grasp of classical liberalism or conservatism and with a minimum of formal education, respondents might have consistent belief systems concerning subjects which they found to be of inescapable personal importance, and which also involved the social groupings with which they most strongly identify.

Bearing in mind the possibility that considerable structure might be uncovered in the social and political thought of our respondents if the proper issues could be identified, we asked open-ended questions at several points in our interview about topics we thought might be salient for our respondents. Using these methods we discovered clear indications that a coherent belief system dealing with racial matters has developed within Detroit's black community. This belief system seems well organized and serves as a guide for most of our respondents in formulating their answers to our questions about racial problems. The high degree of constraint existing among the elements of this belief system is displayed in Table 7 where we present a matrix of

⁴⁴ Converse, *op. cit.*, p. 255.

TABLE 7.—CORRELATIONS (GAMMA) AMONG RESPONSES TO RACIAL ISSUES BY BLACK RESPONDENTS, BY EDUCATION*

		<i>High Education (N = 122)</i>				
		1. Approval of Black Power	2. Word to Describe Riot	3. Sympathy for the Rioters	4. Reasons for the Riot	5. Leader Who Represents You
<i>Low Education (N = 322)</i>	1. Approval of Black Power**	X	.34	.46	.32	.29
	2. Word to Describe Riot**	.36	X	.40	.58	.22
	3. Sympathy for the Rioters**	.45	.30	X	.62	.49
	4. Reasons for the Riot**	.64	.37	.48	X	.41
	5. Leader Who Represents You**	.41	.29	.32	.35	X

* Respondents in the low education group include all individuals who have completed high school (but had no additional training), while those in the high education group have, at minimum, gone beyond high school. Correlations for the high education group are recorded above the diagonal, and those for the low education group are below the diagonal.

** The following items make up this table:

1. What do the words "black power" mean to you? For this table only the signs on the black power code are reversed so that all coefficients are positive.
2. What would you call the events that occurred in Detroit between July 23 and July 28? What word would you use? Open-end question coded as follows: 1) Insurrection; 2) Riot; 3) Disturbance; 4) Lawlessness.
3. Do you sympathize with the people who took part in the (Respondent's term for the event)? 1) yes; 2) somewhat; 3) no.
4. Which of the following comes closest to explaining why the (Respondent's term for the event) took place?: 1) people were being treated badly; 2) criminals did it; 3) people wanted to take things.
5. What single national or local leader best expresses your views on relations between the races? Open-ended question coded as follows: 1) Militant Black Leaders; 2) Other Black Leaders, excluding Martin Luther King; 3) Martin Luther King; 4) White Leaders, excluding Robert F. Kennedy.

A militant is defined here as someone who unequivocally endorsed black power before the time of our interviewing (September, 1967). Persons identifying Robert F. Kennedy were not considered in the calculation of coefficients for this question because of the special nature of his partisans. See below (footnotes to Table.11) for a discussion of this.

correlations of answers by our black respondents to five questions concerning racial issues.⁴⁵ The coefficients appearing below the diagonal are for all those with a high school education, or less, while above the diagonal are findings for those

who have, at minimum, progressed beyond high school to either specialized training or college. The relatively high correlations in this table make us feel justified in referring to this set of opinions as a racial ideology.

One of the most significant aspects of Table 7 is the attitudinal consistency existing among those with lower educational achievements. A careful examination of the table shows that the

⁴⁵ To judge the relative strength of these relationships, see a similar matrix for a national cross-section sample in Converse, *op. cit.*, p. 228.

two educational groups display almost the same levels of constraint. Associations among the upper education group are slightly higher, as earlier research on ideology might lead one to expect, but only by .02, on the average. Further, as we shall establish, respondents in our sample are not only capable of consistency, but display, as well, an impressive amount of knowledge about these questions, and demonstrate the capacity to make several subtle distinctions among leaders and political symbols.

The results of Table 7 are even more significant in view of the fact that three of the five items in the matrix were completely open-ended questions. We have already discussed our open question on the meaning of black power and the way in which we constructed our code and identified favorable and unfavorable responses. The question on the word used by the respondents to describe the riot was also open-ended. At the beginning of each interview respondents were asked what word they would use to describe the events "that occurred in Detroit between July 23rd and July 28th" of 1967, and that word was used by the interviewers throughout the interview. Although some responses were quite unorthodox (one young woman called it a "steal-in" and an older woman called it "God's vengeance on man"), we found it possible to code most of the answers into four categories: revolt, riot, disturbance, and lawlessness, which roughly form a dimension from an understanding of the events as an expression of political demands, to a belief that they were an anomic, lawless outburst. We also asked our respondents, without supplying any cues, to name "the single national or local leader who best expresses your views on relations between the races." The list of leaders mentioned were then arranged according to their publicly stated views on black power. This arrangement was made on the basis of our knowledge of these leaders and their public statements.⁴⁶

Open questions require respondents to formulate their own answers, a formidable challenge to those with limited powers of expression. Some error may be introduced by interviewers when recording answers to open questions, and once they have been recorded, they must be coded. It is extremely difficult, both to construct comprehensive codes for responses of this kind,

and to complete the coding process without introducing even further error. In view of all these difficulties, the relatively strong associations we have found among the items in Table 7 are strong evidence of the existence of a racial ideology. We believe that the success of these techniques and the high degree of consistency in our respondents' opinions was due to their intense interest and concern with racial issues. It would seem that the relative salience of an issue for an individual, or his interest in a subject, is more important than his educational level or his ability to manipulate abstractions in determining the coherence of his beliefs.⁴⁷ Our findings confirm the proposition that where issues of sufficient personal importance are concerned, even the poorly educated are capable of developing relatively sophisticated, inter-related, ideological belief systems.

A. Black Power Ideology and Integration

Some of our respondents may not have an advanced understanding of the justifications for their views, but we are certain that the questions in our matrix require a choice among legitimate alternatives; they are not being translated by our black respondents into simple tests of racial loyalty. An inspection of our questions will show that we are not asking merely if they are sympathetic or unsympathetic toward the aspirations of blacks in America. Our respondents are being called upon to identify and evaluate political leaders as representatives, interpret the causes of the Detroit riot, and define the meaning of a controversial political slogan. One can be closely identified with his racial group and greatly concerned for its welfare, and yet be either *positive* or passionately *negative* about black power, the riot, or many black political leaders. Our black respondents are prevented from employing some simple form of racial chauvinism as a guide for answering our questions because of the necessity of choosing sides in fundamental disputes over the role of blacks in American society which have traditionally divided their racial community.

Some symbols and ideas, of course, seem to be accepted by virtually all members of the black community. Had questions concerning these topics been included in our matrix we would not

⁴⁶ The two remaining questions in the matrix were close-ended and provided respondents with a set of alternative answers from which to choose. See the footnotes of Table 7 for their exact wording.

⁴⁷ See Converse, *op. cit.*; and Roy T. Bowles and James T. Richardson, "Sources of Consistency of Political Opinion," *American Journal of Sociology* (1969), who argue on p. 683, that "interest in politics is a more powerful predictor of both ideological conceptualization and consistency of opinion than is ability to use abstract ideas."

have such strong evidence of a racial ideology, because our responses could then be interpreted as mere expressions of support for the black community. This would have been true, for example, of any questions dealing directly with racial integration. In order to find how both racial groups felt about this issue, each of our respondents was asked whether he favored "racial integration, total separation of the races, or something in between." In response to this question, 27 percent of our white respondents endorsed integration, 17 percent favored total separation, and 54 percent chose "something in between." Even the most sympathetic whites overwhelmingly disapprove of black power, but as we can see in Table 8, approving interpretations of black power came most often from those whites who endorsed integration. The relationship was matched by a separate finding that whites who reported having friends among blacks were somewhat more approving of black power, although blacks who reported having white friends did not differ appreciably from others in their interpretation of the slogan. All of the aversion of whites toward black power cannot be attributed to an aversion toward blacks; some of it grows out of a fear and dislike of the general use of power to achieve social ends, and an unease and resentment of all forms of protest. Nevertheless, it is our impression that when most whites are asked about symbols like black power and integration, they are less likely to respond directly to the complicated issues being raised, but are tempted to translate the questions into the much simpler issue of whether they are favorable or unfavorable toward black people.⁴⁸

When our black respondents were asked the same question about racial integration, 86 percent endorsed integration, while only 1 percent chose separation. Years of struggle against institutionalized segregation and great efforts by opinion leaders in both racial communities for almost a century have made integration a potent, positive symbol for blacks. Asking for an endorsement of this idea is almost akin to asking for an expression of loyalty to the black community. Since we recognized the emotional connotation of these terms we substituted the word "separation" for "segregation" in our questions, but even in this form the positive attraction of integration proved overwhelming. The consensus on the desirability of integration

⁴⁸ The issue of the nature of racial ideology among whites will be explored in Joel D. Aberbach and Jack L. Walker, *Race and the Urban Political Community* (Boston: Little, Brown, forthcoming).

TABLE 8.—PERCENTAGES OF RESPONDENTS FAVORABLY INTERPRETING BLACK POWER, BY RACE, ACCORDING TO ATTITUDES TOWARD INTEGRATION

Form of Race Relations Preferred	Percent Favorably Interpreting Black Power	
	Whites	Blacks
Integration	25% (96)	46% (36+)
Something in Between	8% (197)	46% (54)
Separation	5% (65)	*
	Gamma = -.57	Gamma = .01

* N is less than 5.

includes most black writers and intellectual leaders as well as the average citizens. Debate over the idea has remained sharp and vigorous, but it has primarily concerned the question of whether integration ultimately should result in virtual assimilation, or in some form of social pluralism.⁴⁹

In view of the special status of integration as a symbol within the black community, it is not surprising that we should find conclusive evidence that approval for black power among blacks *does not* imply approval of racial separation. In Table 8 there are no appreciable differences in approval for black power between black respondents who endorse integration and those who do not.

The racial ideology we have identified, even though not merely an expression of racial loyalty, may still have social rather than purely in-

⁴⁹ Strong advocates of black power are almost uniformly in favor of social pluralism and reject cultural assimilation as resting on the demeaning "assumption that there is nothing of value in the black community." (Carmichael and Hamilton, *op. cit.*, p. 53). However, they do not endorse separatism holding that black power is "ultimately not separatist or isolationist." (Hamilton, *op. cit.*, p. 193). The basic idea is that after the black man develops "a sense of pride and self-respect . . . if integration comes, it will deal with people who are psychologically and mentally healthy, with people who have a sense of their history and of themselves as whole human beings." (Hamilton, *op. cit.*, p. 182) Detailed discussion on the meanings of assimilation can be found in Milton M. Gordon, *Assimilation in American Life* (New York: Oxford University Press, 1964).

TABLE 9.—PERCENTAGES OF BLACK RESPONDENTS
FAVORABLY INTERPRETING BLACK POWER
ACCORDING TO WHEN THEY BELIEVE
INTEGRATION WILL OCCUR

Time for Integration	Favorable Interpretations of Black Power		
	Fair Share	+ Black Unity	= Total

Distant Future	22%	33%	55% (206)

tellectual origins. An individual's status or the role he plays in the economy may prompt him to adopt the beliefs of the leaders of his social group because he is convinced that this is a way to advance his own interests. This form of intellectual emulation would be most likely among those, like many of our respondents, who have little education or experience with abstract thinking, and also have a strong sense of group identification. Several beliefs may be appropriated by an individual under these circumstances which may appear to him as natural collections of interdependent ideas, even if he does not have the intellectual capacity to make a similar synthesis of his own. In other words, he may know that several different elements of his belief system naturally go together, and he may also know that certain kinds of responses are considered appropriate for certain kinds of questions, without having any notion of why.⁵⁰

Our respondents' racial ideologies may have originated through this process of social diffusion and group mobilization, but we find enough subtlety in the responses to conclude that many individuals have developed a surprisingly elaborate understanding of the applicability and meaning of the beliefs they hold. For ex-

⁵⁰ Converse discusses this possibility in a section called "Social Sources of Constraint." Converse, *op. cit.*, pp. 211-213. For other treatments of the origins of ideology, see William H. Form and Joan Rytina, "Ideological Beliefs on the Distribution of Power in the United States," *American Sociological Review* (1969), pp. 19-30; Samuel H. Barnes, "Ideology and the Organization of Conflict," *Journal of Politics* (1966), 513-530; Richard M. Merelman, "The Development of Political Ideology: A Framework for the Analysis of Political Socialization," this *Review* (1969), 750-767; Everett C. Ladd, Jr., *Ideology in America* (Ithaca: Cornell University Press, 1969), pp. 341-350; and Robert E. Lane, *Political Ideology* (New York: Free Press, 1962), pp. 213-439.

ample, although virtual unanimity exists within the black community about the desirability of integration as an ultimate goal, there is considerable disagreement over how soon it might occur. As we can see in Table 9, those who believe that realization of the goal is in the distant future are more likely to approve of black power than those who believe it will soon appear. In analyzing our data we have found that the perception of obstacles to racial progress, or the actual experience of some form of discrimination, is related to approval of black power. Table 9 demonstrates that the more pessimistic respondents are also more likely to interpret black power as an appeal for racial unity rather than a call for a fair share or an equal opportunity. There is evidence in this table, and in others we shall present, that the capacity for subtle shifts of emphasis and interpretation is not merely confined to the community's activist minority, but instead is widely diffused among a large segment of Detroit's black population.

B. Black Power Ideology and the Detroit Riot

The Detroit riot of July, 1967 caused fear and anxiety among almost all the citizens of the city, both black and white. Immediate reactions to the event ranged from those who believed it was a sign that the Negro citizens of the city were

TABLE 10.—PERCENTAGES OF RESPONDENTS
FAVORABLY INTERPRETING BLACK POWER, BY
RACE, ACCORDING TO WORD THEY
USE TO DESCRIBE THE RIOT

a. Total Sample			
Word Used to Describe Riot	Percent Favorably Inter- preting Black Power		
	Whites	Blacks	
Revolt	32% (28)	62% (51)	
Riot	10% (212)	50% (194)	
Disturbance	0% (19)	33% (42)	
Lawlessness	8% (25)	27% (33)	
b. Black Respondents Only			
Word Used to Describe Riot	Interpretation of Black Power		
	Fair Share	+ Racial Unity	= Total
Revolt	25%	37%	62% (51)
Riot	23%	27%	50% (194)
Disturbance	19%	14%	33% (42)
Lawlessness	21%	6%	27% (33)

rising up in revolt against discrimination and injustice to those who saw it as an uncivilized expression of lawlessness and hooliganism. If, as we have suggested, responses to black power are a part of an individual's basic orientation toward race relations, there should be a strong relationship between his response to this slogan and his evaluation of the causes and consequences of the riot.

In Table 10a we can see that in both races those who use the word "revolt" to describe the events were much more likely to express approval for black power. In Table 10b where the black respondents are divided according to whether they gave racial unity or fair share responses we find that racial unity interpretations clearly predominate among those who see the riot as a protest against injustice. This is another demonstration of the shift in emphasis that occurs among those who are most aware and resentful of discrimination and inequality. The more convinced our black respondents are of the existence of injustice, the more they begin to interpret black power as a call for racial solidarity.

C. Black Power Ideology and the Choice of Leaders

Our respondents were asked to name "the single national or local leader who best expresses your views on relations between the races." This question, like the one on black power, was completely open ended. Table 11 displays the relationship for Negroes between the selection of various leaders and fair share or black unity interpretations of black power.

The list of leaders is arranged so that the percentage totals of respondents favoring black power are in descending order. The table seems to us to indicate the validity of our measure since respondents identifying with militant black leaders are the most favorably disposed towards black power while those choosing white leaders are least positive. In addition, the assumptions we made earlier about the meaning of the "black take-over" and "nothing" responses also seem warranted as individuals who identify with the least militant leaders most often give responses of this kind.

There are some more subtle differences revealed in this table. Negroes who felt best represented by black leaders other than the late Martin Luther King favored racial unity over fair share definitions of black power by a ratio of two to one. Dr. King's partisans, however, heavily emphasized fair share definitions. In addition, the likelihood of a favorable definition of black power is a direct function of the type of

TABLE 11.—PERCENTAGE OF BLACK RESPONDENTS FAVORABLY INTERPRETING BLACK POWER ACCORDING TO THEIR SELECTION OF A LEADER BEST REPRESENTING THEIR VIEWS ON RACE RELATIONS

Leader Best Representing Respondent*	Black Power Interpretation		
	Fair Share	+ Racial Unity	= Total
Militant Black Leaders (N=59)	26%	50%	76%
Robert F. Kennedy (N=17)	12%	47%	59%
Other Black Leaders, excluding Martin Luther King (N=107)	17%	34%	51%
"No One" (N=20)	10%	30%	40%
Martin Luther King (N=150)	28%	10%	38%
White leaders, excluding Robert F. Kennedy (N=30)	11%	13%	24%

* Question: What single national or local leader best expresses your views on relations between the races?

N's in parentheses are the bases for the calculation of percentages, i.e., persons giving don't know or no answer responses to the black power question were not used in the table.

Total N's for the categories on leadership are given in the explanations of the leader classifications below:

A *militant black leader* (N=61) is defined here as someone who unequivocally endorsed black power before the time of our interviewing (September, 1967). They include: Muhammed Ali (N=3); H. Rap Brown (N=9); Stokely Carmichael (N=15); State Senator James Del Rio (N=13); Dick Gregory (N=6); Floyd McKissick (N=3); Adam Clayton Powell (N=8); and Rev. Albert Cleage (N=4). Del Rio and Cleage are local figures.

Robert F. Kennedy (N=21).

Other black leaders, excluding Martin Luther King (N=111) mentioned were: Senator Edward Brooke (N=16); Ralph Bunche (N=3); U. S. Representative John Conyers (N=31); U. S. Representative Charles Diggs (N=17); Detroit Common Councilman Nicholas Hood (N=10); Detroit Urban League Head Francis Kornegay (N=1); Judge Thurgood Marshall (N=4); Carl Rowan (N=1); Roy Wilkins (N=17); State Senator Coleman Young (N=1); Whitney Young (N=5). Hood, Kornegay and C. Young are local figures.

"No One" (N=21).

Martin Luther King (N=165).

White Leaders, excluding Robert F. Kennedy (N=33), mentioned were: Senator Dirksen (N=1); President Eisenhower (N=1); TV Commentator Lou Gordon (N=1); Vice President Humphrey (N=1); President Johnson (N=14); President Kennedy (N=9); Walter Reuther (N=3); Governor Romney (N=3). Gordon is a local figure.

The total N=412. Of the remaining 49 individuals in our black sample, 27 could not answer the question and 22 mentioned their minister (no name given), coach or assorted persons (including themselves) we could not categorize with confidence on a leadership spectrum.

black leader selected. As a general rule, the more militant the leader who represents the respondent, the greater the chance of a positive orientation toward black power.

Over seventy-five percent of our Negro respondents chose a black leader who best represented their views, but there were white leaders selected as well and instances where the interviewee could make no selection. The number of respondents who could not name a leader is

small and we have divided them into two groups. "No one" is a category for individuals who decisively stated that they had no representative. This tiny group was often cynical about black power (and everything else) with over one-third saying that black power meant "nothing" to them. When they did define the slogan, however, black unity was the dominant theme. Another small group ($N = 25$) simply could not think of any person who represented them and they were also unlikely to answer the question about black power (i.e., they were coded in the don't know or no answer category on black power). These individuals were not visibly cynical about racial leaders or approaches; they were simply uninformed.

Thirty-one respondents identified with white leaders other than the late Senator Robert F. Kennedy. They were generally negative about black power, showing no meaningful preference for either positive interpretation. Over fifty percent of the black respondents who selected Senator Kennedy, however, gave favorable definitions of black power and they were disposed towards racial unity definitions of the term by a ratio of four to one. While the number of people who named Senator Kennedy is small, his importance as a link with the more militant elements in the black community should not be underestimated. The severing of this connection between the white and black worlds is a major tragedy. In the next phase of our research we will explore the impact of the deaths of both Kennedy and King on the beliefs of their followers.

D. Black Power Ideology: An Overview

Black power has no direct, generally accepted meaning, but the slogan still provokes strong responses from both blacks and whites. The power of all effective political slogans lies in "the emotional charges or valences they carry, the very elements that make cognitions dissonant or consonant," and in "their associative meanings, the very ambiguities that permit them, like Rorschach ink blots, to suggest to each person just what he wants to see in them."⁵¹ In their efforts to shape a meaning for black power, our black respondents have fallen back upon fundamental sets of beliefs which have spread throughout all sectors of their racial community. Many of those who share these beliefs may be unaware of their most profound implications, but the beliefs are consistently organized in the minds of our respondents primarily because they are securely focused on the issue of racial injustice in Amer-

ica, a problem faced by most blacks in one form or another virtually every day of their lives.

When Converse speaks of ideological thinking, of course, he usually refers to "belief systems that have relatively wide ranges and that allow some centrality to political objects."⁵² The racial ideology we have identified has a much narrower range. Given the limitations of our data, we cannot be sure that individuals holding a consistent racial ideology would also have consistent opinions about federal aid to education, or governmental measures designed to ensure full employment. Those with a racial ideology might be able to think in coherent ways only about questions of public policy which bear some relationship to the status of blacks in American society, but not about the general relationship between government and private business, or about America's relations with foreign countries.

The ideology of black power is not a wide ranging, highly elaborated, political world view. Nevertheless, the tone and quality of American political life in the latter 1960's was profoundly altered by the development of this belief system and its exceptionally wide diffusion among black Americans. In its radical form, as it is developing among our more disillusioned black respondents, the belief system includes doubts about the possibilities of realizing the goal of integration in the near future, sympathetic explanations of the July, 1967 disturbances in Detroit and a revolutionary label for them, selection of a militant leader as a spokesman, skepticism about improvements in the quality of life in the future, and a definition of black power which stresses the need for greater racial solidarity. This system of beliefs does not arm many of our respondents with concrete programs of social and economic reform, but in spite of its limited scope, its existence is of great potential significance. Its impressively wide diffusion is a striking indication of the growing mobilization and increasing sense of group identification within the black community.

VI. SUMMARY AND CONCLUSIONS

Black power is a potent, meaningful slogan for most of our respondents. Some react with fear, others with cynicism, many with warm approval or strong disapproval, but in most cases reactions are intense and interpretations of the idea's meaning are related to an individual's basic orientation toward social and political problems. Whites have an overwhelmingly negative reaction to black power. The slogan is seen by most whites as an illegitimate, revengeful challenge. Among blacks, however, about forty-two

⁵¹ Robert E. Lane, *Political Thinking and Consciousness* (Chicago: Markham, 1969), p. 316.

⁵² Converse, *op. cit.*, pp. 208-209.

percent of our sample see the term either as a call for equal treatment and a fair share for Negroes, or as an appeal for racial solidarity in the struggle against discrimination.

The partisans of black power among Negroes are somewhat younger than the rest of the black community, but neither their age nor other standard demographic factors, such as income, occupation, and education, are very helpful in explaining the distributions we have found. Sharp divisions exist within the Detroit black community, but they are not merely the result of a clash between young and old; instead, they represent a clash between those who have appropriated the cosmopolitan, secularized culture typical of the North and those whose social outlook and political attitudes are rooted in the paternalistic culture of the South. Approval for black power, as our analysis has shown, comes most often from those who were born or grew up in Detroit, are not members of churches, and have begun to doubt the trustworthiness of government in both Detroit and Washington.

Black power is the rallying cry of a generation of blacks whose fathers fled from the South to seek a new life in the "promised lands" of Detroit, New York, or Chicago. The move from the grinding poverty and overt oppression of the South to the cities of the North was seen as a great step forward by the original pioneers. But most of their children cannot be satisfied by these changes. In the words of Claude Brown:

The children of these disillusioned colored pioneers inherited the total lot of their parents—the disappointments, the anger. To add to their misery, they had little hope of deliverance. For where does one run to when he's already in the promised land?⁵³

This modern generation finds little compensation or hope in the evangelical, "old time religion" of their parents, nor do they share the traditional faith of Southern Negroes in the ultimate benevolence of white men. Many are distrustful of government, unimpressed with most of the civic notables and established political leaders of both the black and white communities, and increasingly pessimistic about their chances to achieve a satisfactory life in this country. They have not surrendered the ultimate aim of social equality and racial integration, but they have begun to doubt that the goal will be reached in the foreseeable future.

We encountered few racist, anti-white interpretations of black power among our black respondents and most of those came from respondents who were *not* sympathetic to black power.

There was chauvinism and some glorification of blackness, especially among those who interpret black power as a call for racial unity or solidarity, but most were pro-black rather than anti-white. Black unity definitions of black power are not disguised appeals for separation from American society; at least, not at the present moment. If insufficient progress toward racial accommodation is made in the future and tensions continue to mount, separatist sentiments might begin to spread within the black community. Today, we find, instead, a deep concern with the rights of and desires for respect within the American black community. These feelings are most eloquently expressed in the interpretation of black power given by one of our young respondents:

(black, male, 19, 12 grades) It means mostly equality. You know, to have power to go up to a person, you know, no matter what his skin color is and be accepted on the same level, you know, and it doesn't necessarily have to mean that you gotta take over everything and be a revolutionary and all this; just as long as people are going to respect you, you know, for what you are as a person and not, you know, what your skin color has to do with the thing.

Restraining ties with the traditional culture of the South are being steadily eroded as the percentage of blacks who were born and grew up in the North increases, the influence of the church wanes, and faith in the benevolence of paternalistic friends and allies weakens. The children born in Detroit since World War Two are coming of age politically in the midst of a social revolution. Events as diverse as the Detroit riot, the dominance of black athletes in every major American spectator sport, the collapse of colonial empires in Asia and Africa, the total integration of the American armed forces, and the murders of Martin Luther King and Robert Kennedy are all accelerating the break with traditional modes of thought and accommodation. The reservoir of potential supporters for black power is bound to grow.

The social revolution now in progress has resulted in a more unified, more highly mobilized black political community. Franklin Frazier's accommodating, apolitical "black bourgeoisie"⁵⁴ is rapidly disappearing as the sense of empathy and racial identification among the black middle class grows stronger. This developing racial community is profoundly restless and is searching for new forms of political expression and participation. The result of this search is likely

⁵⁴ E. Franklin Frazier, *Black Bourgeoisie* (New York: Free Press, 1957).

TABLE 12.—PERCENTAGES OF BLACK RESPONDENTS
FAVORABLY INTERPRETING BLACK POWER
ACCORDING TO THEIR WILLINGNESS TO
TAKE PART IN A RIOT

Would You Riot*	Percent Favorably Interpreting Black Power
No:	35% (262)
Yes:	57% (60)
Maybe:	69% (93)

* Question: Can you imagine any situation in which you would take part in a _____ (respondent's term for the events of July, 1967)?

to be increased activity of all kinds, both conventional and unconventional. Our data indicate a willingness to participate in political campaigns and elections on the part of even the most militant advocates of black power. Their involvement in this activity, however, would not preclude their taking part in other, more flamboyant, forms of protest.

No single, dominant tactical stance is likely to evolve among blacks; questions about the feasibility and utility of tactics are major sources of disagreement within the black community. Most of our black respondents, for example, believe the Detroit riots of 1967 were an understandable reaction to social injustice, and there is some sympathy for the individuals who actually did the rioting, but there is almost no approval of the sniping and fire bombing that took place. Extreme violence of this kind is presently thought of as a legitimate or useful expression of grievances by only a tiny minority of blacks in Detroit, but many others express considerable ambivalence about the utility of violent protests. For example, when we asked our black respondents, "Can you imagine any situation in which you would take part in a _____ (respondent's term for the events of July, 1967)?" a majority said no, but, as we can see in Table 12, respondents who expressed ambiva-

lence were even more supportive of black power than those who said they definitely would participate. This undecided group is a substantial proportion of our sample, they have made the sharpest break with traditional forms of social thought, they are the most sympathetic toward the black power ideology, and they are wavering.

The outcome of this search by blacks for acceptable modes of political expression will depend primarily on the behavior of whites, both those who control all the public and private institutions that matter, and the average citizens who must adjust to changes in prevailing customs. If Detroit's future is to be peaceful, ways must be found to pull down the barriers to equal opportunity which now exist, and there must be radical improvement in the prospects for personal advancement of the city's black population. Although success in these efforts depends, in large measure, on the flexibility and compassion of the whites, it also depends on the capacity of many public and private governmental institutions to mobilize the resources necessary to create a decent, livable, urban environment.

Some of the most important decisions about Detroit's future will not be made in the city, but in Washington, in suburban city halls, or in the state capitol in Lansing; the policies adopted by labor unions, businesses and manufacturers in the city will probably be more important than anything done by the officials of city government. This complex, decentralized system of social choice, with its elaborate checks and balances and its many barriers to radical change, will be faced during the next decade with an insistent challenge from a new generation of black Americans. To successfully meet their demands large efforts will have to be made toward the creation of a truly inter-racial society. Depending on the extent and success of these efforts, this new black generation could either become a persuasive and creative new influence within the democratic system, or a force bent on the violent disruption of American urban life.

DIMENSIONS OF POLITICAL ALIENATION*

ADA W. FINIFTER

Michigan State University

In recent years there has emerged in this country a radical questioning and rejection of established political institutions unparalleled since the Civil War in its intensity and scope. One objective indicator of this trend since World War II is the marked rise in voluntary renunciation of American citizenship, an act which represents the formal and final estrangement of the individual from his former political ties.¹ Available evidence suggests that estrangement from the polity is also widespread in countries throughout the world as fundamental questions are being raised about the legitimacy of political institutions and political leadership.

Attitudes toward the political system have long been a concern of political scientists. Major orienting theories of the political system suggest that citizen support plays a crucial role in determining the structure and processes of political systems. Almond and Verba, for example, use the concept "civic culture" to refer to a complex mix of attitudes and behaviors considered to be

conducive to democratic government.² Easton underscores the fundamental importance of attitudes for system stability, focusing especially on "diffuse support" as a prerequisite for the integration of political systems. He suggests that "(w)here the input of support falls below [a certain] minimum, the persistence of any kind of system will be endangered. A system will finally succumb unless it adopts measures to cope with the stress."³

The conversion of these general theoretical ideas into systematic empirical theory requires further rigorous and comprehensive analyses of types of citizen support and the development of empirical indicators for this domain.⁴ The concept of alienation, which may be conceived as one end of a continuum whose opposite extreme is defined by the concepts of support or integration, offers a useful vantage point from which to pursue this goal. The long history of intellectual concern with alienation has resulted in a literature rich in concepts and suggestive hypotheses which may provide a valuable perspective from which to develop an empirical theory relating citizen attitudes to the structures and processes of the political system.

I. DIMENSIONALIZING POLITICAL ALIENATION

There have been a number of recent theoretical and empirical efforts to explicate and clarify the concept of alienation.⁵ The most fruitful of

² Gabriel Almond and Sidney Verba, *The Civic Culture* (Princeton: Princeton University Press, 1963).

* The analysis reported here was initially undertaken as part of the author's dissertation, *Dimensions of Political Alienation: A Multivariate Analysis*, University of Wisconsin, 1967, which was supported by the National Science Foundation Graduate Fellowship Program. I am grateful to the University of Wisconsin Computing Center and the Michigan State University Computing Laboratory for making funds available for computer time, and to the Department of Political Science, Michigan State University, for support. I am especially indebted to Bernard M. Finifter for his sustained interest and his many thought-provoking comments. I would also like to thank Paul Abramson, Rufus Browning, Aage Clausen, and Jack Dennis for their useful suggestions on earlier versions of this paper.

¹ While the motivations involved are unknown, renunciation of nationality appears to have strong content validity as a "hard" indicator of political estrangement. Formally recorded renunciations of nationality have increased consistently over the last two decades, from 149 in 1950 to 679 in 1968. (See *Annual Reports*, Immigration and Naturalization Service, United States Department of Justice.) This represents almost a quadrupling of the rate, from .15 per 100,000 voting age population in 1950 to .57 per 100,000 voting age population in 1968.

these involve attempts to specify particular *modes* of alienation by identifying the essential meanings of this attitudinal orientation.⁶ This approach seeks to decompose a global concept into its component parts and thus may be referred to as one of *dimensionalization* of the concept. The research reported here utilizes this approach in developing concepts and measures of *political* alienation. In this respect it differs from most past efforts in that its focus is on attitudes which refer specifically to the institutions of government and the political process. Even when concerned with the specification of the mode of alienation, much previous research has been non-specific regarding the particular social institutions toward which such attitudes are directed. Since it has not been established, however, that alienation is normally an attitude which is either generalized over several modes or over a number of different social institutions, it would seem most useful to specify both the *mode* of alienation and the particular institutional *referent* in the operationalization of the concept. In this way, the actual extent of generalization, both as to mode and referent, can be determined by empirical investigation. In a sense, the present research "holds constant" the institutional referent of alienation by dealing only with attitudes toward aspects of the political system; the goal is to specify major modes of alienation directed toward this particular institutional sector.

The Career of a Concept," *New Politics*, 1 (Spring, 1962), 116-134; Arthur G. Neal and Salomon Rettig, "Dimensions of Alienation among Manual and Non-Manual Workers," *American Sociological Review*, 28 (August, 1963), 599-608; Kenneth Keniston, *The Uncommitted* (New York: Dell, 1965), esp. pp. 449-476; and Charles J. Browning, *et al.*, "On the Meaning of Alienation," *American Sociological Review*, 26 (1961), 780-781.

⁶See, especially, Seeman, *op. cit.*, and Neal and Rettig, *op. cit.* In his stimulating discussion, Keniston uses the term "mode" to express whether alienation is manifest as an attempt to change society (alloplastic) or is, rather, directed inwardly toward change in the individual himself (autoplastic). Keniston, *op. cit.* Although the behavioral expression of alienation is of obvious relevance to a theory of political alienation, it seems to me that it does not need to be made part of the definition of the concept itself but might be treated as a separate variable whose relation to the *attitude* of alienation is conditioned by other variables such as the opportunities for social change present in the system, or certain psychological characteristics of the individual.

It is useful to distinguish at least four different ways in which alienation toward the polity may be expressed.⁷

1) "Political powerlessness" may be defined as an individual's feeling that he cannot affect the actions of the government, that the "authoritative allocation of values for the society," which is at the heart of the political process, is not subject to his influence. Political decisions, which determine to a great extent the conditions under which the individual lives, may appear to be *happening to* individuals who feel powerless, independent of or in spite of their own judgment or wishes. This mode of alienation is closely related (inversely) to the concept of "political efficacy," which has achieved such prominence in studies of voting behavior.⁸

2) "Political meaninglessness" may be said to exist to the extent that political decisions are perceived as being unpredictable. A perceived random pattern of decision making would, of course, prevent an understanding of the political system. This mode of alienation is distinguished from the first in that in the case of powerlessness decisions may be clear and predictable, but are simply not subject to the influence of the individual; in the case of meaninglessness, however, the individual perceives no discernible pattern. This feeling is illustrated by an individual's inability to distinguish any meaningful political choices, and the sense that political choices are themselves meaningless, because one cannot predict their probable outcomes nor, consequently, use them to change social conditions.

3) Following Durkheim's use of "anomie," which denotes a devaluation of social norms regulating individual behavior, "perceived political normlessness" is defined as the individual's perception that the norms or rules intended to

⁷The concepts of "powerlessness," "meaninglessness," and "isolation," used here are based on Seeman's discussion of their generic types; the present discussion specifies how these modes of alienation relate to *political* institutions. The concept of "normlessness" developed here departs from the meaning attached to this term by Seeman. In addition to these four types, Seeman also discusses a type of alienation identified as "self-estrangement." The sense in which this type of alienation can be said to have an institutional referent is unclear.

⁸See especially the work emanating from the University of Michigan studies, most notably Angus Campbell, Philip E. Converse, Warren E. Miller and Donald E. Stokes, *The American Voter* (New York: John Wiley, 1960).

govern political relations have broken down, and that departures from prescribed behavior are common. A belief that officials violate legal procedures in dealing with the public or in arriving at policy decisions exemplifies this mode of alienation.

4) "Political isolation" refers to a rejection of political norms and goals that are widely held and shared by other members of a society. It differs from perceived normlessness in which there is implicit *acceptance* of some set of norms from which *others* are perceived to be deviating. Political isolation can be illustrated by a belief that voting or other socially defined political obligations are merely conformist formalities, or, indeed, that public participation is inappropriate in the formulation of public policy. This type of alienation is consistent with Lane's description of alienated individuals as feeling that "the rules of the game are unfair, loaded, illegitimate; the Constitution is, in some sense, fraudulent."⁹ To the extent that social norms are dynamic, however, a state of isolation at one point in time may entail a different attitude set than isolation at another time. Similarly, to the extent that social norms differ from culture to culture, alienation in this mode can only be understood with reference to the prevailing normative patterns of particular societies.

Conceptual dimensionalization of an attitudinal domain implies a set of hypotheses about the relationships among empirical measures of the various dimensions. Although some previous work on alienation has demonstrated separate dimensions empirically,¹⁰ studies using measures with direct *political* relevance frequently *assume* the existence of separate attitudinal dimensions without actually providing evidence to substantiate this assumption.¹¹ The present study pur-

sues this line of inquiry further by exploring the dimensionality of attitudes toward the political system. If the hypothesis that distinct modes of political alienation exist can be substantiated, then it would seem imperative that future discussions of attitudinal support for political systems specify the sense in which "support" or "alienation" is being used, and consider the likelihood that different modes of support or alienation may be differentially related to other theoretically important variables.

II. CONSTRUCTION OF MEASURES

The data used in this study are derived from interviews collected from a nation-wide probability sample in the United States in early 1960. A description of sampling procedures has been published elsewhere.¹² Twenty-six questions, whose manifest content was judged related to the political alienation domain, were examined to determine their dimensionality. These items arranged according to their final allocation to two scales of political alienation, are presented in Table 1.

The matrix of intercorrelations among these questions, arranged in a linked-simplex structure in which the largest correlations appear along the main diagonal, is presented as Table 2. This method of displaying the data has the advantage that "the factorial structure of a matrix may be anticipated quite directly by looking at the arrangement of correlations of variables."¹³

Aberbach reports that factor analysis confirmed the dimensionality of several different measures of alienation, including two measures of political alienation. He does not report the factor loadings, although he describes them as "strong." His data support the utility of considering specific types of political alienation separately. See Joel Aberbach, "Alienation and Political Behavior," this REVIEW, LXIII (March, 1969), 86-99. Two recent articles dealing with support for particular political institutions also use factor analytic techniques to dimensionalize attitudes. See Jack Dennis, "Support for the Party System by the Mass Public," this REVIEW, LX (September, 1966), 600-615 and G. R. Boynton, S.C. Patterson and R. D. Hedlund, "The Structure of Public Support for Legislative Institutions," *Midwest Journal of Political Science*, XI (May, 1968), 163-180.

¹² See Almond and Verba, *op. cit.*, pp. 519-523. The data were made available by the Inter-University Consortium for Political Research. Neither Professors Almond nor Verba nor the Consortium bear any responsibility for the analyses or interpretations presented here.

However, in a recent publication, Aber-

TABLE 1. QUESTIONS USED AS MEASURES OF POLITICAL ALIENATION*

Component I: "Political Powerlessness"

- 13a. If you wanted to discuss political and governmental affairs, are there some people you definitely wouldn't turn to—that is, people with whom you feel it is better not to discuss such topics? About how many people would you say there are with whom you would avoid discussing politics? (*discuss with no one*)
14. Some people say that politics and government are so complicated that the average man cannot really understand what is going on. In general, do you *agree* or disagree with that?
15. How do you feel about this? Thinking of the important national and international issues facing the country, how well do you think you can understand these issues? (*not at all*)
16. How about local issues in this town or part of the country? How well do you understand them? (*not at all*)
23. If you made an effort to change this regulation, how likely is it that you would succeed? (hypothetical local regulation considered to be "very unjust or harmful") (*not at all likely*)
24. If such a case arose, how likely is it that you would actually try to do something about it? (local regulation) (*not at all likely*)
27. If you made an effort to change this law, how likely is it that you would succeed? (hypothetical national law considered to be "very unjust or harmful") (*not at all likely*)
28. If such a case arose, how likely is it you would actually try to do something about it? (national law) (*not at all likely*)
- 31a. Thinking now about the national government in Washington, about how much effect do you think its activities, the laws passed and so on, have on your day-to-day life? Do they have a great effect, some effect, or *none*?
- 32a. Now take the local government: about how much effect do you think its activities have on your day-to-day life? Do they have a great effect, some effect, or *none*?
- 72f. People like me don't have any say about what the government does. (*Agree-Disagree*)

Component II: "Perceived Political Normlessness"

- 18a. One sometimes hears that some people or groups have so much influence over the way the government is run that the interests of the majority are ignored. Do you *agree* or disagree that there are such groups?
- 31b. On the whole, do the activities of the national government tend to improve conditions in this country, or would we be *better off without them*?
- 32b. On the whole, do the activities of the local government tend to improve conditions in this area, or would we be *better off without them*?
34. Suppose there were some question that you had to take to a government office—for example, a tax question or housing regulation. Do you think you would be given equal treatment? I mean, would you be treated as well as anyone else? (*No*)
35. If you explained your point of view to the officials, what effect do you think it would have? Would they give your point of view serious consideration, would they pay only a little attention, or would they *ignore* what you had to say?
- 37a. If you had some trouble with the police—a traffic violation, maybe, or being accused of a minor offense—do you think you would be given equal treatment? That is, would you be treated as well as anyone else? (*No*)
- 37b. If you explained your point of view to the police, what effect do you think it would have? Would they give your point of view serious consideration, would they pay only a little attention, or would they *ignore* what you had to say?
51. The Republican party now controls the administration in Washington. Do you think that its policies and activities would ever seriously endanger the country's welfare? Do you think that this *probably would happen*, that it might happen, or that it probably wouldn't happen?
52. If the Democratic party were to take control of the government, how likely is it that it would seri-

* Question numbers refer to the original interview schedule as reported in Gabriel Almond and Sidney Verba, *The Civic Culture* (Princeton: Princeton University Press, 1963), Appendix B. Code categories were arranged to represent assumed ascending degrees of political alienation, the highest point of which is underlined for each question.

TABLE 1 (Continued)

ously endanger the country's welfare? Do you think that this *would probably happen*, that it might happen, or that it probably wouldn't happen?

72d. All candidates sound good in their speeches, but you can never tell what they will do after they are elected. (*Agree—Disagree*)

Items Omitted

45. Some people feel that campaigning is needed so the public can judge candidates and issues. Others say that it causes so much bitterness and is so unreliable that we'd be better off without it. What do you think? Is it needed or would we be *better off without it*?

46. Do you ever get angry at some of the things that go on in election campaigns? Do you *often* get angry, do you sometimes get angry, or do you never get angry?

47. Do you ever find election campaigns to be pleasant and enjoyable? Do you *often*, do you sometimes, or do you *never* find them pleasant and enjoyable?

48. Do you ever find election campaigns silly or ridiculous? Do you *often*, sometimes, or never find them silly or ridiculous?

72a. The way people vote is the main thing that decides how things are run in this country. (*Agree—Disagree*)

The scales used in this research resulted from an interplay between factor and item analysis techniques which are described here in summary fashion. The matrix of correlation coefficients among alienation measures was analyzed by the principal components method.¹⁴ Eight components with eigenvalues above 1.0 were extracted. The simplex arrangement of the matrix suggested two distinct dimensions.¹⁵ However, in order to allow for the possible emergence of a third component of items with unclear relations to the two dominant clusters, the first three components extracted were retained for rotation by the Varimax criterion. The initial three-component solution was judged to be unacceptable for its poor approximation to simple structure.¹⁶ The pattern of loadings suggested that rotation to two components might yield a clearer solution. This was indeed the case. These results, combined with the item analysis data, isolated

five items which were of questionable relation to these dominant components, and they were eliminated.¹⁷ A second principal-components analysis was performed on the remaining twenty-one items. Seven components with eigenvalues above 1.0 were found; the first two were clearly dominant (4.3 and 2.0) while the remaining values dropped rapidly (1.4, 1.3, 1.2, and 1.0). Because of their clarity and strength, the first two components were retained for rotation, resulting in the pattern displayed in Table 3. This solution was accepted as a satisfactory approximation to simple structure. All of the items are clearly associated with one of the two major components.

The manifest content of the eleven items constituting the first component strongly suggests the "powerlessness" dimension of alienation described above. As stipulated in the a

Matrices: Some New Emphases," *Public Opinion Quarterly*, XXII (Winter, 1958-59), p. 523.

¹⁴For a comparison of the components and factor models see Harry H. Harman, *Modern Factor Analysis* (Chicago: The University of Chicago Press, 1967), Chapter 8.

¹⁵Questions 24, 28, 27, 23, 15, 16, 72f and 14 compose one strong cluster, each having a correlation of .3 or higher with at least one other variable in the cluster, and Questions 37b, 35, 34, 37a, 32b, 31b, 51, and 52 form a weaker but identifiable second cluster.

¹⁶See L. L. Thurstone, *Multiple Factor Analysis* (Chicago: University of Chicago Press, 1947), p. 335, and J. P. Guilford, *Psychometric Methods* (2nd ed.; New York: McGraw-Hill, 1954), p. 508.

¹⁷Specifically, the results of the two-component, twenty-six item solution demonstrated that (a) Qs. 45 and 72a had weak loadings on *both* components, and (b) Q. 46 loaded *negatively* on its dominant component. To investigate further the structure of the items, Qs. 46 and 72a were eliminated, and two scales were formed using a cluster scoring procedure. Item analyses (based on response choice-total scale biserial correlations) indicated that Qs. 46, 47, and 48 were only weakly related to the dominant content of their scales. Since all three of these questions concerned attitudes toward election campaigns (as did Q. 45, which was eliminated because of its weak loadings), it seemed reasonable to conclude that the domain tapped by these questions was essentially different from that of the other items and all were eliminated.

* Decimals have been omitted. N=970. Correlations of .06 are significant at the .05 level; correlations of .05 or less are not significant. Data were coded as the mean of continua or the mode of dichotomies.

priori description of this dimension, the defining items (15, 23, 24, 27, and 28) refer to the individual's ability to understand important national and international issues facing the country, his propensity to do something about either a local regulation or a national law that he thinks unjust, and his subjective assessment of the efficacy of such efforts. Other items (14, 16, and 72f) share similar content, relating to the individual's ability to understand and affect the political process. Two of the items (31a and 32a) tap the respondent's understanding of the multifarious effects of government on the lives of citizens. Question 13a measures a fear or shunning of political discussion, which indicates a feeling of low ability to cope with the political environment. These interpretations support the identification of the first component as "political powerlessness."

The defining items of the second component are 34, 35, 37a, and 37b. These questions refer to the treatment expected by the individual from two different governmental agencies. These questions appear to assume a norm of equal and considerate treatment of citizens by government officials, and may be considered to refer ultimately to the legal norm represented by the constitutional guarantee of equal protection.¹⁸ Lack of congruence between this norm and actual behavior may be considered as an indication of deterioration in the normative structure. Accordingly, the *subjective* assessment of the existence of this state can be interpreted as a condition of "perceived normlessness." That is, the individual who thinks that he would receive unequal treat-

¹⁸ Consistent with this interpretation, Almond and Verba report that these questions were intended to measure the "qualities our respondents imputed to the executive side of government." *Op. cit.*, p. 106. At a different point in their analysis, however (see especially Chapter 8), they use these questions as measures of "administrative competence," which might be construed as a sub-type of *powerlessness*. There is clearly some conceptual overlap here. Although a sense of departure from community norms is being used in the present study to define "perceived normlessness," it is obvious that, when the particular norm in question refers to the role the individual should play in his interactions with political decision-makers, assessments of norm deviations may also reflect feelings of powerlessness. That items 34, 35, 37a, and 37b have quite low loadings on the factor that is here called "powerlessness" increases confidence that their interpretation in terms of role expectations and norm deviations is more adequate than an interpretation using the powerlessness concept.

TABLE 3.—ROTATED COMPONENT STRUCTURE OF TWENTY-ONE ALIENATION ITEMS

Question	Content	Component I	Component II
28	Likelihood of action to change unjust national law	.69	.08
15	Understanding of national and international issues	.68	.13
24	Likelihood of action to change unjust local regulation	.66	.08
27	Perceived efficacy of efforts to change national law	.62	.11
23	Perceived efficacy of efforts to change local regulation	.60	.16
31a	Effect of national government on daily life	.56	-.07
16	Understanding of local issues	.54	.11
32a	Effect of local government on daily life	.49	-.09
72f	People like me have no say about government activities	.47	.34
14	Politics and government are too complicated for average man	.35	.24
13a	Extent of avoidance of political discussions	.34	.08
37b	Consideration to point of view by police	.14	.62
37a	Treatment by police	.03	.59
34	Treatment in government office	.05	.59
35	Consideration of point of view by officials	.18	.57
51	Prudence of Republican party policies	.02	.49
52	Prudence of Democratic party policies	-.01	.42
31b	Benefit deriving from national government activities	.22	.40
18a	Elite vs. majority rule	-.16	.39
32b	Benefit deriving from local government activities	.24	.38
72d	Reliability of candidates for public office	.19	.31

ment is making this judgment with reference to a state of affairs that he thinks *should* exist because it is affirmed by the political culture.

Another pair of questions (51 and 52) that load highly on this second component ask for the respondent's judgment as to the likelihood that the policies of either of the major political parties would endanger the country's welfare when that party is in control of the government. These questions refer to a set of norms about the role of political parties. This role includes the expectation that the parties will act with a degree of patriotism, judgment, and knowledge that will ensure the country's security and well-being. Failure to comply with these expectations would likely be perceived as a normative violation of great magnitude. Similar reasoning may be applied to items 31b and 32b. If the effects of governmental actions are such that the public would be better off without them, norms specifying that such activity be in the national wel-

fare will be perceived as having been violated. The remaining two items of the second component (18a and 72d), which concern the influence of people and groups on government actions and the reliability and trustworthiness of elected officials, can also be taken as measures of cynical feelings regarding compliance with certain widely held ideals and norms of the political culture.

Although we do not have a direct measure of the extent to which the norms referred to here are in fact shared, some measure of their importance is indicated by Almond and Verba's finding that, when respondents were asked to mention the "things about this country that you are most proud of," 85% of Americans mentioned aspects of the political system such as the Constitution, political freedom, or democracy. These sources of pride are all strongly associated with the norms of equality, responsibility, and responsiveness which have been suggested here as providing the point of reference for answers to the questions constituting this component. In no other country studied did even as many as half of the respondents mention political characteristics as a source of pride.¹⁹ Because the main theme shared by these questions appears to be the extent to which political leaders and government officials observe important norms of the political culture, the second component is called "perceived political normlessness." The stipulation of normlessness as "perceived" is meant to indicate that the respondent *himself* does not necessarily feel anomie, but rather that he believes that frequent deviations from accepted norms occur *in the political process*. In this sense, this concept is related to the concept of "political cynicism," since the questions used to measure cynicism all appear to have either a legal or an informal norm as an implied referent against which respondents are asked to judge the behavior of politicians.²⁰ It may be a more fruitful concept in that whereas "cynicism" has no apparent theoretical roots, "perceived normlessness" has theoretical ties in the alienation framework and in the Durkheim-Merton-inspired theories of anomie, in which the term is used to signify a devitalization of social norms.²¹

Each respondent was assigned a score on each of the two dimensions of alienation on the basis of his responses to the questions discussed above. A cluster scoring procedure, in which each item is assigned uniquely to the scale on which it has its highest loading, was used. The internal consistency reliability coefficients of the powerlessness and perceived normlessness scales were .77 and .62 respectively.²² Both measures were approximately normally distributed, with a slight positive skew in the perceived normlessness scale. In the interests of greater reliability, a modification in the original sample was made consisting in the elimination of 102 cases for which there were serious data gaps.²³ All analy-

"perceived political normlessness." Inkeles defines political anomie as the individual's *feeling* that others are not complying with the rules of society, and operationalizes it as "the individual's *perception* of the extent to which politicians and government officials pay attention to the common man, serve the public rather than their own careers, and keep their campaign promises after the election." Alex Inkeles, "Participant Citizenship in Six Developing Countries," this REVIEW, LXIII (December, 1969), p. 1125. Emphasis in original. The content of the first and third of Inkeles' defining questions is essentially the same as Qs. 18a and 72d of the perceived political normlessness scale.

²² The Hoyt method was used. See Cyril J. Hoyt and Clayton L. Stunkard, "Estimation of Test Reliability for Unrestricted Item Scoring Methods," *Educational and Psychological Measurement*, 12 (1952), 756-758.

²³ Since multivariate techniques assume a constant N, some procedures had to be adopted to eliminate missing data. The entire sample of 970 was used for the component analyses reported above, with "Not Ascertained" or "Don't Know" cases coded the middle position of continuous variables or the modal position of dichotomies. Once scale composition was determined, cases were excluded from the analysis if more than one-third of the questions comprising either of the dependent variables had missing responses or if information was missing on a major socioeconomic status variable, i.e., occupation or income, since these were known to have important effects on alienation (there were no missing data for education, place of birth, or race). The two-thirds present criterion for the dependent variables was somewhat arbitrary. It seemed likely that with more than one-third of the items missing, there would be a relatively high probability of misrepresenting the respondent's true attitude. Conversely, a more stringent criterion would have eliminated a great

¹⁹ Almond and Verba, *op. cit.*, p. 102.

²⁰ See Agger, *et al.*, *op. cit.*, p. 479, for a list of the questions used.

²¹ See especially Robert K. Merton, *Social Theory and Social Structure* (rev. ed.; New York: The Free Press, 1957), pp. 131-194. Another related concept inspired by Durkheim's analysis of anomie has recently been discussed by Inkeles, who develops the concept of "political anomie" along lines which are strikingly similar to those defining

ses which follow are based on the refined sample of 868 cases.

The examination of the meanings of each of the questions in the two scales suggests that the scales have content validity as measures of the concepts of political powerlessness and perceived political normlessness. The establishment of these two distinct measures of alienation should aid in future theoretical clarification of the concept and in the development of more specific hypotheses relating alienation to various personal characteristics and social conditions. As a step toward this goal, the relationships between these two scales of alienation and a variety of other variables are explored below. Since the two scales are only weakly related ($r = .26$, indicating only 7% shared variance), we can reasonably expect that the two dimensions of alienation will be *differentially* related to other variables. If the strength or the direction of the relationships between the measures of alienation and various social and psychological variables are significantly different, then the utility of the dimensional approach will be further substantiated.

III. CORRELATES OF TWO DIMENSIONS OF POLITICAL ALIENATION

The analyses reported below are directed to the question of the sources of political alienation. In previous studies many different variables have been shown to be associated with one or another type of alienation. Most studies, however, have considered only a limited number of variables and thus the literature is replete

many more cases. These procedures resulted in 119 exclusions, accounted for by 102 individuals. An analysis designed to ascertain the effects of excluding these 102 cases on the representativeness of the sample indicated that the revised sample generally corresponded more closely than the original to a number of census distributions. This was because missing data cases tended to have demographic characteristics similar to those which were overrepresented in the original sample. This finding and the great likelihood of unreliability in attempting to score the missing data cases were primary factors in the decision to remove these cases from the analysis. For a more detailed discussion of some problems raised by missing data and a consideration of alternative methods of handling it, as well as a detailed description of the procedures followed in the elimination of cases reported here, see Ada W. Finifter, *Dimensions of Political Alienation: A Multivariate Analysis*, Unpublished Ph.D. dissertation, University of Wisconsin, 1967, pp. 60-70.

with demonstrations of bivariate relationships between measures of alienation and various personal characteristics. In the present study an attempt is made to consider a wide variety of variables simultaneously, and to evaluate their relative importance in multivariate models. In this way the development of parsimonious theory may be advanced.

Zero-order Pearson correlations among all variables are presented in Table 4.²⁴ For conceptual clarity, the independent variables are arranged in three groups, corresponding to the general concepts of (1) social status, which includes religion, nativity, race, sex, age, education, occupation, and income; (2) social cohesion, which includes marital status, number of children, years of residence in the community where the individual lives, frequency of church attendance, number of organizations to which the respondent belongs, whether the respondent was ever an officer in any of these organizations, an index of political participation, party identification, strength of party identification, and an index of faith in people; and (3) geo-cultural environment, including size of community and region of residence. Codes for all variables are presented in the Appendix.

The zero-order relationships between powerlessness and social status reported here are consistent with the findings of several previous studies which used different indicators of alienation.²⁵ In addition, the Survey Research

²⁴ Bivariate plots between each predictor variable and each alienation scale showed no significant departures from linearity. The relationship between age and powerlessness was the only one which was very slightly curvilinear, with the youngest age group (18-25) having as high a mean powerlessness score as the 41-50 age group, but not nearly as high as that of the oldest group. This result confirms neither previous findings of a linear relationship between these variables, reported by several investigators, nor those findings indicating extreme curvilinearity, with the youngest being more alienated than any other age group. See W. E. Thompson and J. E. Horton, "Political Alienation as a Force in Political Action," *Social Forces*, 38 (March, 1960), 190-195.

^b These dummy variables were constructed from answers to the same item.

Center studies have found consistently that the political efficacy scale (the inverse of powerlessness) is positively related to being male, and to education, income, and occupation.²⁶ Within the cluster of status measures used in the present study, education is by far the single most important predictor of powerlessness, accounting for 19% of the total variance. Because of the important effects of education on job and income opportunities, it is likely that education also has important indirect effects through its influence on occupation and income, each of which is also fairly strongly related to powerlessness. However, since income level of the parental home is an important determinant of the level of education achieved by the respondent, it is difficult to reject the economic determinism hypothesis without more information on socio-economic background than is available in this study. These data do demonstrate, however, that in a contemporaneous prediction of powerlessness, education is a far more important variable than income. Nevertheless, income and occupation each independently explain about 9% of the variance in powerlessness scores. In contrast, income accounts for only about 3% and occupation for about 1% of the variance in normlessness.

Race is another measure of general social status found to be related to indicators of alienation in previous studies.²⁷ In each case, Negroes are more highly alienated than whites. In the present study, although race seems to be of some slight importance in predicting powerlessness ($r = .14$, $r^2 = .02$), its relationship to this form of alienation is essentially a function of education: when educational attainment is

controlled, the strength of the relationship between race and powerlessness drops to less than one-fourth of its initial potency ($r = .067$, $r^2 = .004$). Given similar educational achievement, Negroes apparently feel hardly any more powerlessness concerning the political process than do whites. Moreover, considering that Negroes as a group are less well-educated than whites, that they generally hold lower prestige occupational positions, and that they earn less income, the zero-order correlation between race and powerlessness is perhaps smaller than one would expect.

The low correlation between powerlessness and race contrasts with the stronger effects of race in the case of normlessness. Even when income and education (the two next most powerful status predictors of normlessness) are both held constant, race maintains most of its original explanatory power, with the second order partial reduced only to .175. In contrast, the corresponding second order partial for race and powerlessness is an insignificant .035. This difference means that, given similar achievement status, ascriptive racial status is not important as a cause of political powerlessness, but it does remain an important cause of perceived normlessness. However, since it is obviously more difficult for Negroes to attain that same achieved status, this type of statistical controlling procedure is in danger of being misleading except as it points out possible effects of social change. That is, the implication of these findings is that if opportunities for educational and material advancement were equal, it is likely that Negroes would feel no more powerless than whites. In contrast, race *would* remain the most powerful status variable in determining the perception that public officials commonly violate community norms. Indeed, of all the independent variables considered, race is second in power only to the measure of faith in people for explaining normlessness, and even with this measure of inter-personal trust controlled, race still has a significant effect on normlessness ($r = .16$).

Another ascribed characteristic correlated with perceived normlessness is sex: men perceive norm violations somewhat more frequently than do women. This is the more interesting in view of the fact that women feel more powerless than men. The differential relationship between sex and the two dimensions of alienation indicates the contemporary persistence of the political role traditionally assigned to women. The present findings indicate that many women feel they have little capacity to affect the political system, yet they are less critical of it than are

anomia scale as a measure of alienation. The heavy emphasis on personal life situations in the Srole scale suggests that it may largely measure personal disorganization or maladjustment rather than attitudes toward aspects of social structure. The two may be related, but this is an empirical rather than definitional question, and the indiscriminate use of the Srole scale as a *de facto* measure of "alienation" serves mainly to confuse these concepts. Furthermore, there is some empirical evidence that anomia and some measures of alienation are independent dimensions. See the articles cited in note 10.

²⁶ Angus Campbell, Gerald Gurin, and Warren E. Miller, *The Voter Decides* (Evanston: Row, Peterson and Company, 1954), pp. 190-192; Campbell, et al., *The American Voter*, op. cit., pp. 516-520.

²⁷ See, for example, Middleton, op. cit. and Campbell, Gurin, and Miller, op. cit.

men. This is an important aspect of what has been called the "subject" political orientation.²⁸

Nativity, another ascribed characteristic, also has divergent effects on the two types of alienation. Whereas foreign-born respondents are likely to feel somewhat more powerless than the native-born (and the Southern European feels even more powerless than the northern European), we find that the opposite is true for perceived normlessness. That American birth is associated with lower levels of powerlessness is explicable by the higher educational attainment of native-born citizens, since education decreases feelings of powerlessness. Why then should American birth be associated with *increased* perceptions of normlessness? It will be noted that the nativity ranking orders native-born Americans highest, those born in Northern or Western Europe second, and those born in Southern Europe, or in other areas of the world, lowest.²⁹ This ranking clearly corresponds also to one of similarity of the political system of the country of origin and that of the United States. Similarity of these political systems is likely to be related to greater knowledge of the American system. The reason for the correlation between nativity and perceived normlessness may then lie in the fact that those with greater knowledge of and familiarity with the American political system would be more apt to perceive the norm deviations which do, in fact, occur, than would those to whom the political structure is less familiar.³⁰ Another possible explanation for this finding may lie in the bases from which these judgments are made. The native-born American probably has the highest expectations regarding the behavior of public officials, rooted in an idealized orientation toward government and authority common in public schooling. Violations of this textbook image may thus evoke more negative responses (as in a frustration-aggression reaction). The political culture of the Southern European, to take the other extreme, tends to stress a more realistic and a more cynical image of the workings of government.³¹

²⁸ Almond and Verba, *op. cit.*, esp. Chapters 1 and 8.

²⁹ The ranking of ethnic prestige follows Gerhard Lenski, "Status Crystallization: A Non-Vertical Dimension of Social Status," *American Sociological Review*, 19 (1954), p. 407.

³⁰ Litt found that familiarity with Boston politics (as measured by length of residency in that city) increases political cynicism. Edgar Litt, "Political Cynicism and Political Futility," *Journal of Politics*, 25 (May 1963), 312-323.

³¹ For descriptions of attitudes toward authority in different political systems see Almond and

Given their lower expectations, persons socialized in this type of political culture might therefore be more tolerant of what they may perceive to be the far less frequent occurrence of norm violations in their adopted country.³²

In summary, then, the relationships between the social status characteristics and each of the two dimensions of political alienation differ in several important respects. In particular, Negroes tend to have higher scores on the measure of perceived normlessness than do whites, while the difference between the races on the measure of powerlessness is of much less importance. Both nativity and sex have opposite effects on the two types of alienation. Women tend to feel more powerless than men but less often perceive norm violations. The native-born, in general, feel less powerless than the foreign-born, but the foreign-born are less critical of the operations of the political system.

It is clear that important differences exist also in the effects of various aspects of social cohesion on the two kinds of political alienation. Political participation has a very high negative correlation with feelings of political powerlessness ($r = -.64$), alone accounting for 41% of its variance.³³ The "faith in people" scale, de-

Verba, *op. cit.*, esp. Chapters 4 and 14; Lawrence Wylie, *Village in the Vauchuse* (New York: Harper and Row, 1964), Chapter 10; and David Easton and Robert D. Hess, "The Child's Political World," *Midwest Journal of Political Science*, 6 (1962), 229-246. Easton and Hess comment particularly on the idealization of authority encouraged in American socialization practices.

³² Then, too, it is possible that the foreign-born may be more hesitant to make statements critical of American government to an American interviewer. Since the items in the normlessness scale tend to focus on government officials they may be more threatening in this respect than the items in the powerlessness scale, which may be perceived more in terms of the respondent's own shortcomings.

³³ Although a significant correlation between political participation and powerlessness was expected on theoretical grounds, its magnitude prompted re-examination of the scales to explore the possibility of a spurious effect caused by similarity of some of their questions. Questions 24 and 28 of the powerlessness scale asked for the likelihood that the respondent *would actually try* to do something about a national law or local regulation that he thought unjust. Questions 25 and 29, used in the participation scale, asked if the respondent had actually *ever done* anything to try to influence a national or local decision. The first set is

signed to measure a person's "global attitude toward human nature,"³⁴ also has a strong inverse correlation with feelings of powerlessness ($r = -.37$). Since the faith in people scale is a measure of interpersonal trust in social relations it is understandable that it should be related to

an almost classic operationalization of the definition of an attitude as a predisposition to behavior. Questions 25 and 29, however, ask for reports on *actual behavior*. Thus, the four questions are legitimately placed in their respective scales of *attitude* toward the political system and *actual participation* in it. Nevertheless, in order to avoid any possibility of spuriousness, the powerlessness scale was reconstructed without questions 24 and 28. The reliability of this new scale dropped from .77 to .71 because of the loss of the two items, which had been very highly correlated with the other items of the scale. However, contrary to the spuriousness hypothesis, the correlation between the participation scale and the *new* powerlessness scale dropped only to $-.60$ (from $-.64$). Since the decrease in actual prediction is less than the theoretically possible decrease due to loss of reliability alone, the diminution of the correlation is probably due solely to the decrease in reliability rather than to the omission of these two particular items. If, in contrast, the decrease in correlation had been larger than warranted by the decrease in reliability, the spuriousness hypothesis would have been more plausible. Furthermore, the correlations between these particular items of the two scales were not large enough to have caused the high correlation between the scales themselves, especially in view of the fact that they comprise only 2/7 of the participation scale and 2/11 of the powerlessness scale.

	Powerlessness Questions	
	24	28
	<hr/>	
	25	.36
Participation Questions		
	29	.33

In contrast, the correlation between items 25 and 29 of the participation scale is .47 and between items 24 and 28 of the powerlessness scale .55. This analysis demonstrated that the items contributed far more to the reliability of their respective scales than to any spurious correlation between the scales. On the basis of this evidence the original powerlessness scale was retained because of its higher reliability.

³⁴Morris Rosenberg, "Misanthropy and Political Ideology," *American Sociological Review*, 21 (December, 1956), p. 690. The reliability of this scale in the current project was .58.

the way in which politics, a process involving considerable emphasis on interpersonal activity, is viewed.) A further indicator of social cohesion which has a strong negative relation to powerlessness is the number of organizational memberships the individual reports ($r = -.38$), which is slightly more strongly related to powerlessness than is the experience of having been an officer in these organizations ($r = -.31$). Finally, frequency of church attendance is also negatively related to feelings of powerlessness ($r = -.17$). Considering the relationships *among* this set of variables, the highest correlations exist among organizational memberships, political participation, and faith in people, with church attendance somewhat less strongly related to this cluster. It is perhaps reasonable to postulate the existence of an underlying "community solidarity" factor which operates to reduce feelings of powerlessness. While these activities and attitudes tend to cluster, faith in people, political participation and church attendance have strong independent effects on this type of alienation. However, membership in general voluntary organizations alone, without participation in the political process itself, does not substantially reduce feelings of political powerlessness. The partial correlation between organizational memberships and powerlessness when political participation is controlled reduces to only $-.08$ while the corresponding partial for faith in people is $-.26$ and for church attendance, $-.15$. These results suggest important relationships between political attitudes and the broader context of social interaction.

The participation measures are much less strongly related to perceived normlessness than to powerlessness. For example, neither organizational memberships, nor being an officer, nor political participation (each of which explains between 10% and 41% of the variance in powerlessness) can explain as much as 2% of the variance in the perceived normlessness scores. Thus the pattern of community participation, which tends to decrease feelings of powerlessness with respect to the political process, has practically no effect on whether or not one perceives norm-violating behavior by government officials. Frequent participators appear almost as likely to perceive such behavior as apathetics. Faith in people, however, is equally powerful in predicting both types of political alienation. This variable is, in fact, the most powerful of all independent variables in predicting perceived normlessness, accounting for 15% of the variance.

The "social cohesion" variables present certain problems of conceptual status. They are related to each other in complex ways that must

eventually be explicated if adequate causal models are to be developed. In addition, they are related to the measures of alienation more complexly than the simple independent-dependent variable model of regression analysis used here suggests. For example, participation variables have been treated in the literature as both independent and dependent with respect to political attitudes. Campbell and his associates consider political efficacy as an independent variable in predicting levels of political participation,³⁵ and Horton and Thompson,³⁶ Janda,³⁷ and Aberbach³⁸ consider the effects of political alienation on voting behavior. Agger and associates have shown that their political cynicism measure is related to frequency of political discussion,³⁹ a finding similar to one by Douvan relating "political effectiveness" to political discussion.⁴⁰ On the other hand, analyses by Rose and Almond and Verba are distinguished by their emphasis on organizational affiliations as *preceding* feelings of competence,⁴¹ while competence itself is viewed as a *product* of the diffusion of group values to the members. It has also been suggested that feelings of efficacy and actual participation probably reinforce each other. Some sense of subjective competence may precede participation, but the skills and familiarity with the political process that result from participation are likely, in turn, to increase the subjective sense of ability to influence the system.⁴² It seems clear that a complex feedback process exists among these variables. Development of an

adequate theory of alienation will depend on the success with which these types of variables are incorporated in their dual role as both cause and effect of attitudes. Newly developing techniques for analyzing reciprocal causal models hold promise for reaching this goal.⁴³

This discussion has proceeded with a separate consideration of variables on different levels of analysis. Status variables may be considered as relatively stable (indeed, some are immutable) characteristics of the individual. Community cohesion variables, on the other hand, are dynamic characteristics of the individual as he relates to others in his environment. We may also consider the effect of certain characteristics of the environment itself. Being from either the Northeastern or the Southern region of the country is related to one's level of both powerlessness and perceived normlessness, but the regional characteristics have opposite effects. As compared to Southerners, Northeasterners appear to feel more confident of their ability to understand and influence government decisions and of the normative compliance of political leaders. The correlations between community size and the two types of alienation indicate that this lesser alienation in the Northeast is not due to the higher urbanization in this area. Indeed, as will be discussed below, the correlations between community size and both forms of alienation increase positively when controlled for certain relevant variables. The relationship between region and alienation may be viewed as a reflection of the generally lower socioeconomic status of persons living in the South. When either education or income is controlled, the relationships between being from the South and both of the alienation variables are reduced. However (as in the case of the relationship between race and alienation), one may question the validity of controlling for such variables, since this procedure tends to obscure the historical factors which have made the South a distinctive region.

IV. MULTIVARIATE MODELS

A large number of variables have been considered, and an attempt has been made to identify those whose effects are most important. Obviously, however, there is an extremely large number of ways in which these variables could be

combined to form prediction equations. From the enormous number of possible equations it is desirable to be able to select one model on which substantive explanations could be focused. The problem of choosing an explanatory model may be interpreted as one of striking a balance between maximizing explanatory power and minimizing the number of variables included so as to achieve theoretical parsimony. In order to find such an optimal equation, a stepwise correlation program was used.⁴⁴ The criterion adopted for termination of the equation was that the increase in R^2 resulting from the addition of a variable be statistically significant at the .05 level. This criterion increases confidence that an increment in explanatory power of a given size is unlikely to have happened because of sampling or other random error (within the usual confidence limits), and that the variable in question makes a genuine contribution to explanation.

Table 5 presents the regression coefficients for the two equations that meet this criterion. First, it should be noted that the full twenty-three variable equation increases explained variance in powerlessness from 50.7% to only 51.5% and in normlessness from 17.9% to only 18.9%. Thus, it seems clear that, in each case, the stepwise regression procedure has permitted the selection of a relatively small subset of variables (less than one-third of those originally available), whose power is such as to explain 98% and 95%, respectively, of the variance controlled by the full set of variables. In both cases, also, explanation of variance increases only marginally over and above the explanation possible with the one most powerful predictor alone. In the case of powerlessness, explained variance increases from 41% to 51% with the addition of six variables to political participation and for normlessness from 13% to 18% with the addition of six variables to faith in people. While beginning with different initial variables in each case would result in slight changes in these figures, the important point, *normally obscured by successive bivariate analyses*, is that the variables with which we typically work are often sufficiently inter-related so that we do not actually increase explanatory power greatly by con-

tinually increasing the number of predictor variables.⁴⁵ Thus, determination of the most powerful explanatory variables appears to be a rational and useful research strategy.

Considering the powerlessness model first, a comparison of the standardized regression coefficients indicates that political participation is by far the most important predictor. The appearance of community size may seem strange in that, of all variables, this one had the lowest zero-order correlation with the dependent variable. An examination of the stepwise calculations reveals that the major impetus to the rise in the partial correlation between population size and powerlessness was the inclusion of education. With education controlled, this correlation increases (partial $r = .06$), indicating that

⁴⁴ On the other hand, this very inter-relatedness may lead to difficulties in obtaining stable estimates of regression coefficients. As Farrar and Glauber suggest, the problem of multicollinearity is most usefully viewed as one of degree of severity rather than as one of categorical existence. The size of the correlation coefficients among the independent variables in the present study does not appear to constitute a serious problem. See Donald E. Farrar and Robert R. Glauber, "Multicollinearity in Regression Analysis: The Problem Revisited," *Review of Economics and Statistics*, 49 (1967), 92-107.

⁴⁴ The particular program used was "BMDO2R, Stepwise Regression." For a description of this program, see W. J. Dixon (ed.), *BMD Biomedical Computer Programs*, revised edition (Los Angeles: Health Sciences Computing Facility, Department of Preventive Medicine and School of Health, School of Medicine, UCLA, September 1, 1965), pp. 233-257.

within educational levels, there is a weak but significant positive relationship between community size and feelings of political powerlessness. Large urban concentrations apparently do contribute to a sense of estrangement between the citizen and his government. This relationship is suppressed at the zero-order level because of the tendency of highly educated individuals to locate in larger cities and the negative relationship between education and powerlessness. The alienating effects of the urban environment do not appear to result from differential social cohesion in rural and urban areas. There are few important correlations between community size and the measures of social cohesion used in the present study and the direction of those which do exist is not consistent with the hypothesis that the reason for higher alienation in larger cities lies in lower social cohesion. If no distinct urban behavior patterns can be implicated in the positive relationship between community size and powerlessness, it is possible that type of political structure may be a useful concept in future investigations of this phenomenon.

The inclusion of age in the final regression equation also merits examination. Significant events accompanying the aging process, such as loss of spouse and enforced retirement from gainful employment, probably increase personal frustration. It may be that these feelings of frustration or helplessness are generalized to the political realm, thereby increasing the sense of political powerlessness. But such a higher level of alienation among the aged is partly obscured at the zero-order level by the *positive* correlation between age and political participation ($r = .11$). The multivariate model points up the importance of higher political participation in keeping political powerlessness among the aged at a lower level than it would otherwise reach. Indeed, as the effects of other integrating variables are held constant, the effect of age becomes increasingly strong and clear. For example, with political participation, education, and faith in people controlled, age is a more powerful predictor of powerlessness than it was at the zero-order level (partial $r = .14$).

Considering now the final equation for predicting perceived *normlessness*, there are several interesting comparisons between the set of predictor variables included here and those included in the equation for powerlessness. Most noteworthy is the absence in this equation of the single most important variable in the powerlessness equation, political participation. Cynicism about the behavior of public officials is evidently sufficiently persistent that participation, even in the political process itself, does not serve to reduce it substantially. Education, age, and being

Jewish, all of which influence the degree of powerlessness, are also absent from the perceived normlessness model. Conversely, three ascribed status characteristics (sex, race, and nativity) which had less important effects on levels of powerlessness and were not included in the final equation for that variable, are relatively important among the predictors of perceived normlessness. Men are more likely to be critical of the political system, as are Negroes and those born in this country. Two separate but related explanations seem necessary to account for these findings. Men, being more attentive to politics than women, may be more aware of norm violations that occur in the political process. This is essentially the argument that was offered above to explain the positive relationship between prestige of birthplace and normlessness. However, Negroes may score higher than whites on this type of alienation precisely because they are the *objects* of the unfair treatment which is an important part of the definition of normlessness.

In contrast to the absence of measures of secular participation in the model for normlessness, religious participation (church attendance) appears in both equations. Population of place of residence is another variable which shows a small but persistent influence on both modes of alienation.

The most important variable in predicting perceived normlessness is faith in people. Since interpersonal confidence was also important for explaining powerlessness, this finding might be read to imply that political alienation is merely a derivative expression of a general personality characteristic that could be expected to have similar manifestations in other spheres. However, studies demonstrating inchoate attitudes toward politics in young children⁴⁶ suggest that the development of these attitudes does not wait on a well-formed structure of attitudes toward social relations in general, but may occur at the same time as more generalized attitudes are formed.⁴⁷ The pattern of intercorrelations

⁴⁶ See, for example, David Easton and Jack Dennis, "The Child's Image of Government," *The Annals of the American Academy of Political and Social Science*, 361 (September, 1965), 40-57; Fred I. Greenstein, *Children and Politics* (New Haven: Yale University Press, 1965); and Robert D. Hess and Judith V. Torney, *The Development of Political Attitudes in Children* (Chicago: Aldine Publishing Company, 1967).

⁴⁷ Verba suggests that attitudes toward specific political issues may develop *before* more coherent or inclusive ideologies. See Sidney Verba, *Small Groups and Political Behavior* (Princeton: Princeton University Press, 1961), pp. 41-42.

among faith in people, the alienation scales, and several of the status variables suggests that fundamental attitudes of trust or cynicism with respect to the motives of other people, as well as attitudes toward particular social institutions, may be transmitted as part of class sub-cultures. The correlation between income and normlessness, for example, is higher than would be expected on the basis of a developmental sequence leading from income to faith in people to perceived normlessness (the predicted r is $-.11$; the observed r is $-.18$). On the other hand, the relationship between faith in people and perceived normlessness is far too high to be a spurious product of the correlations between income and faith in people and income and normlessness (the predicted r is $-.05$; the observed r is $-.37$). It seems likely, therefore, that attitudes toward specific social institutions and generalized attitudes toward human nature develop concurrently and in interaction with each other.

V. SUMMARY OF FINDINGS

In recent discussions of alienation a variety of meanings have been distinguished, such as powerlessness, normlessness, meaninglessness, and isolation. The present analysis began by considering the ways in which these modes of alienation may be useful in exploring attitudes toward the political system. Empirical measures of two of these types of political alienation were developed. The high level of prediction achieved using the powerlessness scale as a dependent variable suggests that its use in future research would be worthwhile. An important further step would be to continue the establishment of the predictive validity of the measure by studying the types of political behavior that tend to be associated with varying degrees of powerlessness. For example, some research has demonstrated that it is useful to dimensionalize political participation itself;⁴⁸ we may therefore find that varying levels of powerlessness tend to be associated with different *types* of participation, rather than merely with different *degrees* of participation considered as a global behavior. We will return to this question below. In comparison with the powerlessness results, explanation of variance in the perceived normlessness scale,

while still substantial, is much lower. One reason for this may be the lower reliability of this scale which imposes a lower ceiling on predictability. Increasing the reliability of the scale, perhaps by adding more items, for example, may improve prediction.

An important consideration in improving our understanding of both types of alienation is the need for variables that simply are not measured in the present study. If alienation is at least partially a function of social experience, it is obviously imperative to consider the kinds of experiences people have with the political system and the responses they have received to their own or their peers' efforts to participate. The addition of contextual variables, such as characteristics of local political structures, to the predictive models would also be necessary in order to examine the relationship between political reality and individual attitudes. Of tremendous utility also would be the incorporation of significant political events as natural experimental variables in research programs that permit repeated measurements on the same or related study populations. In these ways an assessment of the effects of political conditions on the development of attitudes of alienation could be approached.

An important finding of this study is that there are some significant differences in the variables that are associated with each type of alienation. (Individuals with high powerlessness scores are unlikely to participate in community activities, whether secular or sacred. They are likely to be older, to have less education, and to have low faith in people.) Conversely, living in smaller communities or being Jewish are characteristics that tend to reduce this type of alienation. High scores on the perceived normlessness scale are most likely for individuals with low faith in people, who are native-born, Negro, male, have low income, live in large cities, or attend church infrequently. Since education and income are related, the fact that education appears in the powerlessness equation and income in the normlessness equation should not be stressed greatly unless additional research confirms this difference. Nevertheless, the difference is theoretically interesting. The sense of injustice of the poor, reflected in their higher scores on perceived normlessness, may be partially mitigated by the fact that it is not the poor *per se* who feel most powerless, but rather the poorly educated. That education and income are not completely overlapping stratification variables (i.e., that the class system is not a caste system) prevents the intensification of the sense of alienation that might otherwise exist in the lower social classes.

There is a group of characteristics, however,

⁴⁸ See W. S. Robinson, "The Motivational Structure of Political Participation," *American Sociological Review*, 19 (1952), 151-156 and Bernard M. Finifter, "Styles of Participation in Political Life: Differential Multivariate Prediction with and without Allowance for Interaction Effects," paper presented to the Midwest Society of Multivariate Experimental Psychology, Chicago, May, 1968.

which tend to be associated with *both* types of alienation. These are low faith in people, infrequent church attendance, and large city size. This cluster of variables may be an appropriate indicator of the impersonality of contemporary life which so many analysts have indicted as a major source of all types of alienation. The significant *differences* in predictors of the two types of alienation involve political participation, age, sex, nativity, and race. Results obtained in this study leave little doubt that participation in the political process is far more important in reducing powerlessness than in its effect on normlessness. In fact, there is some suggestion that participation may tend to increase perceptions of normlessness. Although participation and perceived normlessness are negatively related at the zero-order level, the regression coefficient for participation in the complete twenty-three variable equation for normlessness is positive (and tracing this value during the stepwise procedure indicates that it is consistently positive after faith in people is controlled at the second step). This finding is suggestive only, since political participation does not contribute at a statistically significant level to the explanation of perceived normlessness. However, the fact that men and native-born citizens (both of which characteristics are significantly associated with participation) have higher normlessness scores than do women and the foreign-born (who participate less) strengthens the implication that high scores on normlessness are partially a function of knowledge and experience with the political system.⁴⁹

VI. ALIENATION AND THE POLITICAL SYSTEM

Because the dimensional approach to political alienation clarifies and specifies attitudes toward the political system, it may be a useful basis for the development of more specific hypotheses regarding the effects of attitudes on political behavior. The concluding section of this paper is devoted to a brief and admittedly speculative exploration of some types of political engagement which may be associated with different combinations and levels of the dimensions of political alienation. My purpose in this discussion is to illustrate how this approach to developing

concepts and measures can be useful in suggesting research hypotheses that address themselves to the larger theoretical problems of change and stability in political systems.

Alienation is commonly regarded as a threat to the survival of the political system. If we examine the relationships between alienation, political behavior, and the states of political systems more closely, however, it is reasonable to suggest that not all types of alienation need be viewed as necessarily "dysfunctional." To the extent that alienated individuals are non-participants, for example, Berelson has suggested that they serve to soften and blur crippling divisions in the body politic that may result from extreme political conflict.⁵⁰ This suggests the hypothesis of a positive relationship between political participation and debilitating system cleavages, at least above a certain critical level of participation. Thus, in Berelson's view, the contribution of apathy to a political system is to permit the maintenance of its usual decision-making patterns. However, the persistence of a political system, in the sense of a shared normative structure, is not necessarily dependent on the perpetuation of a particular set of existing political institutions. Indeed, conflicts often exist between basic normative patterns and particular political institutions. When such conflicts are recognized, political institutions may be deliberately changed to conform to the basic normative patterns. The recognition of such conflicts between basic norms and particular political institutions is an important source of political change. As Geertz points out, it is in the incongruities between cultural patterns and social organization that "we shall find some of the primary driving forces in change."⁵¹

Applying this culture-structure differentiation to the results of the present research, I have suggested that to those scoring high on perceived normlessness, important aspects of the political culture (such as equality of citizens and responsibility of office holders) appear to be violated by the political structure, that is, by actual behavior of office holders or aspects of the political process itself. Systemic stresses that may be created by the behavior of persons who so perceive the political system (such as protest marches, strikes, etc.) are frequently directed toward reducing the inconsistency between the

⁴⁹ Results of an analysis of interaction effects provide some further support for the suggestion that political participation may increase perceived normlessness. The analysis identified a small but theoretically interesting sub-group ($N = 56$) of white, mobile, college-educated people with high faith in people among whom higher political participation is associated with higher alienation: Ada W. Finifter, *op. cit.*, pp. 144-151.

	Low	<i>Apathy</i> Very low level of political involvement	<i>Political Integration</i> Conformative participation

political culture and the structures by which it is implemented. It is difficult to classify such behavior using the customary language of functionalism. Protest behavior patently does not appear to be "functional." However, insofar as protest can act as a catalyst for needed social change, it is similarly awkward to classify it as "dysfunctional." It is precisely this opposition of "functional" and "dysfunctional" which has contributed to the criticism that the functional mode of analysis has overemphasized the *status quo* and failed to provide any substantial theoretical basis for dealing with social change.⁵² As a partial response to this need, it may be useful to introduce a new typological concept to describe conditions involving system disturbances that may culminate in higher levels of integration in social systems (as, for example, by narrowing gaps between cultural patterns and social organization). The concept "orthofunctional"⁵³ is suggested to describe such conditions. Thus, this concept might be useful to describe systemic stresses that, while initially disruptive, generate increasing system integration by the modification of conditions that violate widely-shared norms or otherwise inhibit intra-system cohesion.

Feelings of powerlessness may be considered

⁵² See, for example, Lewis Coser, *The Functions of Social Conflict* (New York: The Free Press, 1956), pp. 15-31; and Wayne Hield, "The Study of Change in Social Science," *British Journal of Sociology* (March, 1964), 1-11.

⁵³ From the Greek "orthos," to straighten, correct, or make right, as in orthopsychiatry, orthopedics, etc. As an analytic concept, "orthofunctional" is not intended to increase the *explanatory* power of a functional analysis. See A. James Gregor, "Political Science and the Uses of Functional Analysis," this REVIEW, LXII (June, 1968), 425-439.

"functional" in permitting the orderly maintenance of the *status quo*; perceptions of normlessness may be considered "orthofunctional" insofar as they may lead to demands for greater compliance with legal or cultural norms. If this interpretation of normlessness is plausible, it follows that people may perceive a condition of political normlessness precisely because of their *allegiance* to a set of ideals to which the community formally adheres, but which are commonly violated. The civil rights revolution, and the student and Vietnam war protests are based in large part on perceptions of violations of culturally accepted norms and demands on the political system for compliance and rectification. Such demands may be temporarily disruptive, but can be viewed as orthofunctional in that they may lead to adjustment and correction of system deviations from cultural norms.

The possibility that various types of alienation may have different consequences for political systems is a major reason for separately investigating their correlates, but it is also a compelling reason for studying their interrelationships. The findings of the present research indicate a substantial amount of independence between the alienation dimensions of powerlessness and perceived normlessness. This relatively weak relationship suggests a classification combining different levels of these two dimensions. Insofar as political behavior depends on modes and levels of political alienation, a provisional typology combining alienation and types of political engagement can be proposed (see Figure 1). This paradigm is highly tentative, and is intended to suggest some directions and hypotheses for future research on the relationship between alienation and political activation rather than to report on or synthesize research already accomplished.

Of the four cells, the types of political ac-

tion associated with relatively low levels of perceived normlessness (i.e., the lower two quadrants) have been most extensively explored. The heavy reliance on random sampling of the general public in political behavior research has perhaps made this inevitable. These styles of participation are of the conventional "middle class" conformative type, including activities such as voting and attending to the mass media.⁵⁴ These kinds of activities tend to support existing political institutions.

Moving to the upper two quadrants, the probability that normlessness will be orthofunctional is likely to be at its highest when perceptions of norm violations are combined with a low sense of political powerlessness. Many reform-oriented protest group activities, such as those of CORE or the Southern Christian Leadership Conference, and many domestic agrarian movements, such as the National Farmer's Organization, would fall in this category. The goals of these groups are directed at correcting specific social conditions that impede the integration of certain sub-groups into the system as a whole. In this sense their activities can be thought of as orthofunctional even though they may create serious temporary disturbances in system equilibrium. Individuals who participate in these types of groups feel that the system is at least potentially responsive to their efforts. Those engaging in activities suggested in the upper left quadrant, on the other hand, have probably given up hope that the political system will ever be responsive to their demands. The combination of high perceived normlessness and high levels of political powerlessness seems likely to lead to fundamental, radical rejection of established methods of accomplishing political goals.⁵⁵

⁵⁴ See David Riesman and Nathan Glazer, "Criteria for Political Apathy," in A. W. Gouldner (ed.), *Studies in Leadership* (New York: Harper and Brothers, 1950), pp. 505-559, for this characterization of most activities used by social scientists as measures of political participation. The current "participation revolution" makes this characterization even more telling today than it was in 1950.

⁵⁵ Some substantiating evidence for this hypothesis lies in Ransford's finding that among Negroes in the Watts area, infrequent contact with whites was related to willingness to use violence under the two conditions of a high sense of powerlessness and a high dissatisfaction with treatment received as Negroes. See H. Edward Ransford, "Isolation, Powerlessness, and Violence: A Study of Attitudes and Participation in the Watts Riot," *American Journal of Sociology*, 73 (March, 1968), 581-591.

Whether this rejection is manifested in total withdrawal from political activities or in revolutionary activity will likely depend on opportunities for political activation or on certain personal characteristics. For example, previous research has demonstrated a moderately strong relationship between ego strength and sense of political efficacy.⁵⁶ Since we would expect low ego strength to conduce to withdrawal rather than to revolutionary activity, the revolutionaries of the upper left quadrant may come from that small minority of individuals who feel highly powerless politically but yet maintain a strong sense of *personal* efficacy. Opportunities for political activity may further limit the behavior of those in this group. Similarly, other variables will affect the behavior suggested for other combinations of alienation, but the activities suggested may be significant trends.

The kinds of political movements suggested as possible consequences of high perceived normlessness are similar to the "value-oriented" (revolutionary) and "norm-oriented" (protest) movements distinguished by Smelser.⁵⁷ Value-oriented movements are concerned with basic changes in the nature of man and society while norm-oriented movements are based on less ambitious desires for the restoration or modification of particular social norms. Thus value-oriented movements are comprehensive in their goals while norm-oriented movements seek to make incremental or adjustive changes only. The typology posited above suggests that value-oriented movements are more likely when individuals not only perceive gross violations of political norms but also feel highly powerless to affect the political system. Where feelings of powerlessness are not so strong, it is hypothesized that norm-oriented movements will dominate attempts at political change.

That the correlation between these two dimensions of alienation is fairly low means that the coincidence of extremely high levels on both is likely to be relatively infrequent. Thus, we would expect that the type of threat to orderly system change represented by revolutionary movements will be correspondingly rare, *unless large numbers of people are drawn from the lower left and upper right quadrants into the upper left*. While the research reported here has investigated some sources of powerlessness and perceived normlessness, the conditions under

⁵⁶ Campbell, *et al.*, *The American Voter*, pp. 516-518.

⁵⁷ See Neil J. Smelser, *Theory of Collective Behavior* (New York: The Free Press of Glencoe, 1963).

which these attitudinal orientations *change* remain to be illuminated.⁵⁵ Although it appears likely that recruits to the high powerlessness, high perceived normlessness quadrant come mainly from those already highly alienated on one dimension, there may be certain conditions which draw even those normally not alienated in either way to this state of extreme disengagement. The nature of the general population sam-

ple used in this research precludes adequate representation of the type of political posture associated with the joint occurrence of high powerlessness and high perceived normlessness. Nevertheless, systematic knowledge about this type of political activity and its associated attitudinal structure is vitally needed. Although it was possible in the present study to operationalize only two of the four proposed modes of political alienation (and further research may uncover additional types as well), the great popular unrest evident throughout the world today indicates that intensive exploration of the entire alienation domain constitutes a challenge of the highest priority for empirical political theory.

⁵⁵ For some interesting ideas on the subject of change in basic political attitudes, see William A. Gamson, *Power and Discontent* (Homewood, Illinois: The Dorsey Press, 1968), esp. pp. 172-183.

6. Nativity (Q. 1a)	1 = S. Europe; 2 = N. Europe; 3 = United States
7. Race (Q. 91)	1 = Negro; 0 = White
8. Sex (Q. 90)	1 = Female; 0 = Male
9. Age (Q. 85)	Ascending Order, 1 to 7
10. Education (Q. 61)	Ascending Order, 1 to 8
11. Occupation (Q. 74)	Ascending Order of Prestige, 1 to 9
12. Income (Q. 86)	Ascending Order, 1 to 8
13. Marital Status (Q. 4a)	1 = Single, Divorced, Widowed, Separated; 2 = Married
14. Number of Children (Q. 4b)	Ascending Order, 1 to 6
15. Years Residence in Community (Q. 2)	Ascending Order, 1 to 6
16. Frequency of Church Attendance (Q. 84b)	Ascending Order, 1 to 5
17. Number of Organizations (Q. 83)	Ascending Order, 1 to 5
18. Officership (Q. 83c)	1 = Has been an officer; 0 = Has never been an officer
20. Party Identification (Q. 38)	1 = Democrat; 2 = Independent; 3 = Republican
21. Strength of Party Identification	1 = Independent; 2 = Weak; 3 = Strong
23. Population of Community (Q. 88)	Ascending Order, 1 to 6
24. Northeast (Q. 89)	1 = New England or Middle Atlantic States; 0 = Other States
25. South (Q. 89)	1 = South Atlantic and East South Central States; 0 = Other States
19. Political Participation Index*	
11a. Do you follow the accounts of political and governmental affairs?	
12. What about talking about public affairs to other people?	
25. Have you ever done anything to try to influence a local decision?	
29. Have you ever done anything to try to influence an act of Congress?	
38d. Have you ever been active in a political campaign? That is, have you ever worked for a candidate or party, contributed money, or done any other active work?	
44. What about the campaigning that goes on at the time of a national election: Do you pay much attention to what goes on, just a little, or none at all?	
83d. Are any of the organizations you belong to in any way concerned with governmental, political, or public affairs? For instance, do they take stands on or discuss public issues or try to influence government actions?	

22. Faith in People Index*

- 7. Some people say that most people can be trusted. Others say you can't be too careful in your dealings with people. How do you feel about it?
- 21. Speaking generally, would you say that most people are more inclined to help others, or more inclined to look out for themselves?
- 72b. If you don't watch yourself, people will take advantage of you. (Agree-Disagree)
- 72e. Human nature is fundamentally cooperative. (Agree-Disagree)
- 72h. No one is going to care much what happens to you, when you get right down to it. (Agree-Disagree)

* Codes for individual questions were arranged in ascending order of the concept being measured and were summed for the total score. The Political Participation Index ranged from 0 to 13; the Faith in People Index ranged from 0 to 10.

PEASANT SOCIETY AND CLIENTELIST POLITICS*

JOHN DUNCAN POWELL

Tufts University

I. ELEMENTS OF THE PATRON-CLIENT RELATIONSHIP

The basic social relations of peasant life are directly related to an environment characterized by extreme scarcity. The major factor of productive wealth in agriculture is land, to which the peasant has little or no free access. Labor—his own, and that of his family members—is available to the peasant, but this relatively unproductive factor must be applied to land in order to generate wealth. Few other outlets for productive labor employment are available to him. When the peasant is able to combine land and labor in a wealth-generating endeavor, his productivity is likely to be extremely low, due to limiting factors such as technology, capital, marketing information, and credit. All of these life aspects combine to hold down the peasant's income and preclude savings. He is, in a word, poor.

Furthermore, the peasant is powerless against many threats which abound in his environment. There are disease, accident, and death, among the natural threats. There are violence, exploitation, and injustice at the hands of the powerful, among the human threats. The peasant knows that this environmental constellation is dangerous. He also knows that there is relatively little he can do about his situation, and, accordingly, his culture often features themes of vulnerability, calamity, and misfortune.¹ As George Foster has neatly summarized if, the outlook this situation engenders in the peasant is the "Image of

*I am grateful for the support of the Center for International Affairs, Harvard University, during the development of this analysis; and I wish to thank the many individuals who were helpful at various stages of its preparation, including Professors James Kurth, Joan Nelson, Samuel Huntington, and various members of the joint Harvard-MIT faculty Seminar on Political Development to whom the original version was presented in 1968. An intermediate version of this essay was presented at the convention of the American Political Science Association in New York, September, 1969.

¹Consider the interesting results of Thematic Apperception Tests given to peasant respondents in Southern Italy, reported in Edward Banfield, *The Moral Basis of a Backward Society* (New York: Free Press, 1958), ch. 6.

the Limited Good." Within this image:

peasants view their social, economic, and natural universes—their total environment—as one in which all of the desired things in life such as land, wealth, health, friendship and love, manliness and honor, respect and status, power and influence, security and safety, *exist in finite quantity and are always in short supply* as far as the peasant is concerned. Not only do these and all other "good things" exist in finite and limited quantities, but in addition *there is no way directly within peasant power to increase the available quantities.*²

But there are basic patterns of social relations which develop in peasant societies in order to cope with these realities. They are, in general, anxiety-reduction behaviors by which the peasant attempts to build some security in the face of his perceived environmental threats, or at least to make life more tolerable within a basically threatening context.³ These social arrangements are adaptive means for increasing the peasant's access to the "good things" in life, and, as Foster implies, they are, of necessity, indirect. One basic set of such arrangements is found in the various kinship systems—nuclear families, extended families and clan organizations.⁴ An extension of such arrangements may be found in the fictive kinship relationships present in many peasant societies.⁵ Finally, there are a number of typical peasant social

⁵*Peasant Society, op. cit.*, contains reprints of several good articles dealing with fictive kinship systems and their effects, including Sidney Mintz and Eric Wolf, "An Analysis of Ritual Co-Parenthood (*Compadrazgo*)," pp. 174–199, and Mary Hollenstainer, "Social Structure and Power in a Philippine Municipality," pp. 200–212.

mechanisms which function to "equalize poverty" by means of individual, group, or even institutional actions—the latter, typically, through rituals of conspicuous consumption.⁶

One of these patterns of cooperative social arrangement I wish to treat in detail: *the extended patron-client relationship, or clientele system*. Such a relationship, involving an interchange of noncomparable goods and services between actors of unequal socio-economic ranks, is of profound importance when extended beyond the confines of the peasant community. An extended patron-client network, or clientele system, is important in two distinct ways: one, in its consequences for the political system in which it concretely manifests itself; and two, as an heuristic device for the understanding of a wide range of political behavior which political scientists, in the main, consider to be either pathological, deviant, or of minor import. I refer to patterns of political behavior such as nepotism, personalism, or favoritism; and political structures such as cliques, factions, machines, and patronage groups, or "followings." A fuller understanding of clientele systems, I believe, will render such phenomena more intelligible and significant.⁷

At the core of the patron-client relationship lie three basic factors which at once define and differentiate it from other power relationships which occur between individuals or groups. First, *the patron-client tie develops between two parties unequal in status, wealth and influence*; hence the most apt description by Pitt-Rivers, who called the patron-client bond a "lopsided friendship."⁸ Second, *the formation and maintenance of the relationship depends on reciprocity in the exchange of goods and services*. Such mutual exchanges involve noncomparable goods and services, however. In a typical transaction, the low-status actor (client) will receive material goods and services intended to reduce or ameliorate his environmental threats; while the high-

status actor (patron) receives less tangible rewards, such as personal services, indications of esteem, deference or loyalty, or services of a directly political nature such as voting. Third, *the development and maintenance of a patron-client relationship rests heavily on face-to-face contact between the two parties*; the exchanges encompassed in the relationship, being somewhat intimate and highly particularistic, depend upon such proximity. These three characteristics of the patron-client pattern—unequal status, reciprocity and proximity—hold whether the parties are individuals, which is often the case, or kinship groups, extended kinship groups, informal or formal voluntary groups, or even institutions. *It is important to note that patron-client ties clearly are different from other ties which might bind parties unequal in status and proximate in time and space, but which do not rest on the reciprocal exchange of mutually valued goods and services—such as relationships based on coercion, authority, manipulation, and so forth*. Such elements may be present in the patron-client pattern, but if they come to be dominant, the tie is no longer a patron-client relationship.⁹

Within many rural communities the patron status is highly correlated with land-ownership and the client status with poor cultivators dependent upon the patron's land for their livelihood. Here is how one anthropologist describes such a "traditional" relationship between landlord and sharecropper:

A peasant might approach the landlord to ask a favor, perhaps a loan of money or help in some trouble with the law, or the landlord might offer his aid knowing of a problem. If the favor were granted or accepted, further favors were likely to be asked or offered at some later time. The peasant would reciprocate—at a time and in a context different from that of the acceptance of the favor, in order to de-emphasize the material self-interest of the reciprocative action—by bringing the landlord especially choice offerings from the farm produce, or by sending some member of the peasant family to perform services in the landlord's home, by refraining from cheating the landlord, or merely by speaking well of him in public and professing devotion to him.¹⁰

¹⁰ Sydel Silverman, "The Community-Nation Mediator in Traditional Central Italy," in *Peasant Society*, *op. cit.*, p. 284.

community, that similar patron-client relationships could be established by persons who were not personally linked to a powerful figure through the agricultural system, but were merely lower-status persons who lived in the community: "The potential client would approach one of the *signori* with a request, or he might attempt to establish the relationship first by presenting him with some small gift or by making himself available to run errands or help out in various ways."¹¹ An important aspect of these relationships is that the needs of the client tend to be critical—for example, a peasant may need more land to farm in order to feed his growing family—while the needs of the patron, while important to him, tend to be marginal. Not only can a large landowner get along without the esteem or loyalty of an individual peasant and his family, but there are many more peasant families with needs than there are patrons with assets. The bargaining power of the patron is by definition greater than that of the client.

Several aspects of the patron-client relationship are fixed—such as unequal status, reciprocity and proximity—and some are variable. We should take note of these variables in the relationship before proceeding to the extension of these relationships beyond the confines of the peasant community. The first variable is the origin of the initiative to establish the relationship. Either patron or client may take the initiative. This is less important in enduring relationships than in *ad hoc* or periodic patron-client ties. Duration or persistence over time, then, is a second variable. Third, the scope of the relationship may vary. A patron-client tie may cover the full range of the client's needs, if he is fortunate—from the cradle to the grave, as it were. Other relationships may be defined by the very narrow range of goods and services which are exchanged. Finally, the patron-client tie may vary in its intensity. Affect, feelings of loyalty, obligation, and satisfaction with the benefits of the relationship may be strong or weak. These variables, furthermore, tend to cluster together in distinct patterns. In a "traditional" village—isolated, with few market-network or governmental ties with the outside—patron-client relationships tend to be enduring, extensive and intense. In a more integrated, differentiated village context, patron-client relationships tend to be periodic, defined by special, narrow interests, and casual.

II. LINKAGES WITH THE LARGER SYSTEM

This brings us to a most crucial point in the analysis—the linking of the "little community"

¹¹ *Ibid.*, p. 285.

with the larger socio-economic system in which it exists. Two underlying processes are largely responsible for the establishment of these linkages: state centralization and market expansion.¹² Each involves differentiation and specialization of roles and the elaboration of networks of interdependent parts, or more simply put, transaction systems. At the boundary of the little community stands the "gatekeeper"—the landed patron.¹³ As the twin processes of state and market penetration of the peasant village occur, the patron becomes transformed into a broker mediating the impact of the larger society on peasant society.

As a result of increased attention to the interpenetration of present-day peasant cultures and national cultures over the past twenty years or so, the anthropological community has become increasingly aware of these brokers, "hinge groups," "mediators" or "buffers," as they have been portrayed in the literature. Eric Wolf's original definition of brokers will serve us nicely:

... they stand guard over the critical junctures and synapses of relationships which connect the local system to the larger whole. *Their basic function is to relate community-oriented individuals who want to stabilize or improve their life chances, but who lack economic security and political connections, with nation-oriented individuals who operate primarily in terms of complex cultural forms standardized as national institutions, but whose success in these operations depends on the size and strength of their personal following.*¹⁴

While they vary in cultural forms, Wolf provides as examples of such brokerage systems the *compadrazgo* system in Latin America, the Chinese *kan-ch'ing*, and the Japanese *oyabun-kobun*; to which I would add *clientela* in Italy and Sicily, the *jajmani* system in India, and the patron-client system in the Philippines.¹⁵

¹² These processes are illuminated and applied with excellent effect by Charles Tilly in *The Vendée* (Cambridge: Harvard University Press, 1964), especially ch. 2.

¹³ "Gatekeepers," as described by Kenny, "largely dominate the paths linking the local infrastructure of the village to the superstructure of the outside urban world." See his article "Patterns of Patronage in Spain," in the *Anthropological Quarterly*, 33 (January 1960), pp. 14-23.

¹⁴ Eric Wolf, "Aspects of Group Relations in a Complex Society: Mexico," in *Contemporary Cultures and Societies of Latin America* (New York: Random House, 1965), edited by Dwight Heath and Richard Adams, p. 97. (Italics added)

¹⁵ Latin America, China, and Japan cited by Wolf, *ibid.* A full treatment of *clientela* in Italy

would hypothesize that such clientele systems might be encountered in any developing country in which kinship systems are unable to perform linkage functions between persons of low and high status, or between the community and the nation. Where kinship systems can perform these linkage functions at all, as in Greece (and under certain conditions in Italy), they are likely to be responsive to only a limited range of needs, leaving low-status clients to rely on non-kinship clientele systems as well.¹⁶

Of great importance is the manner in which these extended clientele systems change over time. Traditional, land-owning patrons may become brokers, but additional brokers may appear to compete with them for followings on the local level. Power holders on the national level may or may not consolidate and formalize some of these clientele systems, playing off one network of brokers against another in the process. These processes of change, and their significance for political development, will be more understandable if we consider some concrete historic examples.

Sydel Silverman, in "The Community-Nation Mediator in Traditional Central Italy," focusses precisely on such changes over time.¹⁷ According to her, prior to Italian national unification, the patron-client system was almost the exclusive domain of the great landlords, who acted in the main as direct benefactors, but also as links with the larger, Church-dominated society of central Italy. As far as commercial ties were concerned, they too were guarded by the landlords, but extended only to provincial market towns. Following unification in the 1860-1861 period, nation-community contacts grew, and landlords added to their functions as direct benefactors (loans, employment, land-access, dowry gifts, medicines) those of brokerage services. When a peasant client had dealings with bureaucracies—taxes, credits, etc.—or with the

police in the area, the patron acted as broker. The role of broker, in fact, became generalized in peasant dealings with "outsiders," and the "letters of recommendation" became more highly valued in many instances than direct patronage benefits. Such letters were considered imperative when undertaking an arrangement with a distant merchant, or in seeking public employment. As outside relationships became more important over time, says Silverman, "the most valuable patron was neither the wealthiest nor the most generous, but the one with the best connections."¹⁸

In addition to the changes of function of the traditional patrons (the large landowners), which transformed them into brokers, other local people with "outside connections" also began to assume brokerage functions—bourgeois landowners, schoolteachers, physicians and pharmacists, priests, tax collectors and other local officials. Some of these "new" brokers had connections with the marketing system, and some with the political system, but all were intermediate in socio-economic status. They were, in other words, those whom one writer has recently characterized as the "small intellectuals" of society, whose status and role functions place them in the "strategic middle" of the social structure.¹⁹ The Italian case clearly suggests the impact of state centralization in the little community, transforming traditional patrons into brokers, as well as creating a new pool of potential brokers (i.e., governmental agents) on the periphery of the peasant society. Similarly, the penetration of market networks, with its resultant differentiation and specialization of new roles, further enlarged the pool of potential brokers. These twin forces for change may be seen in another historic case, that of Mexico.

Eric Wolf specifically undertook a diachronic analysis of brokerage groups in rural Mexico in his seminal article, "Aspects of Group Relationships in a Complex Society: Mexico."²⁰ First, he traced the entry of the Spaniards into the previously autonomous Indian communities, and the establishment of landed power-holding by representatives of the Crown. This was accomplished through the *encomienda* system, and in agriculture as well as mining, enclaves of primary production were established and linked into a rudi-

mentary trade system with the mother country. In addition to the landholdings producing for international trade, landed powerholders, encroaching on the communal lands of the Indians, established autonomous, self-sufficient holdings in the manorial or patrimonial style.²¹ Both types of holding provided bases of manpower and wealth for a highly decentralized system of political power. In time, the struggle by Spain for the recapture of its political power and monopoly in the trading system precipitated the War of Independence by the New World landed elites. During this period of Mexican land history, the same kind of "traditional" patron behavior described for Italy by Silverman, characterized Mexican landlord-peasant relationships, exaggerated by cultural and linguistic differences.

According to Wolf, a byproduct of the trade systems established under the Crown had been a group of "marginals"—small storekeepers, middlemen, casual farmers and specialized workers located in the villages and entrepreneurial communities near mines, *haciendas*, or mills. With the destruction of the ties to Spain, the legal devices which had until that time granted a small measure of protection to the Indian communities were swept aside, and a long period of land-grabbing began. Communal property-holding dissolved into "land as a commodity," and the best remaining Indian lands were taken over by large landlords, or invaded by the upward-striving "marginals." From these processes grew the classic *hacienda* system, the epitome of autonomous, self-sufficient localism.

The Revolution of 1910 had, as one of its major consequences, the recapture of local political power by the central authorities. Violent peasant upheavals eliminated some of the local, landed powerholders, and agents of government were dispatched into the rural areas to foster the business of the "outside" authorities. As in Italy, many of the remaining landowners, more likely to be bourgeois than "aristocratic" in standing, became transformed from direct benefactors (patrons) into brokers. With the greater flow of goods and services into the rural areas which characterized post-revolutionary Mexican governments, not only did local representatives of the national government proliferate and increase in importance as brokers, but the local "small intellectuals" found increasing employment for their specific mediating skills, thereby gaining for themselves a useful channel of socio-economic mobility and influence.

²¹ See Eric Wolf, *Peasants* (Englewood Cliffs: Prentice-Hall, 1966), especially "Types of Domains," pp. 50-59.

III. THE CLIENTELIST STATE

Small-scale patrons, we have seen, may become transformed into brokers in the course of state and market centralization. This implies that the patron-client pattern is replicated on a higher level of organization; and indeed this is found to be the case. Thus, in discussing the Thai bureaucracy, Shor observed that:

... The personal clique, based on a feudal-like system of personal obligation, provides the principle focus of bureaucratic loyalty and identification. Bonds of reciprocal obligation, reminiscent of earlier patron-client structures in the traditional social system, informally align a number of dependent subordinates with individual political and administrative leaders in more or less cohesive informal structures.²²

And in commenting on Rustow's study of the Turkish bureaucracy, Guenther Roth points out that there exists "what is imprecisely known as 'corruption': 'connections' count, favoritism prevails, and for the few there is abundant profit in real-estate dealings."²³ There are probably few countries in which such forms of behavior cannot be encountered; the important difference lying in the fact that in some—for example, contemporary South Vietnam—these forms dominate the organization of the polity. What we have then is a variation on Weber's Patrimonial State. As Guenther Roth has said of this variation, "The second type of patrimonialism is personal rulership on the basis of loyalties that do not require any belief in the ruler's unique personal qualifications, but are inextricably linked to material incentives and rewards."²⁴ I propose that we call this model the Clientelist State.

The utility of the clientelist notion is not limited to personalist, primitive polities. As Roth quite rightly points out, "in terms of traditional

²² Edgar Shor, "The Thai Bureaucracy," *Administrative Science Quarterly*, 5 (June, 1960), pp. 70, 77, 80, as cited in Guenther Roth, "Personal Rulership, Patrimonialism, and Empire-Building in the New States," *World Politics* 20 (January, 1968), p. 202.

²³ Roth, *ibid.*, p. 203.

²⁴ *Ibid.*, p. 196. For vestiges of such behavior in complex societies, see Eric Wolf, "Kinship, Friendship, and Patron-Client Relations in Complex Societies," in *The Social Anthropology of Complex Societies* (New York: Praeger, 1966), edited by Michael Banton, pp. 1-22. An excellent study of clientelist politics in administration is Anthony Leeds, "Brazilian Careers and Social Structures: An Evolutionary Model and Case History," reprinted in Heath & Adams, *Contemporary Cultures*, *op. cit.*, pp. 379-404.

political theory, some of these new states may not be states at all but merely private governments of those powerful enough to rule" . . . but, on the other hand, ". . . personal rulership . . . is an ineradicable component of the public and private bureaucracies of highly industrialized countries."²⁵ I should now like to turn to the impact of clientelist politics in the national electoral process of many developing countries. The client-broker-patron network, we shall find, is of key importance as the electoral process reaches the level of the peasant village. I do not intend to digress for the moment to analyze the historic processes by which peasant voters—usually illiterate—become enfranchised, nor the processes by which elections come to play a central role in the distribution and transfer of political authority. Let us simply acknowledge the observable fact that in many countries today, including Italy, Venezuela, India, Turkey, the Philippines, and others, peasants do vote and elections are determinative. Patron-client patterns of behavior become significant for such countries in the periodic mobilization of peasant voters. At the level of the village, we find competition among brokers and potential brokers for peasant votes which can be delivered to a particular political patron or potential patron. Such competition, which has been described as "factionalism" in village politics, is an essential ingredient in the process of aggregating clienteles into a widespread network, and linking them to vertical patronage structures in the political system.²⁶

National or regional political leaders recruit local political leaders from among the competing

²⁵ Roth, *op. cit.*, p. 196.

²⁶ It would be a mistake, however, to assume that inter-broker competition automatically increases the power of the client in relation to the broker or patron. Individual brokers and/or patrons tend to control different resources, not to have differential control over the same resources. Furthermore, competition may occur in terms of the number of peasant votes, but not necessarily for the votes of the same peasants. Each broker tends to mobilize the votes of the peasants over whom he has some kind of critical leverage. Indeed, inter-broker competition may lead to less bargaining power for the client, rather than more, as for example the case of a peasant who finds himself within the power domain of a landlord, a moneylender, and a storekeeper, all of whom pressure him to vote in accord with their particular preferences. In short, the degree of power asymmetry between patron and client or broker and client is a matter for empirical enquiry; and if there is no asymmetry, the relationship in question is not clientelism.

patrons and brokers. Local brokers and patrons recruit subleaders, or political workers, in turn; and these workers recruit or assemble small followings from among their kin, caste brothers, occupational colleagues, or voluntary group associates. Mayer calls such a cross-cutting electoral aggregate an "action-set," assembled for a particular action fixed in time and space (i.e., an election). In all essential details, it appears to be an aggregation of clienteles:

These workers acted as links between the candidate and the electorate. Sometimes they did this for the advantages they calculated would accrue to them if the candidate were elected; sometimes they were acting because of party loyalty and friendships formed over the years without any thoughts of gain from the election itself; and at yet other times they were discharging specific obligations contracted at earlier times. *In the same way, there was an attempt to reach voters on the basis of a past or future benefit . . . In consequence, a great deal of the electioneering was carried out by workers, who sought to influence those with whom they had some appropriate relationship.*²⁷

The exact nature of the "appropriate" relationship is a significant question. A local political worker may pull together voters on the basis of kinship ties, fictive kinship or caste ties, or through a variety of relationships, including patron-client ties. The worker who pulls such electoral bloclets together assumes the role of broker for that group with a patron group or institution, in this case a political party. Furthermore, there is some evidence which suggests that the "appropriate relationship" for pulling in peasant voters may be distinctly different from one party to another. Table 1 below is a rearrangement of data presented by Ralph Nicholas from his study of factional politics in Govinda-

²⁷ Adrian Mayer, "The Significance of Quasi-Groups in the Study of Complex Societies," in *The Social Anthropology of Complex Societies*, *op. cit.*, p. 103. (emphasis added). Note that at this point we might break down brokers into at least three types, or specialists: one, a grass-roots mobilizer, or "ward-heeler"; two, a pure broker, of the kind found on the floor of a stock exchange; and three, a high level influence peddler. The mobilizer can turn out the bodies for any particular purpose, the influence peddler locates political patrons who desire mass political services, and the pure broker brings them together in the political market place. Note also the cross-class-cutting nature of this process. In a significant sense, it functions to integrate actors high and low in the social hierarchy, thereby serving as a potential buffer to inter-class conflict.

TABLE 1.—FACTIONAL ALIGNMENTS OF ALL POSSIBLE VOTERS IN GOVINDAPUR, WEST BENGAL

Factional Leader No.	Party Affilia- tion of leaders	Basis of membership support (per cent)					Total
		Kinship	Caste	Economic dependence	Neighbor hood Head- man	Mutual enemy	
1 & 2	Congress	13%	7	44	17	19	100%
3 & 4	Independent	28%	33	14	25	0	100%
5-9	Communist	52%	20	7	20	1	100%

pur, West Bengal, in which he analyzed the basis for membership in nine village factions, each with a leader linked to a particular political party.

The data in Table 1 lead me to the following tentative hypothesis. The exact nature of the ties to peasant voters which are activated in mobilizing an electoral turnout depends on two related factors: the particular needs of the client, and the relationship of the potential patron's political party to the government. In this Indian case, all parties tended to succeed in mobilizing followings based on neighborhood ties—the headman worked well for the Congress, the Independents, and the Communists. But the Independents and Communists were heavily dependent on utilizing kinship and caste ties to assemble their clienteles. This suggests that the brokerage functions which they performed for their clients were essentially defensive in nature—insuring that their relatives and caste brothers received equitable treatment at the hands of governmental representatives such as tax collectors, credit and extension agents, and the police. This is the other side of the coin of the functions most likely performed by the Congress party brokerage system which involved preferential treatment. This might include access to and influence in the making and administration of economic programs and policies which affected rural enterprises (and the people dependent on them); and in addition, knowledge of and influence in the judicial and police systems for the purpose of dealing with mutual enemies.

IV. CLIENTELIST POLITICS AND POLITICAL PARTIES

We need now to examine more broadly the impact of clientele politics on political parties; and further, to project our analysis into the realm of national politics. This can be economi-

cally accomplished by comparing two striking cases which have been rather fully documented and analyzed: Italy and Venezuela.²⁸ While many of the elements of clientelist politics—with a peasant mass base—can be encountered in the recent or current political history of India, Mexico, Bolivia, Chile, Brazil, Peru, and the Philippines, and to a lesser degree in Indonesia, France, Guatemala, Spain, and Turkey, the cases of Venezuela and Italy are not only well-documented, but seem to represent the upper limits, or fullest development, of which such transaction systems are capable.

Both countries are multiparty electoral democracies in which more than one political party has competed for a peasant base of support through the elaboration of clientele systems. The degree to which the various parties depend on the peasant vote varies, of course, but it is very substantial for the Communist Party (PCI) in Italy, and for the Democratic Action (AD) and Social Christian (COPEI) parties in Venezuela. The Italian Christian Democratic Party (PDC) also receives significant support from peasant constituencies in the south. In both cases, peasant clienteles have been organized into a peasant union movement, which interpenetrates the party system at the local, regional, and national levels. In each country, there has been an extensive agrarian reform program which has provided land and a flow of governmental goods and services downward through the same clientele system which channels votes upward from the peasant base. What we have, in essence, is a transaction system with

²⁸ See Sidney Tarrow, *op. cit.*; and John Duncan Powell, *Peasant Mobilization and Agrarian Reform in Venezuela* (Cambridge: Harvard University Press, forthcoming).

reciprocal, but unequal, flows of goods and services—votes for agrarian reform benefits. Figure 1 illustrates the Venezuelan system (which I have called the “rural problem-solving system”) from the point of view of the peasant. Working through such a network is one of the few instrumental ways in which the peasant can counter his environmental threats.²⁹ The Italian clientele system, while somewhat more complex, functions in exactly the same manner. An important factor, obviously, is whether or not a particular party is included in a coalition government—and which portfolios or ministries it can influence. In general, the brokerage function is performed by all parties, but those parties outside the government tend to focus on the defense of peasant clients, and the government parties focus on influencing the flow of patronage for their clients. This is a strong tendency, not an absolute distinction.

I wish to emphasize at this point the explicit argument that *peasant clientele systems are built upon, incorporate, and recapitulate the inter-personal patterns of behavior known as clientelism*. Unlike simple patron-client relations, or primitive clientele systems, the Italian and Venezuelan networks have been purposively organized from above, endure in institutionalized form, exchange a wide range of goods and services, and provide quite lengthy chains of linkages—from the peasant to the President or Prime Minister. They are, in a quite specific sense, politically representative. How did such networks come into being, and what effect have they had on national politics in these countries?

In both cases, an urban-based political elite group undertook the organization of the peasantry as a way to mobilize the political capital needed to break into a traditional, elite-dominated inner circle of power in national politics. In Italy, it was the Communist Party which succeeded in organizing the peasantry in the postwar period. In Venezuela, it was the Democratic Action Party (struggling simultaneously to establish a meaningful electoral process and to break the hold of the entrenched, traditional elites on governmental power) which began to organize the peasantry during the 1930's. The responsiveness of the peasantry in both cases rested in part on two factors: a history of bourgeois encroachments on lands formerly available for peasant use; and a recent period of prolonged, serious dislocation of commercial agri-

culture. In Italy the theme of land *irredenta*, according to Tarrow, originated in the massive take-over of Church and State lands by the bourgeoisie following the national unification in 1861. In Venezuela, there were twin strands of peasant land irredentism: broken promises of land for military service in the armies which fought the War of Independence and the Federal Wars of the nineteenth century; and the encroachment of the bourgeoisie on public lands during the extended, personalistic regime of the dictator, Gómez (1908-1935). The encroachments of the bourgeoisie signalled a “commoditization” of the land, and a subsequent reduction in free land use by the peasantry, often drawing them into a tenancy relationship with the new owners.³⁰ Dislocations in both commercial and peasant agriculture occurred during the depression in both countries, and were further exacerbated in Italy by World War II. In short, the peasants' status in the prevailing land tenure situation was precarious to begin with, and grew worse prior to their mobilization.

Both AD and the PCI, then, turned to the organization of a discontented peasantry as a way of mobilizing political capital. In the initial stages, before either was in a position to control a government patronage network, their efforts focussed on direct action at the community level, often involving the invasion of farm properties. This was especially true in the case of Italy, where the land invasions of the early 1950's were closely related to the efforts of the PCI to shape and capitalize on peasant discontent. In Venezuela, AD's opportunity to open up lands to peasant access followed its participation in the *coup d'etat* of October 1945. Dominating the subsequent Revolutionary Government, AD initiated a *de facto* agrarian reform, granting (by decree) access to governmental and private farms to peasant unions organized by the party. The ability to reward followers with land—whether by invasion, as in Italy, or by governmental action, as in Venezuela—quickly expanded the networks of peasant unions, which were actual or aspiring clienteles of the parties.

²⁹ For the proposition that the degree of tenancy correlates positively—and highly—with radical or revolutionary action on the part of the peasantry, see Arthur Stinchcombe, “Agricultural Enterprise and Rural Class Relations,” reprinted in *Political Development and Social Change* (New York: Wiley, 1966), edited by Finkle and Gable, pp. 485-497. The same point is made by Bruce Russett in “Inequality and Instability: The Relation of Land Tenure to Politics,” in *World Politics*, 16 (April, 1964), p. 452, when tenancy is combined with a high degree of inequality in landholdings.

³⁰ See John Duncan Powell, “Venezuela: The Peasant Union Movement,” in *Latin American Peasant Movements* (Ithaca: Cornell University Press, 1969), edited by Henry Landsberger, pp. 62-100.

fell in 1958, and AD was successful in gaining the presidency and dominating a decade of subsequent coalition governments, then the system illustrated in Figure 1 reached fruition, with a well-financed *de jure* agrarian reform program providing a flow of goods and services into the rural areas. In response to AD's successful building of a peasant base of electoral support, the Social Christian (COPEI) party began its own program of organizing peasant unions. For six years, COPEI was included in the coalition government, providing it some direct access to agrarian reform patronage. After leaving the coalition government, the COPEI peasant unions still maintained indirect access to governmental decision-making (though less effectively than before) through their participation in the multipartisan Federation of Venezuelan Peasants.³¹

In Italy, however, the Christian Democrats, and not the Communists, were in control of the government when the *de jure* agrarian reform program was established. As a result, many of the local leaders and peasant clients organized by the PCI for the purpose of obtaining land (by invasions) were drawn into the Christian Democratic peasant-union-party structure when land and other benefits could be had through the agrarian reform program. As Tarrow describes the resulting dilemma of the Communists:

... the Catholic Confederation of Direct Cultivators is really a corporate arm of the government which dispenses patronage to peasants through a complicated system of interlocking directorates with the provincial agricultural syndicates ... The chain of causation is revealing. In leading the struggle for the land, the Communists forced the Agrarian Reform; but in the achievements of the Reform, many peasants became dependents of the Christian Democrats and of the state.³²

With the successful establishment of a state-supported clientele system which provided land, credit, extension services, infrastructure and marketing services to peasant clients, the peasantry became "demobilized" in Tarrow's phrase. That is, land invasions and threats of violence subsided. In an important sense, however, the electoral mobilization of the peasantry was not a phenomenon which faded away, but one which was in fact stabilized and institutionalized

through the same clientele system which provided the agrarian reform benefits. In short, the notion that peasants will lapse into political inactivity once they obtain a piece of land seems to be a myth. A piece of land is only a necessary, but not sufficient, condition to allow the peasant to escape the world of *la miseria*. He also needs financial, technological, and marketing assistance to significantly improve his standard of living. There is a continuing need for a patron, or patronage system, which can respond to increasingly sophisticated and complex demands, and thus peasant dependency and peasant mobilization become institutionally linked.

Both the Christian Democrats in Italy and Democratic Action in Venezuela have achieved the necessary transactional equilibrium within their peasant clientele systems to stabilize a dependable base of legitimizing electoral support. From the point of view of the party leaders at the national level, a clientele system based on peasants rather than on other societal groups seems to be a sound investment. The peasant is an economical client. His range of needs tends to be narrower and more fixed than that of comparable urban clients. And in meeting the needs of peasants for more land to farm, technological and financial assistance in farm operations, public health and sanitation projects, and finally, marketing assistance, governmental decision-makers are acting in a manner not only compatible with, but prescribed by the logic of economic development. This is not the case in responding to the needs of potential urban client groups, where the costs of improving the quality of the urban environment are high, the gestation periods long, and the returns on capital investment indirect. But the support of such an electorally-legitimizing clientele system has its disadvantages as well as its advantages in the national political arena.

In analyzing the assets and liabilities of a peasant clientele system for a political party in governmental power, I would like to leave aside the Italian case, in which peasant support is relatively marginal to the position of the Christian Democrats, and consider, in addition to Venezuela, the cases of Bolivia and Mexico.³³ In the latter two cases, peasant clientele support is, or has been, of much more critical import than in

³¹ In the December 1968 elections COPEI won the presidency and hence control over the formation of a subsequent coalition government from which AD was excluded. As of this date, therefore, access of the two parties is the reverse of the 1964-1968 situation.

³² Tarrow, *Peasant Communism*, *op. cit.*, p. 364.

³³ See Peter P. Lord, "The Peasantry as an Emerging Political Factor in Mexico, Bolivia, and Venezuela," (Madison: University of Wisconsin Land Tenure Center, 1965), Research Paper No. 35 (mimeo.); and Charles Erasmus, "Upper Limits of Peasantry and Agrarian Reform: Bolivia, Venezuela, and Mexico Compared," in *Ethnology*, 6 (October, 1967), 349-380.

the Italian case. In Bolivia and Mexico, as in the other two countries, the peasantry had lost land to an encroaching bourgeoisie. And both countries had experienced a prolonged period of economic dislocation, which was both a contributing cause and a partial effect of the Mexican Revolution of 1910 and the Bolivian Revolution of 1952. In neither of these two cases had a political party seeking to break into the ranks of the traditional elites originally organized a political base among the peasantry as a part of that effort. In Mexico and in Bolivia, governmental parties which grew out of the revolution incorporated embryonic peasant organizations and transformed them into a supportive clientele network as part of their consolidation of political power. As in Venezuela and Italy, an agrarian reform program was the patronage vehicle, partly consolidating and ratifying *de facto* changes brought about by peasant land invasions, and partly distributing land and other goods and services throughout the areas of peasant concentration. While the Bolivian, Mexican, and Venezuelan cases differ in detail and circumstances, one can state that governmental parties, supported by peasant clientele systems, successfully governed for extended periods of time—in Bolivia from 1952 through 1964; in Mexico, from the mid-1930's to the present; and in Venezuela from 1958 to at least 1968. There is reason to believe that the government which replaced the original sponsor of the Bolivian Revolution (the MNR) in 1964 has continued to rely on the peasant clientele system established by its predecessor.

One of the salient characteristics of governments based on peasant clientele systems has been their capacity to withstand challenges from groups on both extremes of the political spectrum. In Mexico and Bolivia, where the traditional military establishments were eliminated, worker and peasant militias were used to resist the overthrow of the revolutionary governments by right-wing violence. Obregón, with the help of agrarian unions, successfully defended his government in 1923 against the attack by General de la Huerta. In Bolivia miner and peasant militias were instrumental in resisting the overthrow of the Revolutionary government until 1964. In Venezuela, where the professional armed forces were co-opted into the governmental clientele system rather than destroyed, armed peasant and labor militias were never formed, but mass peasant demonstrations were organized in Caracas on several occasions when the threat of a right-wing or dissident military *coup* seemed imminent, as in 1960. We might characterize such a capacity of resistance as stability against the recapture of political power by

the traditional elites who were earlier displaced by the parties in government.

A peasant clientele base has been effective in meeting destabilizing challenges from the left also. In Bolivia and Mexico, one-party state during the period under consideration, this amounted to resistance by the peasant branch, to a left-wing challenge from the labor branch of the party. In Mexico, in 1940, insurrection within the party by the leader of the left-wing labor sector, Lombardo Toledano, was resisted partly through the intervention of the peasant union. In Bolivia, Juan Lechín, the leader of the miners' unions, made a similar attempt in 1964 to capture his party's presidential nomination, and was resisted by the peasant branch of the party. In Venezuela, the violent opposition of the Communists and left-wing splinter groups, and guerrilla efforts have been unsuccessful partly because of the disinclination of the peasants—who are clients of the government—to join in an attack on the source of their patronage. The characterization of all of these efforts as "left-wing" probably needs some qualification. In all three of these cases, the longer a peasant-based party has remained in governmental power, the more centrist, pragmatic, and moderate its policies have become. In other words, the drift away from earlier doctrinal positions has been toward the "right." Attacks from the "left," therefore, may also be accurately described in many cases as attacks from party loyalists who are unwilling to make compromises for the sake of maintaining governmental legitimacy among other groups in the political system.

Whatever the ideological implications of these events—and perhaps ideological references are more confusing than helpful in this context—rural-based parties have been able to withstand the destabilizing challenges of a number of urban-based, competing elites. As Samuel P. Huntington sees this phenomenon (which he describes as the result of a "ruralizing election"):

... the party which was strong in the countryside normally secured control of the national government and inaugurated a regime characterized by a high degree of political stability. Where no party had a clear base of support in the countryside, some form of instability was the result. In some instances, urban revolts may overturn rural-based governments, but in general governments which are strong in the countryside are able to withstand, if not to reduce or eliminate, the continuing opposition they confront in the cities.³⁴

³⁴Samuel P. Huntington, *Political Order in Changing Societies* (New Haven: Yale University Press, 1968), p. 437.

The use of peasant clients for purposes of political combat outside of the electoral realm has its limitations, obviously. But a clientelist base of support is also quite advantageous in political struggle and accommodation short of combat. Since the nature of the "contract" struck between the government (patron) and the peasantry (client) is concerned, really, with the flow of a rather mundane range of pay-offs—small amounts of land, credit, technological and marketing assistance—there is little or no ideological or programmatic content in the "contract" which might entangle a political elite with dissidents within or without its own party. As a result, peasant-based parties enjoy an amazing degree of flexibility in questions of policy, doctrine, and dogma. They are able to accommodate many divergent points of view within their own parties, and to deal pragmatically with opposition points of view without stirring up internal resistances. They are "pragmatic parties" *par excellence*.

But these very advantages of clientelist bases of support suggest the limitations of such systems. First, a clientelist base of support tends to erode the ideological coherence and program content with which the leaders of these parties come to power. This is less true in a revolutionary situation, as in Bolivia and Mexico, where the parties which came to power had no ideological coherence to begin with. But Democratic Action, and to an even greater extent, the Italian Christian Democrats, did attach some importance to doctrine and ideology. The Italian case is especially striking, for both the Communists and the Christian Democrats were frustrated by the manner in which their policy and doctrinal preferences were thwarted by the clientelist mentality. The power of the peasant culture in this respect was clearly noted by Tarrow:

... social groups remain chaotic, and political organization normally resides latently in the clientele ties between landholder and agricultural worker, lawyer and client, and bureaucrat and favor seeker. Local and parochial loyalties suffuse politics. Politics has very little ideological content, and popular imagery recognizes only two basic social groups: peasants and non-peasants.³⁵

The result has been internally traumatic for the Italian Communist Party, which operates in a distinctly different milieu in the north. "Party leaders," notes Tarrow, "complain that southern members cluster around dominant personalities and neglect the day-to-day tasks of organization and proselytism," and "critics maintain that the

evidence points to the PCI's being a typical southern party of clientele."³⁶

Ideological erosion in the southern clientelist milieu has equally dismayed the leaders of the Christian Democratic Party, despite the fact that electoral support is derived therefrom:

Fanfani called for the *political*, and not simply the economic, development of the South. "Above all," he said, "we must create active and efficient party sections and organizations in southern Italy, if we want to create a politics of facts and ideas instead of a politics of agitation and macaroni" . . . terms that epitomized the traditional tools of southern Italian politics: the generic protest, the patronage appointment, the letter of recommendation, the sack of pasta on election day—in other words, the clientele system.³⁷

In short, one of the limitations of clientelist politics is the strain it places on coherent ideologies. This may manifest itself in several important ways. Ideological parties may find it so difficult to reconcile discrepancies in ideas and reality that they will be either unable to build a clientelist base to begin with, or to maintain one if they do. Therefore, other, more pragmatic, parties may outdo them in competition for the peasant vote. Similarly, within parties, the stretching of ideology to encompass and legitimate clientelism may work in one of two ways: either the majority of the party leadership accepts the erosion of ideology, in which case the ideological purists among the leadership may leave the party; or the leadership majority may resist the erosion of ideology, in which case the peasant clients may leave or be lured away from the party. In either case, the party is weakened.

A second general limitation of clientelist politics is that it seems to be a transitional phenomenon—or, better put, appropriate and successful only under certain conditions, and then for a limited period of time. As Huntington has analyzed this situation in his book, *Political Order in Changing Societies*, political modernization involves several alternative cycles of change in urban-rural power and stability.³⁸ The mobilization of a peasant base of support by an urban-based political party is one form of what Huntington calls the "Green Uprising." Eventually, in the course of overall modernization, the growth of the city becomes a destabilizing phenomenon; in some cases, an urban elite group can form an alliance with the peasantry, sur-

³⁵ *Ibid.*, p. 270.

³⁸ Huntington, *op. cit.*, especially the first and last chapters.

³⁶ Tarrow, *Peasant Communism*, *op. cit.*, p. 261.

rounding, as it were, the unstable city with the stable countryside by bringing the two into an interdependent relationship. The resulting period of governmental stability may then be used to perform many of the necessary modernizing tasks of government in the course of development. Success, however, brings with it a decreasing relevance and effectiveness of the original peasant base of support:

If revolution is avoided, in due course the urban middle class changes significantly; it becomes more conservative as it becomes larger. The urban working class also begins to participate in politics, but it is usually either too weak to challenge the middle class or too conservative to want to do so. Thus, as urbanization proceeds, the city comes to play a more effective role in the politics of the country, and the city itself becomes more conservative. The political system and the government come to depend more upon the support of the city than upon that of the countryside. Indeed, it now becomes the turn of the countryside to react against the prospect of domination by the city.³⁹

In terms of a peasant-based clientele system, such as Venezuela's, the end of this cycle is marked by a gradual tapering off of governmental support for the agrarian reform program, as growing urban-based clientele groups exert increasing influence on internal party politics. The budgetary priorities problem may provoke splintering within the party, as brokers in the peasant clientele system find their ability to deliver the goods downward gradually eroded. These party subleaders in many cases demand a "re-radicalization" of the agrarian reform—that is, a resumption of larger flows of land and other agrarian reform benefits—and may even try to reinstate the land invasion tactic. In Venezuela and in Mexico, such internal dissension has resulted in brokerage leaders identified with the peasant branch either leaving the party for a more radical alternative, or being purged; and the occasional establishment of new peasant union splinter movements.

The general pattern, then, seems to be a cyclical one—the rise and fall of peasant-based clientelist politics. Where the political culture is a carrier of patron-client patterns of behavior, the disintegration of peasant clientelist politics does not mark the demise of the generic pattern. To the contrary, urban-based clientelist politics may proliferate. They may be more subtle and complex, but function in essentially the same manner. The agrarian reform, often begun with

an initial burst of distributive activities, is slowed down, or consolidated, into a bureaucratic program of gradually receding importance. It may be succeeded by vast programs in worker's housing construction, or public works projects to improve the nature of life for the urban masses. These and other signs may indicate that the cycle described by Huntington is nearing its end.

V. CONCLUSION

It seems appropriate to conclude this discussion of clientelist politics by placing the concept in perspective: what claims are made for it as an heuristic tool, and what are its limitations? The concept, I believe, helps to illuminate the political behavior of low-status actors, particularly peasants, as they are incorporated, recruited, mobilized, or inducted into the national political process. Inasmuch as the induction of the peasantry into this process has in fact not yet occurred in many of the developing countries, an understanding of clientelist politics may be useful in a predictive sense. And while clientelist behavior may be most visible in the political cultures of Mediterranean extraction, there is much—although scattered—evidence that it can be encountered in political cultures in many parts of the world. This is not a prediction that clientele systems of the type found in Italy or Venezuela are to be anticipated elsewhere, but that clientelist patterns of interpersonal behavior may be a significant factor in the process of peasant politicization everywhere.

Clientele systems clearly differ from other forms of politically representative systems in several ways. In clientelism, there is an almost complete dependency on face-to-face relationships in the building and maintenance of the system. Impersonal communications between persons low and high in the system hierarchy are as ineffective as they are rare.⁴⁰ A low-status participant may, on occasion, personally approach a high-status participant in the same clientele system, but normally he depends on a series of linkages with intermediate brokers. This norm-dependency on personal contact—derives from the nature of the patron-client contract.

The dyadic contract between 'patron and client—or broker and patron—is a private, un-

⁴⁰ In my study of local peasant union leaders in Venezuela, it was found that 79.9% of all contacts between local and state leaders were in the nature of personal visits. Even contacts with national level peasant union leaders were predominantly in the nature of personal visits (33.1%), rather than through correspondence (11.9%) or other means.

³⁹ *Ibid.*, p. 77.

written, informal agreement, and highly personalistic in content. There is no public scrutiny of the terms of such agreements. There is no public entity which functions as an enforcement authority concerning such agreements. There is, in short, no process by which either partner of the agreement can go "outside" the dyadic relationship for enforcement of the contract, or to bring sanctions for noncompliance. Enforcement, compliance, and performance are bound up in, and limited to, the face-to-face relationship between the client and broker, or the broker and patron.

This stands in sharp contrast to the relationship between citizen and representative, or even party member and party leader, in modern systems of political transactions. In essence, the patron-client pattern occurs in the realm of private accountability, the modern pattern in the realm of public accountability. In fact, such a distinction is what makes patron-client ties functional in the first place. As Eric Wolf has put it, in a slightly different context:

The clearest gain from such a relation should therefore appear in situations where public law cannot guarantee adequate protection against breaches of non-kin contracts. This can occur where public law is weak, or where no cultural patterns of cooperation between non-kin exist to guide the required relationship. It can also occur in dealings which border on the illegal or the extra-processual.⁴²

The most obvious difference that the private-public distinction makes is in the degree of power asymmetry between superior and subordinate. Superiors in a clientele system are relatively free to behave in an arbitrary and highly personalistic manner in dealing with their subordinates. Subordinates in a clientele system have relatively little recourse in such a situation. Theoretically, clients could improve their bargaining position relative to patrons through the formation of horizontal organizations, such as peasant unions. In practice, this seems difficult for at least two reasons. First, the power asymmetry between client and broker, or patron, on the local level works against the formation of such independent organizations. Organizers, potential local leaders, and prospective members are all relatively vulnerable to the negative sanctions available to the local broker or patron, who often enjoys the cooperation of other local authorities. Second, clientelist patterns of behavior frequently exist in the relationship be-

tween peasant union leader and follower.⁴³ For both of these reasons, peasant unions tend to be part of a clientele system organized from above, rather than a bargaining organization initiated from below.

The burden of this essay has been to explain the transformation of patron-client ties from a strictly local, landlord-peasant relationship of a traditional kind, into a complex, relatively modernized national transaction system. The main point has been that clientelist patterns of behavior persist in modern organizational form, and that an explanation of interpersonal or institutional behavior will be significantly enhanced by understanding the nature of clientelist politics. The fact that achievement criteria become more important in filling patron and brokerage roles is not inconsistent with the maintenance of traditional values embodied in the ascriptive-oriented traditional forms of clientelism. In fact, just as a relatively high power asymmetry promotes stability within clientele systems, the combination of traditional and modern value orientations in the "new" clientelism may function to perpetuate old forms in a manner quite consistent with modern organizational requirements. Seymour Martin Lipset, in discussing ways in which the Japanese have maintained particularistic and ascriptive traits while at the same time combining universalistic and achievement patterns into the elite recruitment process, illustrates how such a combination can function in a highly successful manner.⁴⁴ The example of Japanese industry, in fact, not only suggests that traditional patterns of behavior can be consistent with the requirements of modern organizational life, but may even enhance the performance of such requirements in a highly competitive environment. The implication which might flow from this would be that peasant-based transaction systems successfully perform in a competitive, modernizing political environment because of, not in spite of, the functionality of traditional practices and values.

The argument can be carried one step further.

⁴² For a concise picture of such relationships in the Brazilian Peasant Leagues, see Benno Galjart, "Class and 'Following' in Rural Brazil," *América Latina*, 7 (July-September, 1964), 3-23.

⁴³ Seymour Martin Lipset and Aldo Solari (eds.), *Elites in Latin America* (New York: Oxford University Press, 1967), pp. 42-44. See also Anthony Leeds, "Brazilian Careers . . ." *op. cit.*, and Charles Wagley, "Luso-Brazilian Kinship Patterns: The Persistence of a Cultural Tradition," in *Politics of Change in Latin America* (New York: Praeger, 1964), edited by Maier and Weatherhead, pp. 174-189.

⁴⁴ Wolf, "Kinship, Friendship, and Patron-Client Relations in Complex Societies," in *The Social Anthropology of Complex Societies*, *op. cit.*, p. 10.

I would submit the proposition that certain traditional elements of the political culture, such as clientelism, become more, not less, important as modernizing changes take place in a peasant-based society. Evidence relevant to this proposition has been turned up repeatedly by social anthropologists studying the adaptation of peasant cultures to the stresses and tensions associated with socio-economic change. As Mintz and Wolf suggest in their analysis of *compadrazgo* (a fictive kinship tie) in Hispanic America:

It is extremely noteworthy that the mechanism of *compadrazgo* has maintained itself here in the face of what appears to be progressively accelerating social change. We wonder whether the elaborations of the mechanism's forms may be part of the community's unconscious effort to answer new problems. It must increasingly face the insecurity of growing incorporation into the national structure and increasing local wage-based, cash crop competition. This may call forth an increased emphasis on techniques for maintaining and strengthening face-to-face relationships.⁴⁶

Further evidence that change increases reliance on certain traditional practices was found by Wolf in Mexico. In his study of the changing intergroup relations of Mexican Indian communities, he took note of the "tendency of new group relationships to contribute to the preservation of traditional cultural forms."⁴⁵ Myron Weiner's findings in India were also consistent with the proposition advanced above. In *The*

"Sidney Mintz and Eric Wolf, 'An Analysis of Ritual Co-Parenthood (*Compadrazgo*),' in *Peasant Society*, *op. cit.*, p. 194.

⁴⁵ Eric Wolf, "Aspects of Group Relations in a Complex Society: Mexico," in *Contemporary Cultures and Societies of Latin America*, *op. cit.*, p. 96.

Politics of Scarcity, he noted the strong tendency of post-independence political change to bring about marked increases in the activities of traditional community associations of various kinds. These associations were relied on to link village interests with the emerging structures of a modern nation-state.⁴⁶

In short, modernizing transformations in peasant societies may well make the study and analysis of clientelist politics more relevant than ever before.⁴⁷ While scholars generally acknowledge the importance of patrimonial-type behavior in traditional politics, both at the mass and at the elite levels, there may be insufficient appreciation of the fact that such behavior may survive, quite functionally, very late into the developmental process. Much of the evidence presented here has concerned the nature of such behavior in local politics, but I have also tried to demonstrate the importance of clientelist politics as an organizing principle at all levels of developing polities. Whether or not, and to what degree clientelism exists; whether it functions at the level of the village or throughout the polity; and what impact such behavior has on the course and pace of political development are significant, if not critical, empirical questions in the study of politics in peasant-based societies.

⁴⁶ Myron Weiner, *The Politics of Scarcity* (Chicago: The University of Chicago Press, 1962), especially pp. 36-72.

⁴⁷ In fact, such a literature seems about to emerge. For example, Professors René Lemarchand and Keith Legg of the University of Florida presented an excellent comparative study, "Clientelism and Politics: A Preliminary Analysis," to the members of the joint Harvard-MIT faculty Seminar on Political Development in February, 1970. The paper is planned for early publication.

AN EXPOSITORY DEVELOPMENT OF A MATHEMATICAL MODEL OF THE ELECTORAL PROCESS*

OTTO A. DAVIS, MELVIN J. HINICH AND PETER C. ORDESHOOK**

Carnegie-Mellon University

I. INTRODUCTION

The fundamental process of politics is the aggregation of citizens' preferences into a collective—a social—choice. We develop, interpret, and explain non-technically in this expository essay the definitions, assumptions, and theorems of a mathematical model of one aggregative mechanism—the electoral process.¹ This mechanism is conceptualized here as a multidimensional model of spatial competition

in which competition consists of candidates affecting turnout and the electorate's perception of each candidate's positions, and in which the social choice is a policy package which the victorious candidate advocates.

This approach, inaugurated by Downs's *An Economic Theory of Democracy*, and falling under the general rubric "spatial models of party competition," has been scrutinized, criticized, and reformulated.² To clarify the accomplishments of this formulation we identify and discuss in section 2 the general democratic problem of ascertaining a social preference. We review critically in section 3 the definitions and assumptions of our model. We consider in sections 4 and 5 the logic of a competitive electoral equilibrium. We assume in section 4 that the electorate's preferences can be summarized and represented by a single function; the analysis in section 5 pertains to competition between two organizational structures or two opposed ideologies (i.e., when two functions are required to summarize and represent the electorate's preference). Finally, we suggest in section 6 a conceptualization of electoral processes which facilitates extending and empirically testing our model.

II. THE DEMOCRATIC PROBLEM OF SOCIAL CHOICE

The early literature of spatial theory examines a relatively simple problem, a fundamental assumption of which is that a single dimension describes sufficiently the preferences of citizens. Assuming: (1) that candidates seek to win elections, (2) that all participants in elections (i.e., candidates and citizens) have perfect information, and (3) that the candidate can adopt any position on this single dimension; this literature seeks to ascertain the positions candidates should adopt. Finding such a position, however, requires, first, that it exists—i.e., that some position be dominant, by which

² Anthony Downs, *An Economic Theory of Democracy* (New York: Harper and Row, 1957). For additional theoretical developments see: Gerald Garvey: "The Theory of Party Equilibrium," this REVIEW, LX (1966), 29–38; David E. Chapman, "Models of the Working of a Two-Party Electoral System," *Papers on Non-Market Decision Making III* (Fall, 1967), and *Public Choice* (Fall, 1968)

we mean that if a candidate adopts that position then he is guaranteed at least a tie in the election and a positive plurality if his opposition selects some position other than the dominant one. Unfortunately, the existence of such positions cannot be guaranteed generally and additional assumptions are required for it to exist. Consider the following *incomplete* argument purporting to support the proposition that, if all citizens vote, the median preference of the electorate is the dominant position:

Let θ^* (see Fig. 1) represent the median position for the density of "preferences" $f(x)$; thus θ^* divides the density equally. If the first candidate selects the position $\theta_1 = \theta^*$, the second candidate selects the position $\theta_2 < \theta^*$, and everyone votes, the first candidate receives a positive plurality; he is preferred by all citizens to the right of θ^* , which by construction is one half of $f(x)$, and he is preferred by those citizens to the left of θ^* who are nearer to θ^* than to θ_2 (and who provide his margin of victory).

Since dominant positions exert a powerful attraction to candidates, the argument that candidates should converge to the median might appear to be trivial. However, such an argument is incomplete; it requires additional assumptions, one of the most important being that the form of each citizen's preferences is "single peaked". Specifically, the argument that all citizens to the right of θ^* prefer θ_1 with $\theta_2 < \theta_1 = \theta^*$, implicitly assumes the existence of a specific class of orderings of the alternatives on the horizontal axis. If preference is indicated on the vertical axis, the preference orderings in this class are represented by functions which change direction at most once from increasing to decreasing (i.e., are single peaked). If this assumption is not satisfied we may be unable to identify a dominant position so that a paradox of voting is said to exist.

The illustration of this assertion, which is a special case of Arrow's General Impossibility Theorem, is so simple that it bears repeating.³

³ Kenneth J. Arrow, *Social Choice and Individual Values* (New York: Cowles Commission Monograph #12, Wiley, 1951). See also: Duncan Black, *The Theory of Committees and Elections*, (Cambridge: Cambridge University Press, 1968); and with R. A. Newing, *Committee Decisions with Complementary Valuation* (London: W. Hodge, 1951). A general exposition of the paradox and its implications is given by William H. Riker, "Voting and the Summation of Preferences: An Interpretive Bibliographical Review of Selected Developments During the Last Decade," this REVIEW, LV (December, 1961), 900-911.

Consider three citizens whose preferences do not satisfy the single peakedness assumption:

Citizen	Citizen's Preference Ordering
1	$A \rightarrow C \rightarrow B$
2	$C \rightarrow B \rightarrow A$
3	$B \rightarrow A \rightarrow C$

Although each citizen has no difficulty defining a preference ordering among the alternatives— A , B , and C —no alternative is dominant. B defeats A , C defeats B , and A defeats C , so that the social preference ordering— $A \rightarrow C \rightarrow B \rightarrow A$ —is intransitive. Thus, if A , B , and C are the alternative positions for a candidate, he cannot find a strategy which guarantees him at least a tie.

The possibility that such a paradox exists poses a problem for majority decision-making. Although most standard procedures for aggregating individual preferences (e.g., voting) yield a unique social choice, if preferences are not single peaked such choices depend, for example, on the order in which the alternatives are presented.⁴ Thus, if we cannot guarantee the existence of dominant positions in the context of electoral campaigns, the outcome of an election may depend on the temporal order in which candidates select their strategies.

Downs, who was perhaps the first to introduce into the contemporary political literature the problems which the paradox poses, considers only the world of one dimension. A simple example demonstrates, however, that the problems which the paradox introduces are compounded as more dimensions are considered.⁵ Consider Figure 2 in which the vertical and horizontal axes index two relevant dimensions. Assume that the electorate consists of three

FIG. 1

⁴ Duncan Black, *op. cit.*, pp. 21-25.

⁵ Duncan Black and R. A. Newing, *loc. cit.*

FIG. 2

voters, with their preferred positions denoted by v_1 , v_2 , and v_3 , and that there are two candidates (who do not vote). Finally, assume that the concentric circles drawn about v_1 , v_2 , and v_3 represent the indifference contours of each voter's preference function. Thus, a voter is indifferent between two alternatives if they lie on the same contour, and he prefers one alternative to another if it lies on a contour closer to his preferred position—i.e., a contour of a smaller radius. Now let the first candidate adopt any strategy, say θ_1 . Observe that the position θ_2 defeats θ_1 in a majority vote since it lies on indifference contours of smaller radius than θ_1 for the two voters preferring v_1 and v_2 . But voters 2 and 3 prefer θ_1^* to θ_2 for similar reasons while θ_1 defeats θ_1^* , etc. Obviously this cycle continues indefinitely. No dominant position exists, and the position a candidate should adopt depends on the position selected by his opponent.

Although this result may not be inordinately surprising, it demonstrates an important distinction between the unidimensional and multidimensional cases. Consider Figure 2 again but assume that citizens cannot vote on x_1 (i.e., the value of x_1 is fixed). This is equivalent to assuming that only motions on a line parallel to the x_2 axis may be considered. Preferences on this line, by construction, are single peaked so that the value of x_2 preferred by v_2 is the dominant choice. Alternatively, if x_2 is fixed, the value of x_1 preferred by v_3 is the social choice. Thus, even though a dominant position exists for each of the dimensions taken individually, the composite of these dimensions yields an intransitive social preference.

We can easily imagine such a situation whenever citizens are permitted to vote both on the amount of some service to be provided pub-

lically and on the fiscal institutions for funding such a service. If the electorate is provided with the opportunity to vote only for the amount of the service to be provided (with a given fiscal institution) or only for the fiscal institution (with predetermined level of public activity) an unambiguous social choice may be revealed.⁶ Such choices, as the previous illustration demonstrates, are not guaranteed with the composite of these two issues.

Since such a simple example demonstrates that dominant positions, in general, do not exist for a multi-dimensional world, one wonders whether they might exist for some reasonable set of conditions. Tullock, for example, suggests that the paradox occurs with less frequency than we might otherwise anticipate from Arrow's analysis.⁷ Socialization and agreement on basic normative precepts diminish the probabilities of multi-peaked preferences, and certain symmetries of preference reduce the probability of a paradox occurring in a multi-dimensional world. Similarly, the molasses-like variability of political parameters, and the uncertainty and imperfect measuring devices of both practitioners and academics, bring into question the relevance of such precise mathematical analyses as those of Arrow and Black. Stated differently, we do not know the frequency with which the paradox occurs in reality. That the paradox *can* occur, nevertheless, raises an ominous note for democratic theory. Specifically, it decreases the probable parsimony of acceptable models. If social choices depend on the order in which motions are brought forward for a vote, or on the number of motions, or on the number of citizens voting, then those *ceteris paribus* conditions commonly scattered through academic tracts (such as this one) can be of considerable importance. We contend, therefore, that political lore, empirical generalizations, or simple graphic arguments are not satisfactory for understanding the political process. The primitive inquires of Hotelling and Smithies, and the verbal unidimensional elaborations of

⁶ Such situations are examined closely by James M. Buchanan, *Public Finance in Democratic Process* (Chapel Hill: University of North Carolina Press, 1967).

⁷ Gordon Tullock, "The General Irrelevance of the General Impossibility Theorem," *Quarterly Journal of Economics* (May, 1967). Richard G. Niemi presents an excellent formal treatment and interpretation of the probability of a paradox occurring in "Majority Decision-Making with Partial Unidimensionality," this *REVIEW*, LXIII (June, 1969), 488-497.

Downs, are inadequate. We also reject the argument that no generalization is possible, since such an assertion precludes all scientific inquiry. An adequate comprehension of political processes requires rigorous theory which specifies unambiguously the relationships between relevant parameters. We seek, therefore, a model which promises to satisfy eventually our notions of an adequate theory (or which at least is conformable to such a theory). Given this objective, we now consider more rigorously the definitions and assumptions which constitute the foundation of our model.

III. DEFINITIONS AND ASSUMPTIONS

A theory which seeks to explain how parties and candidates do act or ought to act is predicated on the citizens' responses to the candidates' strategies. And our preoccupation with the paradox of voting in section 2 suggests that such a theory is central to a spatial analysis of the electoral process. If we assume that parties and candidates waltz annually before a blind audience—that the electorate is neither attentive nor responsive to the candidates' maneuvers—then spatial analysis is not a requisite for understanding this waltz.

We conceptualize each citizen's choices and actions as the outcome of a two-stage sequential decision process. First, we assume that the citizen evaluates both candidates' (or parties') positions in terms of his own preferences; second, that he decides whether to vote or to abstain. If he votes he supports his preferred candidate. The sequential decision process is ordered in this fashion because the model postulates that the decision concerning whether to vote or to abstain depends upon the citizen's comparative evaluation of the candidates.

Every formalization, however, reveals the ambiguities associated with one's initial conceptualization of a problem. Consider, first, the central problem of ascertaining the method citizens use to compare candidates. Downs, as we note earlier, assumes that citizens compare the candidates' ideological closeness to themselves. The inadequacy of this conceptualization is that responses to campaign issues cannot be characterized as necessarily ideological.⁸ Al-

though some elections might involve a single issue, citizens' preferences cannot be ordered unambiguously on a single continuum. Opinion cleavages demonstrate that if spatial models are to retain descriptive and predictive value, they must allow for more than one dimension of conflict and taste.

This requirement first motivated our analysis. Instead of assuming that each citizen prefers one position on a common dimension, we assume that a citizen prefers a position on each of many dimensions. We represent a preferred position by a number, x , on the scale identified with each dimension. Consequently, for the i th citizen and the k th dimension the symbol x_{ik} indicates the position that a citizen, i , most prefers with respect to the dimension, k . We represent the i th citizen's preferred positions for all n dimensions by the vector,

$$(1) \quad x_i = \begin{bmatrix} x_{i1} \\ x_{i2} \\ \vdots \\ x_{in} \end{bmatrix}$$

This approach facilitates an analysis more nearly consonant with empirical evidence. For example, the complexity of modern society, the indeterminate implications of many policies, and the vagueness of political utterances guarantee the inability of even the most educated citizen to obtain a thorough knowledge and understanding of governmental policy and of the candidates' positions on issues. Thus, citizens employ criteria other than issues for evaluating candidates. The established fact that responses not related to issues (e.g., partisan identification, and candidate image) play significant, if not dominant, roles in determining electoral outcomes, however, does not vitiate the rationalistic perspective of voting behavior. Since our model is multi-dimensional, we can incorporate all criteria which we normally associate with a citizen's voting decision process—issues, style, partisan identification, and the like.⁹ The assumption that candidates,

(eds.), *The Electoral Process* (Englewood Cliffs: Prentice-Hall, 1966), 175–207; Donald E. Stokes, "Spatial Models of Party Competition," this REVIEW, LVII (June, 1963), 368–377.

⁸ V. O. Key, *Public Opinion and American Democracy* (New York: Knopf, 1963), Ch. 7; Phillip E. Converse, "The Nature of Belief Systems in Mass Publics," in David E. Apter (ed.), *Ideology and Discontent* (New York: Free Press, 1964), pp. 206–261; "The Problem of Party Distances in Models of Voting Change," in M. Kent Jennings, and L. Harmon Zeigler

⁹ The relative importance of issues, compared to image and partisan bias, as causal determinants of voting behavior remains an open question. Aggregate analyses of cross-sectional survey data demonstrate clearly the predictive dominance of partisan identification. V. O. Key, however, concludes in *The Responsible Electorate* (Cambridge: The Belknap Press of Harvard University Press,

parties, and public officials manipulate only governmental policy to win elections, therefore, is unnecessary.

Because a multi-dimensional model permits this latitude in the specification of the electorate's criteria for evaluating candidates, Downs' assumption of rational action is rendered less objectionable. Rationality in Downs' analysis ostensibly requires that each citizen has some information about the candidates' positions on issues. This information, however, is not free, and because many regard their votes as inconsequential, they avoid this cost by voting on the basis of the candidates' images or on the basis of socially determined partisan preferences.¹⁰ And since we interpret rational choice simply as choice which conforms to the assumptions of our model, voters are rational even though the candidates' positions on issues are disregarded.¹¹

Our analysis, moreover, is not sensitive to the number of relevant dimensions, or to their labels. The number and nature of issues change from election to election and it is doubtful whether anyone can successfully predict the issues that will be important in some future contest. These are parameters which must be ascertained empirically for each election.

The mathematical exercise of evaluating campaign strategies permits some ambiguity in the empirical referents for each dimension. The specification of the mathematical properties of the x_i 's, though, requires precision before rigorous analysis can proceed, and it is here that we constrain the realism of our model. First, *we assume that each dimension of taste is continuous*. This requires consideration of Stokes' observation that many dimensions are discrete and some are dichotomous (which Stokes terms "valence issues").¹² Conceptually,

1966) that policy counts heavily. Arthur S. Goldberg, moreover, demonstrates "that there is a rational component to party identification rooted in group norms" (p. 21) with the suggestion that these norms are related to issues, in "Social Determinism and Rationality as Bases of Party Identification," this REVIEW, LXIII (March, 1969), 5-25.

¹⁰ See Goldberg, *ibid.*

¹¹ This interpretation of rationality is equivalent to the *as if* principle of rational behavior as presented by Milton Friedman in "The Methodology of Positive Economics," *Essays in Positive Economics* (Chicago: University of Chicago Press, 1963). See also William H. Riker, and William Zavoina, "Rational Behavior in Politics, this REVIEW, LXIV (March, 1970).

¹² *Op. cit.* For a spatial analysis of discrete dimensions see Chapman, *op. cit.*

valence issues present no serious additional problems for the analysis of voting behavior. It is difficult, however, to mix continuous and discrete dimensions in one mathematical model, so we assume continuity simply to facilitate our analysis.

Stokes's observation, nevertheless, is pertinent. If, for example, only two spatial positions (e.g., party identification in a two-party system) are available, the candidates generally are unable to vary their positions. But the candidates may employ alternative means for influencing the electorate, such as varying the saliency of their party identification by stressing their party labels differentially. Although the analysis of strategies which have no spatial location can be conducted within the framework of our model, we focus here on the analysis of spatial strategies only.

Two additional assumptions implicit in our formulation of each citizen's preferred position must also be identified. First, *we assume that citizens act as if they estimate a preferred position for every dimension*. Thus, we ignore the possibility that citizens frequently do not or cannot evaluate alternative proposals for many issues. Second, *we assume that all citizens use the same indices to measure any given policy*. Stated differently, the indices measuring the various policies are common to all voters. Thus, we fail to consider Stokes's suggestion that "we may . . . have as many perceived spaces as there are perceiving actors."¹³

Even with these assumptions we must find a more convenient summary for our information about the electorate's preference before analyzing spatial strategies. Such a summary is obtained by observing that the vectors represented by expression (1) are not simply a collection of numbers; they also define a multi-dimensional coordinate system. Thus, the vector x_i , which represents the i th citizen's preferred position, identifies that citizen with some point in an n -dimensional coordinate system, where the citizen's preference on the k th dimension is measured along the k th axis of the coordinate system.

Assuming now that the preferred positions of all citizens are ascertained, we estimate the probability that a citizen, selected randomly from the electorate, prefers a particular position, say x_0 , by counting citizens preferring x_0 and dividing this number by the total number of citizens. When this calculation is performed for all preferences we plot a multivariate density of preferences, $f(x)$, which characterizes the population in the sense that it represents a summary statement of the preferred positions of all

¹³ *Ibid.*

citizens. We present in Figure 3 a unidimensional example in which a citizen, selected at random from the electorate, prefers x_0 with the probability $f(x_0)$.¹⁴ Figure 4 graphs a two-dimensional example in which a citizen, selected at random from the electorate, prefers x_{01} on the first dimension and x_{02} on the second dimension with the probability $f(x_{01}, x_{02})$.

The positions which a citizen prefers, however, are only a partial identification of the variables relevant for describing his calculus of voting. The act of voting implies a choice among candidates, so we require a representation of such alternatives. Additionally, since we assume that these choices involve a comparison of the alternatives and the citizen's preferred positions, we require that the representation of these alternatives conforms to expression (1). Since vectors characterize the citizen's preferences, and since a citizen's choice involves a comparison between these preferences and his perception of each candidate's position on each dimension, we assume that these positions also can be characterized by a vector. Thus, we let vector,

$$(2) \quad \theta_j = \begin{bmatrix} \theta_{j1} \\ \theta_{j2} \\ \vdots \\ \theta_{jn} \end{bmatrix}$$

represent the citizen's estimate of candidate j 's position on each dimension.

Although we represent the perceived position of each candidate as a vector, we cannot

FIG. 3

¹⁴ The densities illustrated in Figures 3 and 4 are represented as discrete although the scales are assumed to be continuous because electorates are finite populations. Nevertheless, our analysis is facilitated by assuming that $f(x)$ is continuous, which is not a serious distortion of any significance if the electorate is large. Hence, in all subsequent illustrations we represent $f(x)$ as a continuous density.

FIG. 4

assume that we know how citizens form estimates of θ_j . Downs, for example, offers several suggestions, such as estimating a candidate's strategy on the basis of past performance and probable future performance. But, like Downs, we cannot specify which suggestion is more satisfactory. Stated simply, a citizen's cognitive and evaluative processes are not sufficiently understood to permit us to identify the psychological mechanisms by which he forms estimates of θ_j .

But while the behavioral questions pertaining to θ_j remain unanswered, rigorous analysis can proceed only if we specify precisely the assumed mathematical properties of this vector. First, because we assume that θ_j is measured on the same dimensions as x_i , we also assume that θ_j is continuously measurable. Of greater substantive importance, however, is the additional assumption that *all citizens make identical estimates of θ_j* (thus we fail to subscript this vector with i —the citizen's index). Thus we ignore such problems as cognitive balance, imperfect information, and candidates' attempts to have different citizens believe different things about them.¹⁵ Repeatedly, we observe citizens

¹⁵ For a discussion of the role of cognitive balance see: Donald E. Stokes, "Some Dynamic Elements of Contests for the Presidency," this REVIEW, LX (March, 1966), 19-28; Bernard R. Berelson, Paul F. Lazarsfeld, and William N. McPhee, *Voting* (Chicago: University of Chicago Press, 1954), ch. 10; Michael J. Shapiro, "Rational Political Man: A Synthesis of Economic and Social-Psychological Perspectives," this REVIEW, LXIII (December, 1969). Cognitive balance poses a problem for our theoretical analysis, but it also reduces the validity of much cross-sectional survey research about attitudes and voting behavior. Briefly, the causal link between attitude (i.e., preference) and vote is bidirectional for many issues. Simply regressing attitude on vote does not reveal the importance of an issue for a citizen's choice—a significant

making "rational" decisions (i.e., decisions understandable to the observer) by their failure to perceive the disadvantages of an already preferred candidate and by failing to perceive the advantages of an already not preferred candidate. If, for instance, a voter favors the passage of strong civil rights measures and his preferred candidate does not, he may, nevertheless, believe this candidate favors such measures. The voter, furthermore, may guard against disruptive information by erecting a perceptual screen and filtering out dissonant messages. Party identification is known to bias citizens' perceptions of candidates' platforms, and highly salient issues often perform an equivalent function.

Such psychological possibilities identify an additional assumption of spatial analysis; we assume that the candidates have perfect spatial mobility (i.e., they can adopt any position in the relevant coordinate system). Perceptual distortion and imperfect information, however, frustrate a candidate's campaign objectives where, for example, citizens in a secure Democratic constituency favoring liberal labor legislation remain unconvinced that a Republican candidate is pro-labor—even though it is true. And in a multidimensional world candidates might find it impossible to alter their position on one issue without altering their positions on other issues.

A candidate, of course, prefers to have all citizens believe that he supports each and every preference (i.e., $\theta_i = x_i$ for all i) and if attainment of this ideal is impossible he should adopt the second best solution of approximating this ideal as closely as possible. Our assumptions, nevertheless, exclude this possibility, so the positions associated with a candidate cannot (except in a trivial instance) satisfy all citizens. Thus, to explain the choices citizens make when

regression coefficient may indicate only that the attitude has been made consistent with a predetermined preference because it is unimportant. Multiple regression analysis with many attitudinal variables, moreover, is not a satisfactory solution either. A statistically insignificant regression coefficient may indicate only that that variable is related to some other independent variable in the analysis although it may in fact be an important determinant of candidate preference. Because of such difficulties Gerald Kramer analyzes the relationship between policy preference and voting with variables which are more objectively measurable than attitudes in "An Empirical Analysis of Some Aggregative Hypotheses About U.S. Voting Behavior, 1896-1964," (unpublished, Yale University, 1968).

they regard neither candidate as perfectly satisfactory, we propose a measure of the citizen's evaluation of each candidate's position. Specifically, we provide for the loss in utility any citizen sustains when his preferred position is not supported by the candidates. We accomplish this end by introducing the concept of *individual loss functions*—functions which must satisfy several intuitively desirable properties before they are employed in the model.

First, if $x_i = \theta_j$ the loss citizen i sustains from candidate j 's position, symbolically written $L_i(\theta_j)$, should be at some minimum value or zero, since the candidate's position and the citizen's preference are identical for all dimensions.¹⁶ Consonant with this requirement, if $x_i \neq \theta_j$ (i.e., if at least one element of the vector x_i is not equal to the corresponding element in θ_j) the citizen should sustain a positive loss. Hence, we assume, *ceteris paribus*, that the greater the discrepancy between any element of x_i and the corresponding element in θ_j the greater is the loss citizen i associates with candidate j .

The mathematical formulation of these requirements is rendered difficult because: (1) the set of mathematical functions satisfying these two criteria is infinite, and; (2) the available empirical evidence fails to restrict this set sufficiently. The solution we propose for this problem is to conduct the analysis when only the general form of the loss function is assumed.

Consider the following expression as a potential specification for a citizen's loss function when the number of issues, n , equals 1.

$$(3) \quad a(x_{i1} - \theta_{j1})^2$$

The term $(x_{i1} - \theta_{j1})^2$ is the squared distance be-

FIG. 5

¹⁶ In some of our papers individual loss functions are symbolically represented by the function $\phi(x - \theta)$ to indicate that loss is a function of the difference between x and θ .

tween citizen i 's preferred position and candidate j 's position. If (3) represents a citizen's loss function and if $a > 0$, $a(x_{i1} - \theta_{j1})^2$ increases as x_{i1} and θ_{j1} become more disparate. (The magnitude of a is a function of the scale used to index the issue so we ignore it presently.) Furthermore, if $x_{i1} = \theta_{j1}$, $a(x_{i1} - \theta_{j1})^2 = 0$. Thus, expression (3) satisfies the two conditions which loss functions must satisfy. This function is illustrated in Figure 5.

Expression (3) however is not totally satisfactory since we must consider the possibility that $n > 1$. Suppose, therefore, that, if $n = 2$, we summed two such terms. Thus, another possible specification for the citizen's loss function is

$$(4) \quad a_1(x_{i1} - \theta_{j1})^2 + a_2(x_{i2} - \theta_{j2})^2$$

Observe now that this expression satisfies our first condition which loss functions must satisfy; if $x_{ik} = \theta_{jk}$, for $k = 1, 2$, the expression reduces to zero. Thus, if this expression represents a citizen's loss function, the citizen's loss equals zero whenever $x_i = \theta_j$. This expression, moreover, satisfies our second necessary condition: if a_1 , and $a_2 > 0$, $L_i(\theta_j) > 0$ whenever $\theta_j \neq x_i$. Thus, another reasonable assumption about individual loss functions is that they are represented by expression (4). Figure 6 graphs such a function.

If the election involves more than two issues we might continue adding the necessary terms to (4). But this expression ignores one possibility—that the loss a citizen derives from a candidate's position on one issue is a function of the candidate's positions on other issues. So we add the interaction term $a_{12}(x_{i1} - \theta_{j1})(x_{i2}$

FIG. 6

$-\theta_{j2})$ to (4) to account for this possibility. Thus (4) becomes,

$$(5) \quad a_1(x_{i1} - \theta_{j1})^2 + a_2(x_{i2} - \theta_{j2})^2 + a_{12}(x_{i1} - \theta_{j1})(x_{i2} - \theta_{j2})$$

If we graph expression (5) it resembles Figure 6—the graph of (4)—except that now it is rotated either to the right or left (depending on the magnitudes of a_1 , a_2 , and a_{12}).

For $n > 2$, expression (5) is easily generalized to,¹⁷

$$(6) \quad \sum_{m=1}^n \sum_{k=1}^n a_{mk}(x_{im} - \theta_{jm})(x_{ik} - \theta_{jk})$$

Thus, expression (6) represents the weighted (where the weights are the a_{km} 's) sum of squared distances (the terms for which $k = m$) plus the interaction terms between each pair of dimensions ($k \neq m$).

It remains, however, for us to interpret more precisely the weights in (6). To do so we return to the case of $n = 2$ —expression (5). If a_2 and a_{12} equal zero we say that only issue 1 is salient for the citizen and expression (5) reduces to (3). Consider a second example: assume that both dimensions are measured in terms of dollars spent on a program so that θ_j reads "candidate j wishes to spend θ_{j1} dollars on the first program, and θ_{j2} dollars on the second program." Assume, furthermore, that,

$$\theta_1 = \begin{bmatrix} \$1 \\ \$1 \end{bmatrix}, \quad \theta_2 = \begin{bmatrix} \$3 \\ 0 \end{bmatrix}, \quad a_{12} = 0$$

¹⁷ In matrix notation, expression (6) becomes

$$(x_i - \theta_j)' A (x_i - \theta_j)$$

where $(x_i - \theta_j)'$ is the transpose of $(x_i - \theta_j)$, i.e.,

$$(x_i - \theta_j) = \begin{bmatrix} (x_{i1} - \theta_{j1}) \\ \vdots \\ (x_{in} - \theta_{jn}) \end{bmatrix},$$

$$(x_i - \theta_j)' = (x_{i1} - \theta_{j1}, \dots, x_{in} - \theta_{jn})$$

and where A is the $n \times n$ matrix of weights, i.e.,

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \cdot & \cdot \\ \vdots & \vdots & \cdot & \cdot \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix}$$

This expression is generally referred to as the quadratic form. We can guarantee that the quadratic form satisfies our requirement that it be greater than zero if $x_i \neq \theta_j$ if we assume that A is an $n \times n$ symmetric (i.e., $a_{km} = a_{mk}$) positive definite matrix. This assumption implies no substantive restrictions on our model since we simply eliminate with it citizens who do not care about any issue (i.e. $A = 0$). For a discussion of quadratic forms see George Hadley, *Linear Algebra* (Reading: Addison Wesley, 1961), 251–263.

and that citizen i prefers spending no money, i.e.,

$$x_i = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Substituting these vectors into (4) (or, equivalently, into (5) since $a_{12}=0$), we get,

$$L_i(\theta_1) = a_1 + a_2$$

$$L_i(\theta_2) = 9a_1$$

Although the first candidate proposes to spend two dollars and the second candidate proposes to spend three dollars, the losses associated with each candidate are identical if $a_1 + a_2 = 9a_1$, or, equivalently, if $a_2 = 8a_1$. Thus, because of the unequal weighting of the issues, the losses a citizen associates with two candidates can be equal even though the candidates adopt dissimilar programs.

With this simple example we might be tempted to conclude that whenever $a_k > a_m$, issue k is "more salient" than issue m . Observe, however, that in this example we assume that the scales of both dimensions can be represented by a common measure, dollars. In general, campaign issues have no commonality of measurement and, additionally, the units of measurement for each dimension may be arbitrary. If, in the previous example, the second dimension is measured in cents, then

$$\theta_1 = \begin{bmatrix} \$1 \\ 100¢ \end{bmatrix} \quad \theta_2 = \begin{bmatrix} \$3 \\ 0 \end{bmatrix}$$

and the necessary condition for equality of losses becomes $a_2 = .0008a_1$. Thus, when both dimensions are measured in dollars equal losses requires that $a_2 > a_1$, but when the second dimension is measured in cents equal losses requires that $a_2 < a_1$.

This example reveals an important property of the a 's—their relative magnitudes are dependent on the scales of measurement which are applied to each dimension. And since we do not know either the scales which might measure all conceivable dimensions, the relative importance citizens attach to each dimension, or the prior identification of salient issues, the proof of our theorems should not require knowing the values of the weights.¹⁸ Thus, we at-

tempt to avoid the criticism that it is difficult, if not impossible, to estimate these weights in any real campaign by proving theorems which are insensitive to the magnitudes of the a 's.

We note, however, that in our development of a citizen's loss function, the weights are not subscripted by i ; the weights are assumed to be common to all voters. This assumption, which is used in the earliest developments of our basic model, implies that the electorate is homogeneous. In other words, no restrictions are placed upon the preferred positions, so that citizens can desire widely different policies, but the assumption implies that all citizens assign the same relative weight to any dimension. Consider the issue of school desegregation. The model allows some citizens to desire segregated schools and other citizens integrated ones. The assumption that the weights are common to all citizens, however, implies that everyone assigns the same degree of importance to the issue. The model does not allow some citizens to be concerned while others do not care whether or not schools are integrated.¹⁹

Clearly, different citizens may not assign the same degree of importance to any issue. Yet the decision to allow individual loss functions to vary is not easily transferrable into a tractable model. Perhaps a natural method would be to assign different a 's to citizens, but such a step results in a model whose complexity appears to prohibit the realization of meaningful analytical results. Accordingly, we utilize a simpler approach.

We assume that there exists some average level of concern for each issue and, if individual variations are permitted, these variations are represented as deviations from this average. *We assume, additionally, that the patterns of individual variations in level of concern do not correlate with preference.*²⁰ This assumption appears to conflict with the proposition that a citizen is more likely to react intensely about an issue if he prefers an extreme rather than a moderate position. If the proposi-

so that the indifference contours for a citizen's loss function are concentric circles.

¹⁹ The assumption of a common A matrix does not imply an interpersonal comparison of utility. It implies that, when the loss functions for citizens are ascertained independently, there exists a monotonic transformation on each loss function such that all loss functions have a common A matrix in one coordinate system.

²⁰ When nonvoting (which is discussed later) is caused by alienation, we must assume that variations in level of concern are *independent* of preference—a somewhat stronger assumption.

¹⁸ There exists, moreover, a linear transformation on the axes so that any quadratic of the form $(x-\theta)'A(x-\theta)$ can be reduced to $(x-\theta)'(x-\theta)$ without loss of generality (i.e., A becomes the identity matrix I). Thus, without loss of generality, we can assume that

$$L_i(\theta_j) = \sum_{k=1}^n (x_{ik} - \theta_{jk})^2$$

tion is correct, however, one should anticipate that relatively large and positive deviations from average concern will be associated with citizens who prefer either extreme on an issue; so there may be a zero correlation, although intensity and preference are not really independent.

If we accept expression (6) as an adequate representation of a citizen's loss function, however, we also accept the assumption of marginally increasing loss (i.e., as the citizen's preference on any dimension and a candidate's position on that dimension become more disparate, the loss which the citizen associates with this candidate increases at an increasing rate). Marginally increasing loss, however, is a hypothesis which may be disconfirmed empirically and which can be an unnecessary assumption. A more general formulation of the loss function is one which permits marginally decreasing, as well as marginally increasing, loss.²¹ Such a formulation permits loss functions similar to the one illustrated in Figure 7 (and since the loss function illustrated in Figure 6 is also consistent with this assumption we employ this weaker assumption whenever possible).

Note now, from Figure 7, that this assump-

FIG 7

²¹ Mathematically, we may assume that $L_i(\theta_j)$ is a function, ϕ , of the quadratic form. Thus

$$L_i(\theta_j) = \phi((x_i - \theta_j)'A(x_i - \theta_j))$$

where ϕ is any monotonically increasing function of its argument. Note that if $A = I$, the citizen's indifference contours remain concentric circles under the transformation ϕ .

FIG. 8

tion allows variations in θ_j to have little impact on $L_i(\theta_j)$ for θ_j significantly different from x_i —the citizen can become indifferent between alternative positions if they are already quite far from his preferences. Citizens with such loss functions might, for example, be those who refuse to distinguish between two candidates if neither is regarded as satisfactory. Alternatively, citizens with loss functions such as the one illustrated in Figure 6 continue to discount heavily the candidate's movement as he proceeds farther and farther away from their preferences. But for neither situation is the citizen's loss permitted to decrease as θ_j and x_i become more disparate.

Thus, we come full circle to our discussion in the previous section of single peakedness and majority decision-making. Consider the following example: assume that citizens are asked to reveal their preferences for alternative tax rates. Some citizens may base their preference on the theory that "the lower the taxes the better." Others may believe that a certain amount of government activity is necessary, differing among themselves only on the amount. They prefer some intermediate tax rate. A third set of voters, however, seeks to insure the adequate financing of current programs and, consequently, favors a substantial increase in the tax rate—as opposed to an incremental increase—so that additional programs can be financed optimally. A prospective loss function for this type of citizen which fails to satisfy our assumptions is depicted in Figure 8.

From the mathematical perspective of our assumptions the occurrence of such functions offers no problem. We can satisfy our assumption about the form of the loss function if we increase the dimensionality of the analysis—by decomposing one dimension into two or more (e.g., reversing the process of factor analysis). But if loss functions on tax policy, for example, are similar to the function illustrated in Figure 8, and if our assumptions are satisfied

by decomposition, what substantive political interpretation can be given to these new dimensions? We begin with a politically meaningful dimension—tax policy—which we assume has substantive meaning for both citizens and candidates. Can we assume further that the derived dimensions have substantive meaning? Are the candidates able to formulate policies on these dimensions?

Riker suggests a tentative answer to these questions:

If the preference curves are single peaked, then . . . there exists a common qualitative dimension along which all preferences are ordered . . . the single peaked curves . . . reflect a cultural uniformity about the standard of judgment.²²

If this "standard of judgment" is not uniform—if preferences are not single peaked—then the mathematical exercise of increasing the dimensionality of the analysis should discover the underlying multiple standards. And we assume, furthermore, that the candidates are able to formulate and manipulate policy on these standards. Consider again Figure 8. Our assumptions about loss functions might be satisfied if, for instance, we substitute two dimensions—efficiency in government spending, and government involvement (e.g., in welfare)—for the single dimension of tax policy. Thus we speak of the issues in the campaign as being efficiency and government involvement, but tax policy, per se, is not an issue.

We can now specify the citizens' rules for candidate preference. Generally, we assume that there are two candidates, and we denote the position of the first candidate as θ_1 and the position of the second candidate as θ_2 . From the definitions of rationality and individual loss functions, a citizen prefers that candidate whose position yields him the smaller utility loss. Symbolically, the i th citizen prefers the first candidate if,

$$L_i(\theta_1) < L_i(\theta_2),$$

he prefers the second candidate if,

$$L_i(\theta_1) > L_i(\theta_2),$$

and he is indifferent between the candidates if,

$$L_i(\theta_1) = L_i(\theta_2).$$

We assume, moreover, that if a citizen votes, he votes for the candidate he prefers. Thus, we do not consider the possibility that citizens disguise their preferences by voting against a preferred candidate. Farquharson demonstrates

that in small committees such strategic behavior can be fruitful if the paradox of voting exists or can be generated.²³ Such falsifying strategies in large electorates, however, seem worthless, since one citizen can have only an infinitesimal effect on the overall electoral preference. For large subgroups of the electorate, however, preference falsification can be rewarding, so we cannot guarantee that some citizens fail to perceive and to employ this strategy. Nevertheless, we assume that such behavior does not exist (rather than proving it does not exist or incorporating it somehow into the model).

Our assumptions concerning candidate preference and choice, however, describe only the first stage of the citizen's two stage sequential decision process. The second stage is the choice between voting for a preferred candidate or abstaining. First, some of the results reported in this essay require the assumption that all citizens vote. And for an electorate in which as many as 83 per cent of all eligible citizens vote (e.g., the 1960 Presidential election) and in which we can attribute most non-voting to habit or special circumstances, this assumption is not unduly restrictive.²⁴ Conversely, electoral outcomes frequently are determined by variations in turnout and other forms of participation (e.g., contributing money, ringing doorbells), and to the extent that the decision to vote or to participate otherwise is a function of the candidates' strategies, we require a theory about participation.

Presently we consider only variations in turnout, but in the final section of this essay we discuss how our analysis might be extended to include other forms of participation. The decision to vote is posited to involve a comparison of the relative expected utility from voting and not voting. Only if the expected utility of voting is greater than that of abstaining is it rational to vote. Riker and Ordeshook analyze this expected utility calculation and express

²³ *Theory of Voting* (New Haven: Yale University Press, 1969). For examples of the occurrence of paradoxes in legislatures and possible occurrences of contrived paradoxes see William H. Riker, "The Paradox of Voting and Congressional Rules for Voting on Amendments," this REVIEW, LII (1958), 349-366, and "Arrow's Theorem and Some Examples of the Paradox of Voting," in J. M. Claunch (ed.), *Mathematical Applications in Political Science* (Dallas: Arnold Foundation, SMU Press, 1965).

the expected utility of voting hypothesis as,²⁵

$$(7) \quad R = PB + D - C$$

where:

P is the citizen's subjectively estimated probability that his vote materially affects the outcome,

B is the absolute value of the subjective differential loss (or utility) between the candidates,

D is the utility a citizen derives from participating in the electoral process—termed the citizen's sense of duty,

C is the subjectively estimated cost of voting,

R is the expected utility of voting less the expected utility of not voting.

Thus, the citizen votes if and only if $R > 0$, and he abstains from voting if and only if $R \leq 0$.

The earlier analysis of equation (7) demonstrates the necessity for inclusion of the PB term, and, specifically, how P might be calculated. Presently, this equation serves as an *indicator* of the relevant factors in a citizen's decision to vote. The equation, however, must be augmented by a specification of these factors' relationships to the candidates' strategies.

We consider two causes of abstention: (1) indifference and, (2) alienation.²⁶ First, a reasonable interpretation of B suggests that it is not independent of the candidates' strategies, and this relationship, termed *indifference*, can be represented by the variables employed in our model.²⁷ From the definition of B and of the loss functions, it follows that,

$$B_i = |L_i(\theta_1) - L_i(\theta_2)|$$

where $|\cdot|$ means "absolute value of."

Thus B and, therefore, R, the utility of voting, decrease as the losses associated with both candidates become less disparate. Additionally, if we assume that factors other than P, B, D, and C affect R, and that these factors have random effects on the citizen's expected utility calculations, then, with the present formulation of abstention from indifference, we can assume that *a citizen's probability of voting decreases as the difference between losses which he associates with each candidate becomes less distinct.*

This assumption, however, appears to ignore the possible effects the candidates' strategies

might have on the citizen's sense of civic duty, D, which appears to be largely the product of long-term socialization (e.g., learning or long-term reinforcement through non-voting). We consider the potential short-term effects on D, nevertheless, and assume that *a citizen's probability of voting decreases as the loss he associates with his preferred candidate increases and that his probability of voting increases as this loss decreases.*²⁸ Thus, if we say that a citizen's decision to vote is a function of alienation, we mean that in the short run he identifies a preferred candidate, and, if this candidate is not deemed to be satisfactory, the citizen abstains.

Both assumptions—alienation and indifference—have intuitive appeal and it is probable that both operate to some extent in all electorates. We consider each assumption separately, however, to provide ourselves with a tractable mathematical model. We do not consider, though, one potentially important effect on turnout which is represented in (7) by P, the subjective probability of affecting the outcome. We ignore P not because we consider its effects unimportant, but because it would be difficult to include it and because it does not affect many of our results. Generally, we wish to ascertain the dominant spatial positions in a campaign. Our analysis focuses primarily on perfect competition and on equilibrium states; under such conditions P is maximized, identical for all conditions, and can be ignored with some justification.

The list of assumptions which constitute the foundation of our model is now completed. We proceed to the specification of dominant campaign strategies. Note, however, that ascertaining dominant positions or dominant ranges of positions should not be interpreted as presuming that these are in fact the strategies candidates adopt in elections. Candidates obviously have neither the luxury of perfect spatial mobility nor the endowment of perfect information about citizens' preferences. Ascertaining the electorate's preference is one of the difficult objectives for candidates in campaigns. Thus, we assume only that on the average (or in the long run) candidates act in accordance with the model. Deviations from the predictions of our model are expected to occur. We hope, nevertheless, that the model describes and explains some fundamental forces operating in democratic electoral systems and, by a process of Darwinian selection, that these deviations occur around a mean which the model predicts. We turn now to a description of these forces

²⁵ "A Theory of the Calculus of Voting," this REVIEW, LXII (March, 1968), 25-42.

²⁶ Our assumptions about nonvoting conform closely to the two factors Garvey (*op. cit.*) identifies.

when the electorate's preference is best described by a single multivariate density.

IV. ELECTORAL STRATEGIES WITH A SINGLE DENSITY

Since dominant strategies generally do not exist in a multi-dimensional world, one objective of our analysis is to find conditions which yield dominant positions. In other words, our model should be interpreted as an attempt not only to correct the flaw of unidimensionality attributed to Downs, but also to specify conditions sufficient for majority rule. First, we consider two-candidate competition when the electorate's density of preferences is distributed unimodally. Second, the situation when the electorate's density of preferences is unknown is explored. Third, the effect of increasing the dimensionality of the election (i.e., the effect of variations in n , the number of issues) is analyzed. Finally, we consider competition when the electorate's density of preferences is bimodal.

Prior to beginning the analysis, however, we shall assume that the candidate's objective is to maximize his plurality. Although the rewards candidates seek vary (e.g., some candidates might desire idiosyncratic benefits from political activity), it is important to note that winning, at the very least, is instrumental for realizing most such goals. We assume plurality maximization, rather than vote maximization, because if winning is his criterion, a candidate must consider the votes his opponent receives as well as the votes which he receives.²⁹ A candidate must receive a positive plurality to win—not simply “many” votes. Even for those candidates who cannot win because of the historical prejudice of the voters of some districts (e.g., the one-party South), or those who do not seek to win (e.g., candidates who require ideological purity), the standard measure of performance is the disparity between a candidate's votes and the votes which his opponent receives. Thus, in game theoretic terms, we assume that elections are two-person zero-sum games.

It is possible to specify, with this game theoretic assumption, conditions that guarantee the dominance of a single position for *any* number of dimensions. The most prominent of these conditions is the symmetry and unimodality of

the electorate's preference density. By unimodality we mean that the preference density, say $f(x)$, has a single mode (e.g., the normal density function). Symmetry implies that if, for example, the mean of $f(x)$ equals zero, the probability that a randomly selected citizen prefers the position x equals the probability that he prefers the position $-x$ (i.e., $f(x) = f(-x)$). Thus, symmetry requires that there exists for every citizen with a given preference, another citizen with a diametrically opposed preference. An example of a symmetric, unimodal density in two dimensions (Figure 9) consists of a density whose contour lines are concentric circles or ellipses.

The dominant position for these densities is μ , the vector of the means of the preferred points for each dimension. Thus, *if $f(x)$ is symmetric and unimodal, a candidate cannot be defeated if he adopts a position equal to the mean of the electorate's preference on each dimension, and this conclusion is valid if all citizens vote or if citizens abstain from voting because of alienation or indifference.*

Assuring that conditions exist in a multi-dimensional contest which guarantee the existence of dominant positions should not obscure the eminent restrictiveness of these conditions. It is unlikely that the electorate's preference is perfectly symmetric, even though the proof of the above theorem assumes perfect symmetry. On the other hand, symmetry and unimodality are merely sufficient conditions, and dominant positions can exist for preference densities which do not have these characteristics. Nevertheless, one should not presume the existence of dominant positions.

FIG. 9

²⁹ For an analysis of electoral strategies when vote maximization is the posited goal see Hinich and Ordeshook, "Plurality Maximization vs. Vote Maximization: A Spatial Analysis with Variable Participation," this REVIEW (forthcoming, September 1970).

This latter bleak possibility can be emphasized by returning to the simplistic Downsian world of unidimensional competition. Black demonstrates that if preferences are single peaked and if all citizens vote, a dominant position exists at the median. Furthermore, this result does not require symmetry of preferences. Note, however, that if a new feature is introduced into Black's analysis—if citizens are permitted to abstain—then this feature can preclude the existence of any dominant position under conditions equivalent to those that Black examines. Specifically, if $f(x)$ is a non-symmetric, unimodal, and unidimensional density, and if all citizens are assumed to vote, a dominant position will exist. On the other hand, if citizens can abstain because of indifference, then dominant positions, in general, do not exist.³⁰ This conclusion suggests that dominant positions are more unlikely in a multi-dimensional world, and especially one in which there is abstention, than either Arrow or Black suggest.

Let us now turn to unidimensional competition with abstention from alienation. If $f(x)$ is not symmetric, necessary and sufficient conditions for dominance are mathematically complex thus rendering difficult any substantive interpretation of the conditions. We have been unable to ascertain whether or not these conditions are satisfied for all unimodal densities of preference. These problems manifestly justify further rigorous investigation of Downs's assertion that candidates converge to a unique position when the electorate's density of preference is unimodal.

Two interesting and important observations can be culled from the conditions for dominance in unidimensional competition when $f(x)$ is unimodal and when abstention from alienation is allowed. First, if a dominant location exists, its location is, *ceteris paribus*, a function of the sensitivity of a citizen's probability of voting to variations in his preferred candidate's strategy—referred to as the *sensitivity of turnout to variations in strategy*. If this sensitivity is low the dominant position is near or at the median of $f(x)$, if sensitivity is high, the dominant position is near the mode, but if this sensitivity is at some intermediate value the dominant position is typically not near the median or the mode. Substantively, consider the logical situation of a citizen's probability of voting being inversely related to his cost of voting. Obviously, by selectively varying such costs the

probabilities that certain citizens vote can be altered so as to change the policies candidates should adopt. Assume, however, that the cost of voting is varied *uniformly* throughout the electorate. Because a uniform variation increases every citizen's sensitivity (by definition) *electoral outcomes also are altered by uniform variations in the cost of voting*. Thus, such factors as the availability of polling stations, and *progressive* poll taxes affect the social choices which elections might produce.

A second observation concerns the strategy that a candidate should adopt if his opponent selects a non-optimal strategy. Consider three situations: (1) the opponent is near the dominant position; (2) the opponent is far from the dominant position; and (3) the opponent adopts some intermediate strategy. If $f(x)$ is unimodal and univariate, and if alienation causes abstention, a candidate who seeks to maximize his plurality adopts the following position for these three situations: (1) near the dominant position and closer to it than his opponent; (2) near the dominant position; and (3) near his opponent but closer to the dominant position than his opponent. Thus, if $f(x)$ is symmetric, and if we conceive of a situation in which the opponent shifts his strategy from the median to some extreme position, one can plot the candidate's plurality maximizing position against his opponent's position. Thus in Figure 10 the two axes measure the same unidimensional space but with one axis being reserved for one candidate and the other for his opponent so that the line (which does not represent a density) traces out the optimal position for the candidate if his opponent takes any given position.

Observe from this illustration that the candidate adopts a strategy near the dominant position (the median, which is represented here as the origin) if his opponent is either close to or far from this position. Thus, to contradict an observation made by Tullock (in reference to situations with all citizens voting) *if alienation causes abstention, the presence of an extremist opponent should not draw the candidate far from the equilibrium point*.³¹ A plurality maximizing candidate has an incentive to diverge significantly from this point only if his opponent is at some "reasonable" distance from the dominant position. This suggests an intuitively appealing strategy for candidates who do not seek to win but who simply wish to create incentives for other candidates to shift their positions—adopt a moderate as opposed to an ex-

³⁰ A counter example to dominance is presented in Ordeshook, "Some Extensions . . .," *op. cit.*

³¹ Gordon Tullock, *Toward a Mathematics of Politics* (Ann Arbor: University of Michigan Press, 1968), p. 52.

FIG. 10

treme position. Perhaps we have here an explanation for Goldwater's failure to influence Johnson's strategy of consensus.

Even with this interesting observation we must consider the situation in which no dominant position exists; specifically, one might desire to ascertain what bounds a rational candidate should place on his strategy (i.e., what region dominates alternative regions). Briefly, if everyone is assumed to vote and if little is known about the multivariate density of preference, $f(x)$, one can derive bounds on the relative distance from the mean a candidate can get before he insures that his opponent wins. We can show that if θ_2 is farther than two standard deviations from the mean of $f(x)$ than is θ_1 , then the first candidate is certain to win. If a candidate's position is close to the mean of $f(x)$, then his opponent either should adopt a position which is also close to the mean or should face the consequence of losing the election with certainty. Alternatively, if his opponent adopts a platform distant from the mean, the candidate is afforded greater freedom in the positions he may adopt without insuring that his opponent wins.

The importance of the mean becomes more impressive if we imagine a situation in which the first candidate selects the mean as his strategy and his opponent adopts some other position. *If the number of dimensions required to describe the preferences of citizens increases, the proportion of the vote received by the first candidate increases; and if the number of dimensions goes to infinity, the first candidate receives all the votes.* Thus, as the number of issues increases, the strategic importance of the mean as the focal point of the candidates' strategies increases.

This result demonstrates that varying the number of relevant issues is a potentially valuable campaign strategy. Candidates in strategically advantageous positions should increase the dimensionality of the contest while candidates in disadvantageous positions should simplify the election (i.e., reduce the dimen-

sionality) in addition to shifting to a dominant position. Note also that this result complements the intuitively satisfying notion that if a candidate is in a strategically advantageous position on a number of issues, he should attempt to increase the relative importance of these issues in the campaign.

We conclude that *as the number of issues increases, the electoral significance of candidates who advocate extreme positions decreases.* Obviously, the number of relevant issues varies from campaign to campaign. The cause of the variation is found, *inter alia*, in the exigencies of events, the candidates' focus on issues, and an increasingly pluralistic society. Perhaps as the electorate becomes more sophisticated, the number of dimensions required to represent issues increases. The civil rights "issue," for example, is no longer restricted to questions of voting and desegregation. Jobs, housing, business ownership, income distributions, and health, are now also components of this issue. Thus, assuming that responses unrelated to issues do not increase, then as a society grows more complex and the electorate more sophisticated, the chance that an extremist candidate might win is correspondingly diminished. One can also infer that the electoral fortunes of third parties are greatest when the number of issues is small, *ceteris paribus*. This inference is supported by the observation that, historically, the genesis of minor parties involves a single and dominant issue, and that any subsequent increase in the dimensionality of competition is accompanied either by a decrease in the fortunes of such parties, by their absorption by a major party, or by their replacement of a major party.

It is legitimately argued that individual voters do not perceive, and especially do not have feelings about, the entire spectrum of issues. Instead, voters are characterized as being concerned with a narrow subset of issues with the contents of the subset varying from voter to voter. Thus, farmers are supposed to care about farm price supports and those associated with the petroleum industry are supposed to be concerned with oil import quotas while the rest of us hardly even know about, and certainly are not concerned with, these issues. As the model is stated earlier, it does not include this type of phenomenon. However, with suitable assumptions, it is possible to show that our results concerning the dominance of the mean are valid for the special case in which each voter is concerned with a single issue, but in which the issue varies from voter to voter. Specifically, if we compute the mean preference for each issue by counting only those who care

about that particular issue, and if there is a symmetric preference density, then the mean vector is dominant. Also, if one candidate advocates policies which are "closer" to the vector of means than his opponent's vector, and if everyone votes, then the former candidate wins the election. Thus, our basic results obtain even if voters care only about a single issue which varies from citizen to citizen.

Thus far, however, our discussion considers competition only if $f(x)$ is either unimodal or unknown, though many electoral contests are interesting because the electorate's preference is distributed bimodally. Bimodal distributions indicate the presence of only minimal consensus, and it is competition without consensus which is of most interest for speculating about the selection of public policies by election. It is here, moreover, that we begin to uncover instances when candidates should not converge.

The results of our analysis of bimodal distributions are best expounded if we contrast these results with those achieved when preferences are distributed unimodally. In Table 1 we summarize our results.

Notice that *electoral outcomes differ between unimodal and bimodal densities only if alienation causes abstentions*. Thus, if all citizens vote or if indifference causes abstentions, the candidates should converge to the mean. One of us discusses this conclusion elsewhere within the context of the responsible parties controversy. Specifically, internal party discipline and an ability to implement programs to which the electorate has given its consent are not sufficient conditions for distinct programs.³² This conclusion is doubtless disconcerting to proponents of a responsible two-party system. Normatively, many of us might feel that whenever preferences are bimodally distributed the two modes of opinion should be represented. Consider, as an example, a situation in which

the society is governed by an omniscient and beneficent dictator faced with the task of selecting the "best" policies for his country, and where citizens' loss functions are marginally increasing (see Figure 6). The dictator should realize that in any nontrivial situation there is no possibility of satisfying everyone so he must select some scheme for evaluating the relative importance of the society's citizens—some scheme for making interpersonal comparisons of utility. Suppose that the dictator makes the judgment that such comparisons are meaningful, and decides that everyone should be weighed equally. These judgments imply that the best policies are those which minimize the total utility loss of the society. The dictator accomplishes this objective by selecting a position identical to the average desires of the population, so he selects the mean. Hence, competitive conditions which cause the two parties to converge toward the mean result in the electoral process producing the kind of result that a beneficent dictator should choose. This result, of course, although it does tend toward minimal utility losses, is quite contrary to the responsible party doctrine.

The beneficent dictator's preference for the mean is, in fact, more pervasive than the example might suggest. Instead of weighting each citizen identically, assume that the i th voter, with the preference vector x_i , is assigned the weight $w(x_i)$. Assume also that $w(x)$ is symmetric about the mean of $f(x)$ so that $w(x) = w(-x)$ if the mean is zero. There are two general forms of the weighting function $w(x)$ which are of interest here. First, the beneficent dictator might assign more importance to those in the "middle" than to those who held extreme positions, and in this instance we say that $w(x)$ is unimodal. Second, the dictator might weight "liberals" and "conservatives" more heavily than the "moderators" and in this instance $w(x)$ is termed not unimodal. With these assumptions the dictator's preferences are presented in Table 2.

Thus, *if the citizens' loss functions are marginally increasing the dictator selects the mean for all symmetric $f(x)$ and $w(x)$* . Alternatively, if loss functions are both marginally increasing and marginally decreasing no general solution exists (unless $f(x)$ and $w(x)$ are both unimodal). The social welfare "optimality" of the mean, therefore, is sensitive to the form of the citizens' loss functions, as well as the density of citizen preferences. The point here, however, is that in a variety of situations, with a variety of ethical assumptions arbitrarily assigned, the mean appears to be a desirable point. Accordingly, contrary to the responsible parties doctrine, forces

TABLE 1.—LOCATION OF DOMINANT POSITION

Distribution	All Citizens Vote	Non-Voting Because of Alienation	Non-Voting Because of Indifference
Symmetric Unimodal	Mean	Mean	Mean
Symmetric Bimodal	Mean	No General Solution	Mean*

* This result assumes that individual loss functions are quadratic, i.e., expression (6). If these loss functions are simply monotonic functions of (6), e.g., see Figure 7, then there exists no general solution. This case, however, is not yet satisfactorily analyzed.

³² Ordeshook, *op cit*.

TABLE 2. DICTATOR'S PREFERENCE

$f(x)$	Loss Functions Marginally Increasing Only		Loss Functions Marginally Increasing and Marginally Decreasing	
	$w(x)$ Unimodal	Otherwise	$w(x)$ Unimodal	Otherwise
Symmetric Unimodal	Mean	Mean	Mean	No General Solution
Symmetric Bimodal	Mean	Mean	No General Solution	No General Solution

which cause both party platforms to converge toward the mean, rather than recognizing differences in opinion, are not necessarily "bad" and, in the majority of the above cases, are positively "good" if one is willing to accept the assumptions.

Returning to Table 1, note that no general solution exists when $f(x)$ is bimodal and alienation causes non-voting. To specify the location of the candidates' preferred positions we must consider two additional aspects of the model. These aspects are (1) restrictions on the candidates' strategies, and (2) the sensitivity of turnout to variations in strategy. First, if candidates are strategically unrestricted, then even for a single dimension, no dominant position, in general, exists. By imposing restrictions, nevertheless, equilibrium may be restored so that the candidates fail to converge and adopt strategies near the modes of $f(x)$. Specifically, if the candidates are restricted so that they cannot cross each other or cross the median, dominant strategies exist, and they can be different strategies for each candidate. And since both candidates converge to the mean if all citizens vote or if indifference causes abstentions, the only explanation for divergent positions (if candidates are afforded perfect spatial mobility) is that citizens abstain because of alienation.

This situation illustrates one of the values of formal mathematical analysis. Downs offers the intuitively satisfying but mathematically unproved proposition that whenever preferences are distributed bimodally, the forces of abstention prohibit rational candidates from converging. Our analysis demonstrates, however, that this proposition generally is false—restrictions on strategies may be necessary for equilibrium. We can also give meaningful interpretations to these restrictions. First, candidates may be committed ideologically and may be unwilling or unable to adopt platforms abridging such commitments. Second, a party's nomination is commonly a requisite for winning

the general election. The candidates, therefore, may find it necessary to make public commitments in conventions or in the primaries which bind them to these policies in the general election. Third, the electorate may associate traditional policies with a candidate and with his party and, therefore, strategies may be beyond the manipulative reach of the candidates except within a limited range. Finally, by crossing either the mean or his opponent's position, a candidate can alienate citizens—political activists, opinion leaders, and interest groups—whose support is vital. In electoral politics, citizens cannot be weighted in proportion to their numerical strength. If the preferences of activists differ from the preferences of the entire electorate, a candidate's optimal strategy should not be calculated from an unweighted aggregate density of preferences.

This last cause of strategy restrictions also offers an explanation of why candidates, who are afforded perfect spatial mobility, might not seek to converge when the mass electorate's preference is unimodally distributed. If the preferences of activists—citizens who are credited with disproportionately greater weights—are bimodally distributed, an electorate in which citizens are weighted in proportion to their potential contribution to a campaign, from a strategic perspective, may be equivalent to an unweighted electorate whose density of preferences is bimodal.³³ This idea is consistent with the observation that in competitive districts the legislative acts of Congressmen diverge more frequently from their constituencies' preferences than in less competitive districts.³⁴

³³ See, for example, Herbert McCosky, Paul J. Hoffman, and Rosemary O'Hara, "Issue Conflict and Consensus Among Party Leaders and Followers," this REVIEW, LIV (June 1960), 406-427, and; Samuel J. Eldersveld, *Political Parties* (Chicago: Rand McNally, 1964), ch. 8.

³⁴ Warren E. Miller, "Majority Rule and the Representative System of Government," in E.

It may be that competition forces Congressmen to assign disproportionate weights to activists, thereby affecting a bimodal distribution (even when the electorate's preference density may be unimodal). Thus, if candidates diverge and if preferences are arrayed unimodally, this should not be interpreted as a refutation of spatial models, but as an indication that the components of competition are far more complex than such simple minded tests.

Earlier we note that a second important consideration in the discussion of bimodal densities is the sensitivity of turnout to variations in strategy. Specifically, if this sensitivity is sufficiently low, the candidates converge to the mean. Thus, we find a second important qualification for Downs's analysis of such distributions of preference. *Candidates diverge when preferences are bimodally distributed and when alienation causes abstentions only if the sensitivity of turnout to variations in strategy is sufficiently great. Bimodal distributions and abstentions caused by alienation, then, are not sufficient conditions for non-convergence.* "Sufficiently great" is imprecise and most likely it must remain so. The incentives for convergence or divergence are sensitive to so many parameters of $f(x)$ and of turnout that generalization appears impossible. (It is possible, nevertheless, to ascertain dominant positions in specific instances.) We can generalize only by stating that, *as the sensitivity of turnout increases, the incentives for non-convergence increase if $f(x)$ is bimodal.*

V. ELECTORAL STRATEGIES WITH TWO DENSITIES

Having sketched some theoretical results for competition between two candidates in an electorate which is characterized by a single density of preferences, we now consider electorates characterized by two densities. Specifically, assume that the sum of two symmetric unimodal densities characterizes the electorate's preferences. This permits us to consider the phenomenon of political parties. We cannot analyze, of course, the detailed quality and variety of parties. It is possible to consider in these developments only some salient characteristics. Our approach to party politics assumes that a multivariate, symmetric, uni-

modal density characterizes the desires of the party membership and two (possibly overlapping) densities characterize an electorate of two competing parties. Additionally, assume: (1) all citizens vote; (2) candidates are first selected in primaries; (3) in primary elections citizens can only vote in their party's primary; and (4) in the general election citizens select the candidate whose strategy yields them the smallest loss without regard to party.

The term "without regard to party" may be viewed as a most unsatisfactory assumption. Previously, we indicate that a multidimensional model is valuable because partisan identification is admissible as an additional dimension of taste. However, it is now desirable to assume that partisan identification can be ignored—although this assumption is clearly contradicted by empirical fact. A solution to this *contretemps* is available. First, since the model permits as many dimensions of taste as necessary, one might assert that a substantial basis for party identification is found in these dimensions. Thus, if a sufficient number of dimensions is provided, we can minimize the distortion afforded by ignoring party identification. Alternatively, we may retain partisan identification as a dimension, say the n th, without affecting our definition of parties. We can analyze strategies, then, on the first $n-1$ dimensions and take cognizance of the citizen's bias inherent in the n th dimension.

The idea now is to utilize previous results to analyze the relationship between victory in the general election and the preferences of party identifiers. Thus, if candidacies are determined by primaries, a candidate is nominated whose position is identical with the mean vector of the preferred positions of the members of his party. Symbolically,

$$\theta_1 = \mu_1; \quad \theta_2 = \mu_2$$

where μ_1 and μ_2 are the means of the first and second parties' densities of preference respectively.

Imagine the means of the two densities being pulled apart or moved away from each other. In American politics, for example, the Democratic and Republican densities "overlap." However, as the means are moved further apart by shifting the distributions, this overlap diminishes until it vanishes. An illustrative, one-dimensional situation is set forth in Figure 11 in which no overlap exists. Obviously, since citizens select the candidate whose strategy is nearer their preferred position, at some point during the shifting all or nearly all citizens prefer the candidate of their party. In this instance the majority party always wins. The minority cannot exert an influence upon the formation of policy and is totally ignored. While

FIG. 11

the formal proof of this argument is of the limiting variety, the argument need not be stated here in such a form. The inference derived from the theorem is that, *ceteris paribus*, the greater the discrepancy between μ_1 and μ_2 , the less a minority party should favor government by simple majority rule.

Among the *ceteris paribus* conditions, however, are two important parameters of $f_1(x)$ and $f_2(x)$ —their variances. Considering the usual case in which overlap exists between the two densities, and assuming that the densities are normal or multivariate normal, it is possible to obtain some mathematically rigorous results. Assume that the preferences of the second party are more dispersed (in the sense that its members represent a “wider range” of opinion) than are the preferences of the first party. Two such distributions are represented for the unidimensional case in Figure 12.

Under these circumstances a necessary condition for the second candidate to win is that it be the majority party. Thus, a “dispersed” minority party, one which encompasses a much wider range of opinion than the majority party, cannot receive a positive plurality. An obvious corollary to this theorem is that *minority parties can win elections. Their chances increase, furthermore, as the range of opinion of their membership diminishes, ceteris paribus, relative to the dispersion of the opposition.* In the situation depicted in Figure 12 the first party, assumed to be a minority, might win, since the variance of $f_1(x)$ around μ_1 is considerably less than the variance of $f_2(x)$ around μ_2 . The discrepancy implies that the first party attracts more votes from the opposition than it loses from defections of its own membership. This point is intuitively satisfying and is useful for interpreting the efforts of minority parties to enforce a singleness of purpose and ideology in countries holding meaningful elections.

The preceding analysis assumes that each candidate adopts the mean vector of his party as his position in the general election. Obviously parties should not seek to constrain their

nominees to strategies reflecting solely the preferences of party activists. Otherwise, movement toward the mean of the opposition party, which might increase a candidate's probability of winning, is prohibited. This reasoning suggests an interesting conflict. The minority party has the most to gain by permitting its candidates to diverge from the party's preference, but it must work hard toward retaining its singleness of purpose. The internal tension of minority parties, therefore, is the tempering of ideological purity with the necessity of nominating viable candidates. The majority party, on the other hand has less to gain by permitting its candidates to diverge from the preferences of the party, but it is less concerned with its ideological purity. The internal tension of majority parties, therefore, is the necessity for selecting among an abundance of viable candidates on the basis of some criterion other than ideology.

VI. FROM THEORY TO THE REAL WORLD

Our definition of party structure undoubtedly abstracts many interesting and important distinctions between minority and majority parties, as well as the pervasive conflicts within such organizations. This is, of course, a feature of all theories. Abstractness is not an evil nor can it be avoided in the development of any science. The relevant question is whether we have deduced an empirically valid and meaningful situation or whether we have provided only an insight into the logical equivalences of a mathematical structure which bears little relevance to actual campaigns. Political scientists should not be concerned *per se* with insights into a mathematical structure. They *should* be concerned with the relevance of such a structure to exceedingly complex processes. Hence, the correspondences between the real world and our model require identification, and it is these correspondences which should be considered.

FIG. 12

Arrow's General Impossibility Theorem is an example of the properties of an abstract analysis and its relation to the real world. In section 2 the paradox implied by this theorem is illustrated with a relatively simple situation consisting of three citizens, with unambiguously identified preference orderings over three alternatives, and a predetermined decision rule. One concludes from that illustration that the possibility of intransitive social preference is a pervasive feature of all collective decision-making situations. More importantly, Arrow's analysis consists of ascertaining the logical consequences of certain assumptions—*assumptions which do not begin to encompass the complexity of social processes*. We regard his General Impossibility Theorem as a relevant consideration in all such processes, though, because we believe that he abstracts from these processes certain fundamental characteristics. Our model, like Arrow's, should not be interpreted as a *description* of the electoral process, but as an *abstraction* of characteristics which seem fundamental and pervasive in electoral processes.

Despite such conditional statements, some scholars discount a model's value if its assumptions seem naive and unrealistic or if the opportunities for empirical analysis and further development are obscure. These conclusions about a model's assumptions, however, often are the result of two factors which, if recognized, can render the assumptions more palatable. First, there may be an unintentional resistance either to conceptualizing (perhaps diverse) empirical phenomena in terms of a model's parameters or to reinterpreting these parameters. Second, an assumption's suitability may be disputed because of a confusion between the properties of an adequate theory and the properties of a description of reality in terms of the theory.

As an example of the first factor, consider Downs's assumption that competition consists of parties presenting alternative ideological positions to the electorate. Obviously, a party is a complex and heterogeneous organization, and no single point on a scale is an adequate description of its campaign behavior. Thus, Downs abstracts from his analysis a pervasive and important feature of elections. If this assumption seems to be essential for spatial analysis, and if weakening it is a formidable task, we might reject spatial analysis. But if we represent reality as competition between candidates (individuals) and change Downs's label from "party" to "candidate" we increase somewhat the promise of his approach. A party can be interpreted then as a density of individual preferences which constrain the positions can-

didates adopt in the general elections.³⁵ Hence, a seemingly naive assumption becomes less objectionable by a simple reinterpretation of its content.

As a second example of the first factor, consider our multidimensional model. A common criticism of spatial analysis is that many citizens do not evaluate candidates on the basis of "issues", since voters' preferences are explained by partisan bias or the candidates' images. Some scholars conclude, therefore, that spatial models of competition are wholly inappropriate for understanding elections. Nevertheless, one can argue that partisan identification or candidate "image" can be conceptualized not simply as biases or new parameters but as additional preference dimensions (i.e., elements in each citizen's x vector). Thus, while additional measurement problems require consideration, we can at least reinterpret our data so that no new theoretical variables are required.

As a final example of the first factor, consider the observation that many citizens do more than simply vote in an election—many people contribute time and financial resources to one candidate or to the other. Much of a candidate's energies, moreover, are directed towards such citizens because their support is worth more than an equal number of citizens who contribute only their vote. Thus, spatial models might be construed to be inappropriate for understanding this vital aspect of elections. If we interpret voting as *only* one kind of political participation, however, and if we assume, by an appropriate redefinition of the terms in equation (7), that R is the utility a citizen derives from participating in some specified manner, we may interpret our results as the strategies candidates should adopt if they seek to maximize their plurality of any measure of participation. Thus, if we employ the assumption that variations in alternative forms of political participation can be explained by an equivalent calculus we can extend our analysis to the competition for these forms of support.

Reconceptualization also increases opportunities for testing the model. It may be difficult to measure adequately many parameters of a citizen's calculus in mass electorates; factors which we abstract out of the real world (e.g., uncertainty) may confound testability. Our sources of data, though, need not be confined to mass electorates. If we allow the

³⁵ See Peter H. Aranson and Peter C. Ordeshook, "Spatial Strategies for Sequential Elections," (forthcoming); and R. G. Niemi and H. T. Weisberg, *Probability Models in Political Science*

generalization concerning participation, for example, we can focus on citizens who might contribute money. And if the model supplies a satisfactory explanation for such people's actions then we have some confidence that the model is useful for discussing other forms of participation. Citizens comprising this restricted data base, furthermore, should have more information concerning the candidates' strategies, and their own preferences. Some of our ideal-type assumptions thereby are rendered more consonant with our view of reality.

Nevertheless, reconceptualization cannot account for other phenomena, such as the degree of uncertainty citizens associate with a candidate's strategy. Obviously, citizens associate some uncertainty with each element of θ_j , and candidates manipulate the stochastic properties of these elements as a strategic alternative to varying spatial location. Because we explicitly assume that θ_j is deterministic, we cannot consider such strategies presently. A fundamental variation in our assumption is necessary, then, if we wish to incorporate uncertainty into the analysis.

Reconceptualization, moreover, cannot diminish the difference in complexity between our theorems about elections and the real elections themselves. What is a candidate's optimal strategy, for example, when he and his opponent seek *both* votes and finances, when the subset of voter and financial contributors overlap, when the concerns of both subsets overlap, and when the candidates eventually hope to convert dollars into votes? If one assumes that competition occurs between candidates and not parties, as another example, what is the proper role of parties and party structures in a spatial model? Thus, even reconceptualization cannot now include many important elements of elections such as uncertainty, cognitive dissonance, misperception, and the strategies of varying uncertainty and issue saliency. Therefore, one must evaluate the adequacy of spatial models from the perspective of these omissions.

This evaluation entails clarification of a confusion which plagues political research, and which is the second factor accounting for the charge of naivete or unrealism of assumptions. Political scientists commonly confuse the desirable properties of a deductive theory with properties of an adequate description of reality in terms of such a theory.³⁶ Theory con-

struction consists of formulating general sentences about reality. The general sentences of one or more theories may be applied to particular classes of real world situations. Thus, science proposes no general "theory of falling feathers," for example, which attempts to predict every twist and turn of a feather's flight. One the other hand, one might attempt to fully explain and predict a feather's path if the environmental conditions are well specified, and if sufficient computer resources are available; and such an effort would undoubtedly utilize existing theory. Nevertheless, the fact that parsimonious propositions about falling feathers cannot be constructed is not interpreted as an inadequacy of Newtonian physics.

For identical reasons, political scientists should not expect theories from which we deduce directly all relevant or interesting aspects of reality. Instead we must differentiate between the process of constructing theories and that of applying them. This distinction necessarily entails differentiating between those facets of reality which we do not conceptualize as elements of our theory and those elements which are simple complex combinations of laws we understand theoretically.

Consider, for example, our assumption that all citizens weight the issues in an identical fashion (or our weaker assumption that these weights are distributed independently of preference). Obviously, this assumption is not satisfied generally. Hence, the critic might reject our analysis or demand that such an assumption be removed. If we remove it, however, no general sentences may be forthcoming—the situation appears to be entirely too unstructured for the construction of law-like generalizations, although our perception may or may not be correct. We can suggest, however, a strategy for empirical research about the positions which candidates are likely to adopt: (1) decompose the electorate into subgroups such that for each subgroup one reasonably might anticipate compliance with the independence assumption (e.g., Pool *et al*'s categories);³⁷ (2) assuming that, for each subgroup, preferences are distributed symmetrically and unimodally, ascertain the mean

use of the word *theory* see Carl G. Hempel, *Philosophy of Natural Science* (Englewood Cliffs: Prentice-Hall, 1966). See also, Otto A.

preference vector of each such group; (3) for each candidate, ascertain those subgroups he is unlikely or unwilling to satisfy under any circumstances; (4) for each candidate, ascertain those subgroups he is likely to satisfy under any circumstance, and; (5) for the remaining (i.e., pivotal) subgroups find some strategy vector which comes closest to the aggregate mean preferences of these groups. This latter step, admittedly, is ambiguous, and it suggests employing devices such as ascertaining an optimal strategy by trial and error in simulated campaigns.

A second example in which we might combine productively techniques of application such as simulation with abstract theoretical principles concerns the potential conflict between the policy preferences of activists and those of voters.³⁸ By activists, we mean those citizens who, in addition to their vote, contribute valuable resources, such as finances or a party's nomination, to a candidate. Candidates

must accord these citizens additional consideration when formulating strategies. Generally, however, the means of the preference densities of the activists and of the mass electorate do not coincide, so the candidate somehow must compromise his strategies. He might, for instance, attempt simply to assign a weight to each citizen's preference on the basis of the citizen's value, ascertain the mean preference of the weighted population, and adopt this mean. But such *ad hoc* procedures require additional justification. A citizen's value is likely to be a function of the particular resource he contributes, the amount he contributes, and the candidate's opportunities for utilizing this resource—all of which may be functions of the candidate's present strategy which, in turn, is a function of the citizen's value and the weight the candidate assigns him. Within such cyclical relationships we can suggest a few factors candidates must consider (and which we must consider when testing spatial models):

1. the resources various groups of activists can contribute,
2. the preference density of each group and of the mass electorate,
3. the patterns of issue saliency within each group and within the mass electorate,
4. the opportunities for converting each resource into votes.
5. the tradeoffs between resources necessitated by conflicting policy preferences.

This list illustrates only some of the complexity of electoral processes. A deductive approach may be suited to analyzing abstractly the opportunities for converting resources such as finances into resources such as votes and the tradeoffs between resource procurement necessitated by conflicting policy preferences.³⁹ Candidates, moreover, probably employ simplifying decision rules. But elections are far more complex than falling feathers, so political scientists must be cognizant of the distinction between the processes of constructing theories and those of applying them in particular instances. The important problem is determining what aspects of electoral behavior are amenable to parsimonious deductive examination and what aspects are not susceptible to the development of law-like propositions.

Definitive answers to such questions, of course, are difficult to ascertain, and the absence of adequate research about even a few of

³⁸ Some practitioners of simulation methods might object to our removing simulations from the class of deductive scientific theories. We agree with Hayward R. Alker's observation that the logical operations of computer simulations are deductive ("Computer Simulation, Conceptual Frameworks and Coalition Behavior," in S. Groennings, et. al. (eds.), *The Study of Coalition Behavior*, forthcoming). But Alker's assertion constitutes a serious confusion of the use of deduction as a method of science with the notion of a deductive theory. In the first usage a deduction is the process of inference from general statements to concrete instances. Thus, one infers that, if all α are β , then a particular α is a β . In the second usage, deduction is the process of inference from general sentence to general sentence. Thus, one infers that if all α are β and if all β are α , then α is equivalent to β . The first kind of deduction is used in fitting models to reality, and, where analysis is complex, is the proper function of simulations; the second constitutes finding necessary and sufficient relations (i.e., cause) and is the proper domain of abstract mathematics. See, for example, Kenneth Waltz, "Realities, Assumptions, and Simulations," in William D. Coplin (ed.), *Simulation in the Study of Politics* (Chicago: Markham, 1968), and Charles A. Powell's review of Coplin's book, this REVIEW, LXIII (September 1969), p. 937. Perhaps the most fruitful attempt at applying in concert simulation and the generalizations of game theory and coalition theory, and the one which comports with our understanding of the proper uses of simulation—is presented in Coplin's volume by Howard Rosenthal in "Voting and Coalition Models in Election Simulations."

³⁹ See Gerald Kramer, "A Decision-Theoretic Analysis of a Problem in Political Campaigning," in J. L. Bernd (ed.), *Mathematical Applications in Political Science II* (Dallas: Arnold Foundation, SMU Press, 1966).

the factors we illustrate lessens the value of speculation. Nevertheless, we propose to identify some areas in which a deductive approach (theory *qua* science) might best be applied and some in which a less deductive approach might be more suitable. First, it seems reasonable to suppose that uncertainty can be introduced into the model if we let either the citizens' preference vectors, x , or the candidates' strategy vectors, θ_1 and θ_2 , be random variables.⁴⁰ Thus, we might examine the strategy of varying the uncertainty associated with a candidate's position and thereby consider situations in which an incumbent's position is known (because his position is the policies he supports while in office) and his opponent's position is a matter for speculation. Similarly, we should be able to construct general propositions concerning the strategy of varying the relative saliencies of issues, and to contrast the efficacy of each strategy—varying uncertainty, saliency, and spatial location.

A citizen's cognitive processes, however, are undoubtedly less amenable to such aggregate analysis, and approaches similar to those which McPhee suggests may be more appropriate.⁴¹ We might incorporate the effects of cognitive dissonance in a deductive analysis, for example, by assuming that the candidates' strategies are restricted and that these restrictions are mathematical functions of issue saliency. As with our assumption concerning a common pattern of saliency, however, an analysis of cognitive dissonance and its effects in heterogeneous electorates may not be susceptible to the development of general law-like propositions.

The inherent limitations of theories also should be kept in mind when analyzing situations in which no dominant position exists. We

note previously that dominant positions do not exist for most preference densities—even for idealized situations. So we propose in section 4 a general bound on acceptable strategies for any density, and our analysis of symmetric densities suggests that strategies near or at the median are powerful attractions for candidates in less restricted circumstances. The strategies candidates really do adopt if no dominant position exists, however, are at present a function of factors which are not included in our model. It is reasonable to suppose that some of these factors, such as restrictions on spatial location and the candidates' reaction paths, can be incorporated rigorously into the model. Other factors, such as miscalculation, probably must remain external.

Obviously one can imagine many additional extensions and inherent limitations of our model. We offer these suggestions as an alternative to a banal call for further research and the observation that people develop theory slowly and incrementally. Instead, we identify some extensions which we are currently researching, and we offer some notes of caution to others who seek to develop deductive political theories. These notes of caution are relevant also to those who might attempt to test some of our conclusions or who might attempt naively to draw inferences from the model about reality. One cannot, for example, conclude that two candidates should converge whenever polls reveal that preferences are distributed unimodally. The underlying distribution of activists' preferences may be bimodal and the support of these activists may be essential. If this is the case, it would be unwise for either candidate to set his position equal to the median because to do so would be to alienate this support. Additional complications are easily imagined. Hence, those who would test and develop a theory—as well as those who would criticize it—must recognize the distinction between features of politics which are expressions of general theoretical propositions and those which are complex combinations of these propositions.

AN AXIOMATIC MODEL OF VOTING BODIES*

STEVEN J. BRAMS,

AND

MICHAEL K. O'LEARY,
Syracuse University

1. INTRODUCTION

The act of voting in legislative and judicial bodies is one of the most widespread and valuable sources of information available to political analysts. When individuals make structured choices within some known institutional constraints, there is opportunity for the generation of data concerning how issues are collectively defined within an institution, the relative position of each actor with regard to every other actor, and the identification of blocs of actors which are more or less persistent from one issue to another over time. With proper techniques of analysis, we should be able not only to generalize about behavior within a given voting body but also to make general statements about the voting process.

Cumulative studies of voting can be undertaken, however, only on the basis of some paradigm of the voting process—that is, some consensus on how voting as an act of political commitment is to be viewed.¹ Such a paradigm not only should provide a viewpoint for the study of voting but should also suggest an orientation to the more general political phenomenon of which voting is an example—that is, actors making mutually exclusive choices in

response to a series of questions, issues, candidates, etc. That such an agreed-upon viewpoint—not to mention a model that gives the viewpoint a precise focus—does not exist is obvious from the uses which have been made of voting data.² Despite the ubiquity of such data and the many different kinds of analyses that have been performed on them,³ there is no model available that logically interrelates (1) systemic characteristics of voting bodies, (2) individual characteristics of their members, and (3) relational characteristics between pairs of members in such a way as to yield operational measures of voting behavior that are comparative in nature. This lack of a model seems to us the basic reason why there are so many quantitative indicators of voting behavior and so few comparable results. More often than not, the indicators used by analysts are “interesting” measures that are unrelated to a set of explicit definitions and assumptions about voting behavior and therefore incapable of rigorous

* This is a revised version of a paper presented at the Conference on Mathematical Theory of Committees and Elections, Institute for Advanced Studies, Vienna, June 26–28, 1968; and at the Annual Meeting of the American Political Science Association, New York City, September 2–6, 1969. We wish to acknowledge the valuable research assistance offered on this paper by Alan D. Miller and the financial support of the National Science Foundation under Grant GS-2161.

¹ We use the term “paradigm” to indicate the generally accepted assumptions, concepts, and techniques used by members working in a particular field or on a particular problem, but not necessarily accepted by, or relevant to, all members of a discipline like political science. See Thomas Kuhn, *The Structure of Scientific Revolutions* (Chicago: University of Chicago Press, 1962), esp. pp. 49ff.

² We use the term “model” to mean both (1) an *arithmetical representation* of empirical phenomena, characterized by a set of tautological or logically true statements to which we shall co-ordinate descriptive concepts (e.g., Agreement Level, Variance Level, etc.), and (2) a *formalization* achieved by replacing descriptive concepts with symbols that facilitate the deduction of theorems. For an explication of these different meanings of the term “model,” see May Brodbeck, “Models, Meaning, and Theories,” in her *Readings in the Philosophy of the Social Sciences* (New York: Macmillan Company, 1968), esp. pp. 588–597.

³ For a useful survey of different methods that have been used to analyze roll-call data, see Lee F. Anderson, Meredith W. Watts, Jr., and Allen R. Wilcox, *Legislative Roll-Call Analysis* (Evanston, Ill.: Northwestern University Press, 1966). See also Duncan MacRae, Jr., *Issues and Parties in Legislative Voting: Methods of Statistical Analysis* (New York: Harper & Row, 1970) for a careful and systematic review of the statistical literature relevant to roll-call analysis.

comparison with indicators used by other analysts.

In this article we hope to do more than continue the proliferation of *ad hoc* indicators of voting behavior. What we shall propose is a probabilistic model which can be applied to voting data in order to develop a set of *a posteriori* probabilities⁴ that two randomly-selected members of a voting body agree on zero or more roll calls. These probabilities will allow us to calculate the expected number of roll calls on which two randomly-selected members agree, which is the basic measure we shall use to define operationally a set of empirical indicators of (1) agreement and variance in voting for the body as a whole, and (2) relative agreement between pairs of members. Additionally, we shall define a somewhat independent probabilistic indicator for individual members that measures the extent to which a member supports the position of the majority, or other specified members, of the body.

These indicators are all comparative in the sense of being applicable to voting bodies of any size whose members take any number of different positions on a roll-call vote. Although we shall develop our indicators in terms of three different kinds of votes ("yes," "no," and "abstain"), they can easily be extended to any number of options which seem appropriate

⁴ As distinguished from *a priori* probabilities based strictly on the outcomes of a conceptual experiment. Although we shall present in the beginning an abstract model of the outcomes of a voting experiment, we wish to differentiate this kind of model, whose probabilities depend on the actual voting of members of a body, from models in which the probabilities arise from the institutional prerogatives of the members (i.e., the "voting rules" of the system). For an example of the latter kind of model, see L. S. Shapley and Martin Shubik, "A Method for Evaluating the Distribution of Power in a Committee System," this REVIEW, XLIII (1954), 787-792; for an example of the kind of model used in this article that is based on the distribution of different kinds of votes, see William H. Riker, "A Method for Determining the Significance of Roll Calls in Voting Bodies," in John C. Wahlke and Heinz Eulau (eds.), *Legislative Behavior: A Reader in Research and Theory* (Glencoe, Ill.: Free Press of Glencoe, 1959), pp. 377-384. It should be noted that the distinction we draw between *a priori* and *a posteriori* probabilities is quite different from that made in applications of Bayes' theorem. Cf. Peter W. Zehna, *Finite Probability* (Boston: Allyn and Bacon, Inc., 1969), pp. 47-50.

under a particular voting procedure.⁵ Previous studies have been bedeviled with the problem of how to deal with more than two voting options, and all techniques so far suggested have been in our view unnecessarily arbitrary.

To begin our analysis, we shall develop a mathematical model, based on probability theory⁶ and using some calculus, that conceptualizes voting as a mapping of a set of members of a voting body into a set of voting options. From this abstract representation of the voting process, we can determine the numbers of members who voted in particular ways, which will serve as the basic parameters of the model.

The next step in the process of formalizing our model is to relate these parameters, or certain quantities based on the parameters, to each other through a set of assumptions (or axioms). The purpose of this *axiomatization* is to provide a starting point, in the form of an economical and self-contained set of elements and relations, from which we can efficiently generate a rich array of theorems that lay bare the concepts we define and logical connections among them. Defining concepts and proving theorems that help us to simplify and interrelate the concepts, and discover implications of the axioms, is the final step in the *mathematization* of the model, the product of which is a *deductive system* tied directly to reality only through its parameters and axioms. It is the concepts derived from the parameters and the theorems deduced from the axioms in the system, however, that are of greatest interest to us: the concepts provide us with our different measures of voting behavior, and the theorems help us to explicate their underlying logic, with the proofs providing a check on the correctness of our reasoning. In the absence of the logical structure that the system provides, one can easily run amok on a set of ambiguous concepts and inconsistent propositions, which are some

⁵ We have chosen to develop our model in terms of three kinds of votes instead of two since abstention is a frequently chosen voting option in some bodies (e.g., UN General Assembly, whose roll calls for several sessions we are now analyzing using the indicators of the model).

⁶ An excellent reference is William Feller, *An Introduction to Probability Theory and Its Applications*, Vol. I (3d ed. rev.; New York: John Wiley and Sons, Inc., 1968); at a less advanced level, see John G. Kemeny, J. Laurie Snell, and Gerald L. Thompson, *Introduction to Finite Mathematics* (Englewood Cliffs, N. J.: Prentice-Hall, Inc., 1966), chpts. 3 and 4.

of the difficulties that have beset other studies of voting bodies.

The antecedent of the mathematical model is the mathematical theory on which it is based, the parameters of the model being an *interpretation* of the primitive, or undefined, terms in the theory. We have endeavored to provide not only the primitive terms with an interpretation in the context of voting bodies but the axioms, derived concepts, and proved theorems as well. Also, we have sought to give the model a concrete *operational* meaning by showing how the various measures developed in the model can be computed for a hypothetical voting body.

Because the approach we have taken to model-building is still unorthodox in political science⁷ (though its usefulness has recently been debated⁸), and because we do not want our purposes misunderstood, two points need to be stressed at the outset. First, our model, like verbal models, is an abstraction, or idealization, of reality that may or may not be regarded as fruitful in the building of empirical theory. Because it is *not* such theory, it is neither correct nor incorrect, true or false. Rather, through its assumptions the model provides a representation of the behavior of members of a voting body, just as a plane in Euclidean geometry may be used to represent

any real portion of the earth's surface.⁹ We can only hope at this stage that the model will give some logical coherence to the study of voting bodies and that some of the major concepts developed in the model may prove useful in the testing of hypotheses about the voting process. Toward realizing the latter aim, we shall give some examples later in the paper of testable hypotheses that incorporate concepts from the model, buttressed by some preliminary empirical results on the application of the model to both voting bodies (U.S. House of Representatives, national party conventions) and nonvoting data (wartime alliances in nineteenth and early twentieth centuries).

Second, in our effort to make the exposition of the formal model as intelligible as possible, we have steered away from a heavy use of symbolism and strayed somewhat from a strict adherence to the stern canons of mathematical rigor and logical proof. We have, for example, tried to show that the parameters and axioms in our axiomatization are reasonable and useful (in general, there is more than one way to axiomatize a model), if not always "realistic," but not that they constitute an irreducible set (i.e., are logically independent). In fact, we have not even tried to enumerate all the definitions and assumptions of probability theory underpinning our axiomatization, but the mathematically inclined reader can easily fill in the gaps. We have not generalized our theorems to a voting body with more than three voting options, though in most cases the extensions are obvious. In the interest of economy, we have assumed without proof the properties of such well-known statistical measures as the mathematical expectation and variance and, in addition, have not included in this article the fairly long proofs of two theorems, though we will be glad to make these proofs available to anyone interested in them on request. Furthermore, so as not to clutter up the paper with innumerable, separately-stated "definitions," we have defined minor concepts which facilitate further description of aspects of a voting body in the statement of theorems. Thus, in building a model that might appropriately be regarded as "semi-formal," we have ignored some of the strictures of the axiomatic method and instead tried to highlight the intuitive rationale of the

⁷ Pioneering works by economists, relevant to political science, that employ the axiomatic approach include Kenneth J. Arrow, *Social Choice and Individual Values* (New York: John Wiley & Sons, Inc., 1951); Anthony Downs, *An Economic Theory of Democracy* (New York: Harper and Brothers, 1957); Duncan Black, *The Theory of Committees and Elections* (Cambridge, Eng.: Cambridge University Press, 1958); and James Buchanan and Gordon Tullock, *The Calculus of Consent: Logical Foundations of Constitutional Democracy* (Ann Arbor, Michigan: University of Michigan Press, 1962). Major works by political scientists using this general approach, though with rather different specific emphases, are Robert A. Dahl, *A Preface to Democratic Theory* (Chicago: University of Chicago Press, 1956); Morton Kaplan, *System and Process in International Politics* (New York: John Wiley & Sons, Inc., 1957); and William H. Riker, *The Theory of Political Coalitions* (New Haven, Conn.: Yale University Press, 1962).

⁹ For a brief history of the axiomatization of geometry, see Herbert Hochberg, "Axiomatic Systems, Formalization, and Scientific Theories," in Llewellyn Gross (ed.), *Symposium on Sociological Theory* (New York: Harper & Row, 1959), pp. 419-422.

FIGURE 1
MAPPING OF MEMBERS INTO VOTING OPTIONS

Fig. 1

formalization and illustrate with concrete examples the utility of the concepts developed in the model.

II. SOME FORMAL CHARACTERISTICS OF THE MODEL

Preliminaries. We start with the notion of a set, or voting body, containing a finite number of members. "Voting body" is a primitive term to which we can add the relational concept of a "vote on a roll call" as a mapping of members of a voting body into (but not necessarily onto) a "set of voting options" containing, for example, the members "yes," "no," and "abstain." The idea of a *mapping*, which relates the members of two different sets to each other in a particular way, is a fundamental one in mathematics, but for our purposes it is only necessary to consider the results of the mapping (voting process). That is, on each roll-call vote the usual many-to-one correspondence established between the *domain*, or set of members of the voting body, and the *range*, or set of different voting options, partitions the domain into *preimages*, or subsets whose members voted in a particular way. Conversely, the mapping associates with each preimage a unique *image* (voting option), as shown in Figure 1.

Given three kinds of voting options in a voting body—"yes," "no," and "abstain"—the parameters (or variables) of the model for each roll-call vote are the numbers of members in each of the preimages:

y =numbers of members who vote "yes" on the roll call,

n =numbers of members who vote "no" on the roll call,

a =number of members who vote "abstain" on the roll call.

The total number of members present and

voting on each roll call is

$$t = y + n + a.$$

Interrelating these parameters through the axioms of our model will be the means by which we impose a *logical structure* on the voting of members in a voting body.

Definition 1. The probability that two *randomly-selected* members i and j agree on a roll call, $P(AG_{ij})$, is equal to the probability that both vote "yes," $P(Y_i, Y_j)$, both vote "no," $P(N_i, N_j)$, or both "abstain," $P(A_i, A_j)$:

$$P(AG_{ij}) = P(Y_i, Y_j) + P(N_i, N_j) + P(A_i, A_j). \quad (1)$$

Since the values of each of the three terms on the right-hand side of equation (1) are

$$P(Y_i, Y_j) = \frac{\binom{y}{2}}{\binom{t}{2}} = \frac{y!}{2!(y-2)!} \cdot \frac{2!(t-2)!}{t!} \\ = \frac{y(y-1)}{t(t-1)},$$

$$P(N_i, N_j) = \frac{\binom{n}{2}}{\binom{t}{2}} = \frac{n!}{2!(n-2)!} \cdot \frac{2!(t-2)!}{t!} \\ = \frac{n(n-1)}{t(t-1)},$$

$$P(A_i, A_j) = \frac{\binom{a}{2}}{\binom{t}{2}} = \frac{a!}{2!(a-2)!} \cdot \frac{2!(t-2)!}{t!} \\ = \frac{a(a-1)}{t(t-1)},$$

where $\binom{m}{n}$ denotes the number of combinations that can be formed from m objects taken

n at a time, or $m!/n!(m-n)!$, equation (1) can also be written as¹⁰

$$P(AG_{ij}) = \frac{y(y-1) + n(n-1) + a(a-1)}{t(t-1)}.$$

Concretely, this measure may be interpreted as the ratio of the number of ways of choosing two members who voted the same way (without replacement of the first member before selection of the second) to the number of ways of choosing two members of the entire body (again without replacement). It is easy to show that $0 \leq P(AG_{ij}) \leq 1$.

Axiom 1. If $P(DG_{ij})$ is equal to the probability that two randomly-selected members i and j disagree on a roll call,

$$P(AG_{ij}) + P(DG_{ij}) = 1.$$

That is, it is a certainty that two randomly-selected members present and voting will either agree or disagree on a roll-call vote. More formally, we assume that the events "agree" and "disagree" are not only mutually exclusive (if one event occurs for a pair, then the other cannot) but exhaustive (no other event can occur).

Definition 2. $P(DG_{ij}) = 1 - P(AG_{ij})$.

The above follows immediately from Axiom 1 (i.e., $P(DG_{ij})$ is implicitly defined by Axiom 1). Alternatively, we can calculate $P(DG_{ij})$ from the formula,

$$P(DG_{ij}) = P(Y_{ij}, N_{ji}) + P(Y_{ij}, A_{ji}) + P(N_{ij}, A_{ji}), \quad (2)$$

where $P(Y_{ij}, N_{ji})$, for example, is equal to the probability that i votes "yes" and j votes "no" or j votes "yes" and i votes "no" (i.e., one member votes "yes" and the other votes "no," but it does not matter which one). In this case,

$$P(Y_{ij}, N_{ji}) = \frac{\binom{y}{1} \binom{n}{1}}{\binom{t}{2}} = \frac{y!n!}{(y-1)!(n-1)!}.$$

¹⁰ Similar calculations could be made for the probability that blocs of three or more members agree on a particular roll call. For example, the probability that three randomly-selected members— p , q , and r —agree on a particular roll call is

$$P(AG_{pqr}) = \frac{y(y-1)(y-2) + n(n-1)(n-2) + a(a-1)(a-2)}{t(t-1)(t-2)}.$$

For a discussion of the probability of bloc voting under varying assumptions, see Arend Lijphart, "The Analysis of Bloc Voting in the General Assembly: A Critique and a Proposal," this REVIEW, LVII (Dec. 1963), 906-908.

$$\frac{t!(t-2)!}{2!} = \frac{2yn}{t(t-1)},$$

and, after analogous calculations for the other two terms on the right-hand side of equation (2), we get¹¹

¹¹ The probability of paired disagreements based on the party affiliations of members rather than their actual votes on roll calls, is what Douglas W. Rae calls the "fractionalization" of seat shares in a parliamentary body. His probability calculations are valid, however, only for a body that approaches infinite size in which, having chosen one member of the body, the probability of choosing another member of the same (or a different) party is unaltered by the fact that there is one less member of the body (and the party, if it were that made on the previous choice) from which the second choice can be made. Since we are dealing with bodies of finite size, Rae's assumption of sampling with replacement is untenable and we must instead assume sampling without replacement in calculating these probabilities. Fortunately, the practical difference between these two assumptions is small except when the fractionalization index is applied to small voting bodies, so most of Rae's empirical results on fractionalization probably remain unaffected by his erroneous calculations. See *The Political Consequences of Electoral Laws* (New Haven, Conn.: Yale University Press, 1967), pp. 62ff. We shall see later that the size of a voting body will affect the probability that two randomly-selected members agree (or disagree), which Rae did recognize in a subsequent article, "A Note on the Fractionalization of Some European Party Systems," *Comparative Political Studies*, I (Oct. 1968), 413-418. For a generalization of the fractionalization index to the study of political cleavages, see Michael Taylor and Douglas Rae, "An Analysis of Crosscutting between Political Cleavages," *Comparative Politics*, 1 (July 1969), 534-547; and Rae and Taylor, *On Political Cleavages*, forthcoming. An ingenious index, A_{ij} , developed by Duncan MacRae, Jr., for measuring agreement between two specific members of a voting body, has a probabilistic interpretation for bodies that approach infinite size in which two voting options are allowed: when two members agree, A_{ij} is equal to the probability of two randomly-selected members' taking the contrary position; when two members disagree, A_{ij} is equal to one-half the negative value of the probability of two randomly-selected members' taking different positions. These curious values have substantive implications which, as S. Sidney Ulmer has shown, are not justified by any explicit theoretical framework. See Duncan MacRae, Jr., "Indices of Pairwise Agreement Between Justices or Legislators,"

$$P(DG_{ij}) = \frac{2(yn + ya + na)}{l(l-1)},$$

where $0 \leq P(DG_{ij}) \leq 1$.

Axiom 2. The probability of agreement of two randomly-selected members on a roll call(s) is statistically independent of the probability of agreement on any other roll call(s). More formally, the number of agreements of two randomly-selected members on each roll call (0 or 1) are mutually independent random variables.¹²

This is a somewhat controversial axiom and deserves clarification. For the case when one member agrees to support another member in exchange for that member's vote at another time, it is evident that Axiom 2 is violated because the probability of agreement of the pair on one roll call is completely determined by their probability of agreement on the other roll call. It is doubtful, however, that of all possible pairs of members in a legislative or judicial body, the voting of a significant fraction of them is governed by pairwise pledges of support on most roll calls.

Variables exogenous to the model, like party membership, may upset the independence axiom in a more serious way. In the extreme case of a legislature whose parties exercise complete discipline over the voting of their members, membership in a party is tantamount to pairwise pledges to vote with each other member of the party on all roll calls, which clearly violates Axiom 2. In fact, any forces impinging on the members of a legislature that induce a subset of members to vote consistently the same way (e.g., because they are from the same geographic region) introduces a steady bias in voting that does violence to Axiom 2. Thus, though a particular vote on one roll call does not *logically* imply a particular vote on another roll call, two voters may decide to vote together because of reciprocal pledges to each other or blanket pledges to party, region, etc.

Midwest Journal of Political Science, X (Feb., 1966), 138-141; and S. Sidney Ulmer, "Pairwise Association of Judges and Legislators: Further Reflections," *Midwest Journal of Political Science*, XI (Feb. 1967), 106-115. The inattention of analysts to the theoretical justification of quantitative indices underscores our previous argument of the need for deriving indices from models with clearly-articulated assumptions about the voting process.

¹² Cf. the "axiom of local independence" in Paul F. Lazarsfeld and Neil W. Henry, *Latent Structure Analysis* (Boston: Houghton Mifflin Company, 1968), p. 22.

To the extent that a member's affiliations are cross-cutting (e.g., Republican party, urban black constituency), his commitment to any particular subset of members will tend to be eroded and blanket pledges of support will less certainly be translated into pairwise pledges. In fact, it seems reasonable to assume that the greater the number of cross-cutting affiliations of members of a legislature, the lower the probability that they will vote consistently with any one subset of members and, therefore, the more applicable Axiom 2 will be to the body.

Even in the extreme case where a steady voting bias prevails (e.g., because of strict party discipline) that is incompatible with Axiom 2, this does not make the definitions and theorems flowing from this axiom irrelevant or useless. In fact, the probabilities we shall give below in Theorems 1 and 1a may be strictly mythical in the sense that they do not reflect the voting of *any* pair of members. For example, if members vote strictly along party lines in a legislature containing two parties always at odds with each other, each member will agree with every other member with either probability 0 or 1 across a set of roll calls—and not some intermediate value which our calculation below will produce.¹³

The probabilities we shall give below apply to bodies whose pairs of members vote *as if* their probabilities of agreement were statistically independent across successive roll calls. What this involves is translating the deterministic fact that every voter unmistakably agreed or disagreed with all other voters on each roll call into a probabilistic statement for a hypothetical "average" pair.¹⁴ Thus, what we are really conjuring up in this conceptual experiment are two mythical voters whose probability of agreement reflects the amount of agreement between a "typical" pair of members of the body. The behavior of actual voters will be compatible with Axiom 2 to the degree

¹³ What we have specified are, in effect, the "limiting conditions" on the veracity of this axiom. See Herbert A. Simon, "On Judging the Plausibility of Theories," in B. van Rootselaar and J. F. Staal (eds.), *Logic, Methodology, and Philosophy of Sciences III* (Amsterdam: North Holland Publishing Company, 1968), pp. 442ff.

¹⁴ For examples in mathematics and physics where "the determinateness of the simple single event and the probabilistic theory of the highly composite whole may seem to be equally compatible . . .," see G. Polya, *Patterns of Plausible Inference* (2d ed.; Princeton, N. J.: Princeton University Press, 1968), p. 194, fn. 3.

that their voting corresponds to that of the fictitious "typical" pair.

While this "typical" pair may not exist, it is precisely this kind of construct we are searching for in order to say something about how members of a body behave "on the average," just as the actuary is interested in describing the "typical" individual's chances of surviving "on the average." As Feller put it, "Practical and useful probability models may refer to non-observable worlds,"¹⁵ which sometimes can only be built on a structure of "unrealistic" assumptions (in the mortality tables of the actuary, everyone is dead at age 100). Milton Friedman described the role assumptions play in theory-building as follows:

Truly important and significant hypotheses will be found to have 'assumptions' that are wildly inaccurate descriptive representations of reality, and, in general, the more significant the theory, the more unrealistic the assumptions. . . . The reason is simple. A hypothesis is important if it 'explains' much by little, that is, if it abstracts the common and crucial elements from the mass of complex and detailed circumstances surrounding the phenomena to be explained. . . . Its very success shows them to be irrelevant for the phenomena to be explained.¹⁶

The natural sciences have been built on a set of idealized situations (e.g., ideal gases, rigid rods, frictionless surfaces, perfect vacuums, and instantaneous velocities are all idealizations of physical states and objects) and "as if" assumptions, sometimes highly unrealistic, from which have been generated a set of nonobvious consequences possessing great explanatory power. To illustrate, Galileo's law of the inclined plane—that the distance traveled by a ball rolling down the plane increases with the square of time—

. . . does ignore variables that may be important under various circumstances: irregularities in the plane or the ball, rolling friction, air resistance, possible electrical or magnetic fields if the ball is metal, variations in the gravitational field—and so on, ad infinitum. The enormous progress that physics has made in three centuries may be partly attributed to its willingness to ignore for

a time discrepancies from theories that are in some sense substantially correct.¹⁷

Thus, assumptions (or axioms) are useful only because they are radical simplifications of the world.¹⁸ What is at issue here is not the verisimilitude of our axioms but (1) whether concepts can be derived from the axioms that are descriptive of important aspects of voting bodies, and (2) whether nonobvious consequences linking these concepts, which are amenable to empirical validation, can be deduced from the axioms of the model. We shall return later to these considerations, as they apply to the model, but for now the adoption of Axiom 2 enables us to calculate the probability of agreement between two randomly-selected

members i and j across a set of roll calls a —simply the product of the (unconditional) probabilities of agreement on each roll call.

Theorem 1. The probability that two randomly-selected members i and j , present and voting¹⁹ on m roll calls, agree all the time—or m out of m roll calls—is

$$P(AG_{ij})^{m,m} = P(AG_{ij})^1 P(AG_{ij})^2 \cdots P(AG_{ij})^m,$$

where the superscripted factors on the right-hand side of the equation indicate the probabilities of agreement of members i and j on all roll calls 1, 2, . . . , m , based on the actual number of "yes," "no," and "abstain" vote on each roll call.

Proof. Immediate consequence of Axiom 2.

Theorem 1a. This is a generalization of Theorem 1. The probability that two randomly-selected members i and j , present and voting on m roll calls,²⁰ agree on *exactly* k out of

¹⁷ Yuji Iriji and Herbert A. Simon, "Business Firm Growth and Size," *American Economic Review*, LIV (March, 1964), 78. Italics in original. We owe this citation to Bruce M. Russett, "Is There a Long-Run Trend Toward Concentration in the International System?" in Russett (ed.), *Economic Theories of International Politics* (Chicago: Markham Publishing Company, 1968), p. 312.

¹⁹ Later we shall consider various ways to include absentees in the analysis.

²⁰ For the special case in which the voting members of a body are the same across all roll calls, the probability that *at least one* of the $p = t(t-1)/2$ pairs of members agrees on all roll calls is

¹⁵ Feller, *op. cit.*, p. 3. Italics in original.

¹⁶ Milton Friedman, *Essays in Positive Economics* (Chicago: University of Chicago Press, 1953), pp. 40–41. For a critique of this viewpoint, see Tjalling C. Koopmans, "The Construction of Economic Knowledge," in May Brodbeck (ed.), *Readings in the Philosophy of the Social Sciences*, *op. cit.*, esp. pp. 534–538.

the m roll calls ($k \leq m$) is

$$P(AG_{ij})^{m,k} = \sum_{\binom{m}{k}} [P(AG_{ij})^1 \cdots P(AG_{ij})^k P(DG_{ij})^{(k+1)} \cdots P(DG_{ij})^m].$$

Proof. Immediate consequence of Axiom 2.

The summation on the right-hand side of the above equation ranges over all combinations of m roll calls, $\binom{m}{k}$, on k of which members i and j agree and on $(m-k)$ of which members i and j disagree. The superscripts do not indicate particular roll calls but only the fact that in each term of the summation there must be k distinct roll calls on which members i and j agree and $(m-k)$ on which members i and j disagree. Since i and j may refer to any two randomly-selected members of the voting body, we can drop these subscripts and write the joint density (or mass) function of the probability distribution across m roll calls as follows:

$$f(m, k) = P(AG)^{m,k}$$

The key summation process of the model is embodied in the above theorems, which allow us to make probabilistic statements about agreement between members on more than one roll call. To calculate the probability, for example, that two randomly-selected members agree on two out of five roll calls, the summation on the right-hand side of the above equation would include $\binom{5}{2}=10$ terms. Each of these terms would contain two factors equal to the probability of agreement on two specific roll calls (e.g., roll calls 1 and 2)—the two roll calls being different for each of the ten terms—and three factors equal to the probability of disagreement on the remaining three roll calls (e.g., roll calls 3, 4, and 5).

Definition 3. The probability that two randomly-selected members agree on *at most* k out of m roll calls (i.e., agree on 0 or 1 or . . . k roll calls) is the distribution function,

$$P(AG_{p \geq 1}) = 1 - [1 - P(AG_{ij})^{m,m}]^p,$$

since $[1 - P(AG_{ij})^{m,m}]$ is the probability that a randomly-selected pair of members disagrees on at least one roll call and $[1 - P(AG_{ij})^{m,m}]^p$ is the probability that all pairs of members disagree on at least one roll call. Furthermore, the number of pairs, p , such that the probability is $P(AG_{p \geq 1})$ that at least one of the pairs agrees on all roll calls is

$$p = \frac{\log [1 - P(AG_{p \geq 1})]}{\log [1 - P(AG_{ij})^{m,m}]},$$

since

$$[1 - P(AG_{p \geq 1})] = [1 - P(AG_{ij})^{m,m}]^p.$$

$$F(m, k) = \sum_{x=0}^k f(m, x) = \sum_{x=0}^k P(AG)^{m,x},$$

or the sum of the density function's images for all points $x=0, 1, \dots k$.

Definition 4. The probability that two randomly-selected members agree on *at least* k out of m roll calls (i.e., agree on k or $(k+1)$ or . . . m roll calls) is

$$G(m, k) = \sum_{x=k}^m f(m, x) = \sum_{x=k}^m P(AG)^{m,x}.$$

Definition 5. The expected (or average) number of roll calls on which two randomly-selected members present and voting on m roll calls agree is

$$E(AG) = \sum_{x=0}^m x f(m, x) = \sum_{x=0}^m x P(AG)^{m,x}.$$

Theorem 2. The expected number of agreements for each roll call i is equal to the probability of agreement on each roll call i , i.e.,

$$E(AG)_i = P(AG)_i.$$

Proof. For any single roll call i , $m=1$ in Definition 5. Thus,

$$\begin{aligned} E(AG)_i &= \sum_{x=0}^1 x P(AG)_i^{1,x} \\ &= (0)P(AG)_i^{1,0} + (1)P(AG)_i^{1,1} \\ &= P(AG)_i^{1,1} \\ &= P(AG)_i \quad \text{from Theorem 1 or 1a.} \end{aligned}$$

Theorem 3. The expected number of roll calls on which two randomly-selected members present and voting on m roll calls agree is equal to the sum of the probabilities of agreement on each of the m roll calls, i.e.,

$$E(AG) = \sum_{i=1}^m E(AG)_i = \sum_{i=1}^m P(AG)_i.$$

Proof. A well-known property of the mathematical expectation is that the expectation of the sum of a set of a random variables (whose values x on each roll call, given in the proof of Theorem 2, are equal to the number of agreements—0 or 1—for each pair) is equal to the sum of their expectations.²¹ Since the expected number of agreements on each roll call i is equal to the probability of agreement on each roll call i from Theorem 2, it follows that the expected number of agreements across a set of m roll

²¹ This is true even if the random variables are not mutually independent, as assumed in Axiom 2. While this axiom is not necessary to the proof of Theorem 3, we shall see later that it will prove necessary to the proof of Theorem 8 in the summation of variance across roll calls.

calls, given in Definition 5, can be expressed more simply as the sum of the probabilities of agreement on each of the m roll calls.

We shall now postpone a further elaboration of the formal model in order to illustrate some of the concepts which have so far been defined and develop heuristically the rationale for some later theorems which incorporate these concepts. We shall then present further formal aspects of the model, attempting throughout, however, to interpret the theoretical consequences flowing from the model with more understandable intuitive justifications and appropriate examples.

III. AN ILLUSTRATIVE APPLICATION TO VOTING DATA

To show how the probabilities can be calculated from voting data, consider a voting body of five members whose votes on five roll calls are given in Table 1. The probabilities that two randomly-selected members agree, $P(AG)_i$, and disagree, $P(DG)_i$, are shown for each roll call i . Note that the probability of agreement is at a maximum when all members vote the same way (roll call 5) and at a minimum when the three kinds of votes are split 1-2-2 (roll call 2).

For all five roll calls, the probabilities, $f(5,k)$, that two randomly-selected members agree on zero through five roll calls are given in Table 2, along with the cumulative probabilities, $F(5,k)$ and $G(5,k)$, that two randomly-selected members agree on at most, or at least, zero through five roll calls. Graphs of the density and distribution functions are shown in Figure 2, with smooth curves drawn through the points given in Table 2. It can be seen that the votes of no two members agree on zero roll calls (i.e., disagree on all five roll calls), so the corresponding probability, $f(5,0)$, is necessarily equal to zero. The probability that two randomly-selected members agree on two or fewer

TABLE 1.—PROBABILITIES OF AGREEMENT AND
DISAGREEMENT ON EACH ROLL CALL IN A
HYPOTHETICAL VOTING BODY

Roll Call	Votes of Members					Probability of Agree- ment and Disagree- ment of Two Randomly- Selected Members on Each Roll Call i	
	1	2	3	4	5	$P(AG)_i$	$P(DG)_i$
$i=1$	Y	Y	N	Y	A	.3	.7
$i=2$	N	N	Y	A	A	.2	.8
$i=3$	Y	Y	Y	Y	A	.6	.4
$i=4$	N	N	Y	N	A	.3	.7
$i=5$	Y	Y	Y	Y	Y	1.0	0.0

TABLE 2.—PROBABILITIES OF AGREEMENT ON
FIVE ROLL CALLS IN HYPOTHETICAL
VOTING BODY

Number of Roll Calls	Probabilities That Two Randomly-Selected Members Agree on		
	k $f(5, k)$	At most k $F(5, k)$	At least k $G(5, k)$
$k=0$	0.00	0.00	1.00
$k=1$.16	.16	1.00
$k=2$.41	.57	.84
$k=3$.32	.89	.43
$k=4$.10	.99	.11
$k=5$.01	1.00	.01

roll calls is greater than one half ($F(5,2) = .57$), but the probability that two randomly-selected members agree on all five roll calls is very small ($f(5,5) = .01$). In fact, in the latter case a glance back at Table 1 will show that the votes of only members 1 and 2 coincide perfectly on all five roll calls.

What do these *a posteriori* probabilities tell us? First, they provide convenient summary indicators of agreement on roll calls that may be very helpful in measuring changes in the amount of agreement among members of a voting body over time. Not only are they useful for looking at the amount of agreement in a voting body as a whole, but they can also be applied to subsets of members (e.g., the members of a political party) to measure agreement within these subsets. For example, from Definition 5 the expected number of roll calls on which members 1 and 2 agree is

$$\begin{aligned} E(AG) &= 0f(5, 0) + 1f(5, 1) + 2f(5, 2) \\ &\quad + 3f(5, 3) + 4f(5, 4) + 5f(5, 5) \\ &= 0 + 0 + 0 + 0 + 0 + 5(1.00) = 5.00, \end{aligned}$$

where the probability values for the first five terms on the right-hand side of the equation are all equal to zero. For members 3, 4, and 5, on the other hand, the expected number of agreements of two randomly-selected members is

$$\begin{aligned} E(AG) &= 0(0) + 1(.45) + 2(.44) + 3(.11) \\ &\quad + 4(0) + 5(0) = 1.67. \end{aligned}$$

For all five members of the voting body,

$$\begin{aligned} E(AG) &= 0(0) + 1(.16) + 2(.41) + 3(.32) \\ &\quad + 4(.10) + 5(.01) = 2.40. \end{aligned}$$

Alternatively, from Theorem 3 we could have summed the probabilities of agreement on each roll call to obtain the above values of $E(AG)$ for the body as a whole and the subsets. Note that

DENSITY AND DISTRIBUTION FUNCTIONS FOR
HYPOTHETICAL VOTING BODY

Fig. 2

these are not necessarily values that we expect to observe, since we would never observe 1.67 or 2.40 agreements between a pair across a set of roll calls, but rather the over-all average number of agreements per pair in the subset or the body.

Thus, while members 1 and 2 can be expected to agree on 100 percent (five out of five) of the roll calls, two randomly-selected members of the subset comprising members 3, 4, and 5 can be expected to agree on 33 percent of the five roll calls and two randomly-selected members of the entire five-member body can be expected to agree on 48 percent of the five roll calls. The amount of agreement would therefore appear to be least in the subset containing members 3, 4, and 5.

Having made these calculations for subsets of different size, it might appear that we could compare the amount of agreement not only in such subsets but in voting bodies of different size as well. A quick calculation will show, however, that for a given distribution of yeas, nays, and abstentions in a voting body (say, in the proportion 3:2:1), the probability of agreement between two randomly-selected members on a roll call will be greater when there are more members (say, 60) so divided (30-20-10) than when there are fewer members (say, 6) so divided (3-2-1). In the latter case, the probability that two randomly-selected members agree is

$$P(AG) = \frac{3(2) + 2(1) + 1(0)}{6(5)} = .27,$$

while the probability in the former case is

$$P(AG) = \frac{30(29) + 20(19) + 10(9)}{60(59)} = .38.$$

We may formalize this result as

Theorem 4. As the size of a voting body, t , becomes larger and larger (with a constant distribution of votes),²² the probability that two randomly-selected members agree on roll call i approaches the limit,

$$\lim_{t \rightarrow \infty} P(AG)_i = \frac{y^2 + n^2 + a^2}{t^2},$$

which in the case of the above distribution will be equal to

$$\frac{3^2 + 2^2 + 1^2}{6^2} = \frac{14}{36} = \frac{7}{18} = .39.$$

Proof. This involves proving that the function, $P(AG)_i$, for the limit postulated above, satisfies the definition of the limit of a function as $t \rightarrow \infty$. This proof is completely straightforward, though somewhat tedious, and will not be presented here.

IV. MEASURING AGREEMENT IN VOTING

Why is the probability of agreement between two randomly-selected members of large bodies necessarily greater than for small bodies? The reason for this surprising finding is that in larger bodies there are proportionally fewer pairs of members who can disagree. For a voting body consisting of only three members in which three kinds of votes are allowed, it is possible for all the members always to disagree on a roll call if one votes "yes," one "no," and one "abstain." If there are four members of a voting body, however, the votes of at least one pair of members must agree; and as the number of voting members increases, so does the *minimum number* of pairs that must agree. The *minimum proportion* of pairs that must agree, when the body is split as equally as possible among the different kinds of votes, is a non-decreasing (but not always increasing) function of the size of a voting body, as we see from the following theorem.

Theorem 5. In a body where the votes remain as equally divided as possible among the "yes," "no," and "abstain" positions, the proportion of agreeing pairs in the body will in-

²² If the distribution of votes does not remain constant and only some kinds of votes (say "yes" votes) tend toward infinity as the body becomes larger and larger, then $P(AG)$ will approach a different limit. For the case, for example, where only the "yes" votes approach infinity and the numbers of "no" and "abstain" votes remain finite as t increases,

$$\lim_{\substack{y \rightarrow \infty \\ t \rightarrow \infty}} P(AG) = \frac{y^2 + n(n-1) + a(a-1)}{t^2}.$$

crease as the number of members increases, except for the case where the size of the body increases from $(3n+2)$ to $3(n+1)$ members, where $n \geq 2$ (e.g., from 8 to 9 members); in this case where the membership increases to a multiple of 3, the proportion of pairs that agree in a body as equally divided as possible remains constant with increasing membership (e.g., $7/56$ for 8 members equals $9/72$ for 9 members). *Proof.* Available from the authors on request.

If the probability of agreement between two randomly-selected members for a given distribution of votes is greater in large bodies than in small bodies on each roll call, then the expected number of agreements between two randomly-selected members across a set of roll calls will also be greater in large bodies. This "bias toward agreement" in large bodies renders our previous measure of agreement—the expected number of agreements as a percentage of total possible agreements—incomparable in voting bodies of different size.

In order to make comparisons between voting bodies (or their subsets) of different size, we must be able to show how close the votes of members of a body approach "maximum disagreement" (or "minimum agreement") on a set of roll calls. The maxima for voting bodies of different size can then be used as a baseline against which to compare the relative closeness of different bodies to maximum division.

Theorem 6. If three kinds of votes are allowed in a voting body, the probability that two randomly-selected members disagree on a roll call will be maximized when one-third of the members vote "yes," one-third "no," and one-third "abstain."

Proof. This can be proved by showing that

$$P(DG) = \frac{2(yn + ya + na)}{t(t-1)} \\ = \frac{2(yn + ya + na)}{(y+n+a)(y+n+a-1)},$$

subject to the constraint,

$$t = y + n + a,$$

has an extreme value for

$$y = n = a = t/3.$$

This is easy to demonstrate using the Lagrange multiplier method. By finding partial derivatives of the function,

$$f(y, n, a, \lambda) = \frac{2(yn + ya + na)}{(y+n+a)(y+n+a-1)} \\ + \lambda(t - y - n - a),$$

with respect to the variables y , n , a , and λ , and setting them equal to zero,

$$f_y = f_n = f_a = f_\lambda = 0,$$

we can solve these four equations for y , n , and a (as well as the multiplier, λ), whose values are all equal to $t/3$. Since the bordered principal minors alternate in sign, the first being positive, the sufficient conditions for the extreme value to be a maximum are satisfied.²³

When the number of members of a voting body is not exactly divisible by three, the probability of disagreement will be maximized when the addition or subtraction of one vote equalizes the yeas, nays, and abstentions. For example, in a 33-33-34 roll call in a 100-member body, the subtraction of one abstention would equalize the division, and thus such a vote would maximize the probability of disagreement between two randomly-selected members of the body.

For the two and three-member subsets in our hypothetical voting body, disagreement is at a maximum when each member votes differently from the other(s) on all roll calls. For such a distribution of votes, the probability that two randomly-selected members agree on one or more roll calls is equal to zero, and so, therefore, is the expected number of roll calls on which two randomly-selected members agree.

The probability of disagreement for all five members of the voting body is maximized when two members vote one way, two another, and one the third way. Since two pairs of members must necessarily agree on each roll call in such a split, the expected number of roll calls on which two randomly-selected members agree will therefore be greater than zero. In fact, for five roll calls the expected number on which two randomly-selected members agree is 1.00 when there is the above division among the five voting members on each roll call, as contrasted with an expected number of 5.00 if all five members vote the same way on each roll call. Since the expected number in our hypothetical voting body is equal to 2.40, we conclude that the voting behavior of this body is closer to the disagreement extreme than the agreement extreme. We may formalize this notion as

Definition 6. For a voting body of any size voting on any number of roll calls, its Agreement Level (AL) is

$$AL = \frac{E(AG) - E(AG_{\min})}{E(AG_{\max}) - E(AG_{\min})},$$

²³ See Taro Yamane, *Mathematics for Economists: An Elementary Survey* (Englewood Cliffs, N. J.: Prentice-Hall, Inc., 1962), p. 348. When only "yes" and "no" votes are considered, the probability of disagreement will be maximized when the members come as close as possible to a 50-50 split.

where $0 \leq AL \leq 1$ and

$E(AG)$ = expected number of roll calls on which two randomly-selected members agree (Definition 5 and Theorem 3),

$E(AG_{\min})$ = expected number when vote on each roll call is as equally divided as possible (i.e., when probability of agreement is minimized and disagreement maximized),

$E(AG_{\max})$ = expected number when all members vote the same way on each roll call (i.e., when probability of agreement is maximized and disagreement minimized).

The AL index is the only "agreement" index of which we are aware that varies between zero and one for a voting body of any size, voting on any number of roll calls, using (in principle) any number of voting options.²⁴ The larger the value of the index, the greater the amount of agreement among the members. In our hypothetical voting body,

$$AL = \frac{2.40 - 1.00}{5.00 - 1.00} = \frac{1.40}{4.00} = .35.$$

This value compares with AL values of 1.00 for the subset containing members 1 and 2 and .33 for the subset containing members 3, 4, and 5. As before, the amount of agreement is less for the subset containing members 3, 4, and 5 than for the entire body ($AL = .33$ versus .35), but by a much narrower margin than our previous calculation (33 percent versus 48 percent

²⁴ Though the proposition put forward by Aage R. Clausen that "measures of paired agreements cannot be converted into measures of group cohesion by simple summation" is not entirely clear, the AL index would seem to meet most of the objections raised by Clausen against other indices (in particular, the sensitivity of Grumm's "index of colligation" to group size and its inapplicability to individual roll calls). See Aage R. Clausen, "The Measurement of Legislative Group Behavior," *Midwest Journal of Political Science*, XI (May, 1967), 212-224; and John Grumm, "The Means of Measuring Conflict and Cohesion in the Legislature," *Southwestern Social Science Quarterly*, XLIV (March, 1964), 375-388. It should be noted that the AL index does not allow one to determine the stability of factional alignments in a voting body (a particular AL value may reflect either permanent or shifting cleavages across a set of roll calls), but later in the article we shall develop an index which will be useful in determining the most cohesive voting blocs in a body.

expected agreement on five roll calls), which did not take into account the size of a voting body, suggested.

V. MEASURING VARIANCE IN VOTING

On occasion it is useful to know not only the level of agreement in a voting body, which may be the same for many different voting patterns (e.g., the same AL index may reflect high agreement on some roll calls and low agreement on others or moderate agreement on all roll calls), but also the deviation from this level of agreement averaged across a set of roll calls. In this regard, Hayward R. Alker, Jr., and Bruce M. Russett, in a study of United Nations voting utilizing "standardized ranks" of countries on roll-call votes, employed factor analysis to construct an "index of divergence" to measure the lack of cohesiveness in voting groups on different issues over a number of years.²⁵ This index is "simply the mean deviation from the group average factor score,"²⁶ the factor scores having been derived from the correlation matrix which in turn was computed from the "standardized ranks" of all countries on all votes. The relation of this index to observable phenomena is so remote that we find it very difficult to attribute any substantive meaning to it.

A statistic for measuring the divergence (lack of uniformity) in the voting of members of a body that is "closer" to the data, and therefore more readily interpretable, can be computed from the probability measures already developed.

Definition 7. The mean squared deviation from the expected number of agreements across m roll calls (i.e., the squared deviations weighted by the probability of their occurrence), or variance in the number of agreements, is

$$\text{Var}(AG) = \sum_{x=0}^m [x - E(AG)]^2 f(m, x),$$

where $\text{Var}(AG) \geq 0$.

Theorem 7. The variance in the number of agreements on each roll call i is

$$\text{Var}(AG)_i = P(AG)_i - [P(AG)_i]^2.$$

Proof. For any single roll call i , $m = 1$ in Definition 7. Thus,

$$\begin{aligned} \text{Var}(AG)_i &= \sum_{x=0}^1 [x - E(AG)_i]^2 f(1, x)_i \\ &= [E(AG)_i]^2 f(1, 0)_i \\ &\quad + [1 - E(AG)_i]^2 f(1, 1)_i. \end{aligned}$$

²⁵ *World Politics in the General Assembly* (New Haven, Conn.: Yale University Press, 1965), p. 255.

²⁶ *Ibid.*

From Definition 2 and Theorem 1 or 1a,

$$\begin{aligned} f(1, 0)_i &= P(DG)_i = 1 - P(AG)_i, \\ f(1, 1)_i &= P(AG)_i. \end{aligned}$$

From Theorem 2,

$$E(AG)_i = P(AG)_i.$$

Substituting these values into the above equation,

$$\begin{aligned} \text{Var}(AG)_i &= [P(AG)_i]^2[1 - P(AG)_i] \\ &\quad + [1 - P(AG)_i]^2[P(AG)_i] \\ &= P(AG)_i - [P(AG)_i]^2. \end{aligned}$$

Theorem 8. The variance in the number of agreements across m roll calls is

$$\begin{aligned} \text{Var}(AG) &= \sum_{i=1}^m \text{Var}(AG)_i \\ &= \sum_{i=1}^m [P(AG)_i - [P(AG)_i]^2]. \end{aligned}$$

Proof. This result follows from the property of the variance measure that specifies the variance of the sum of a set of random variables, which are mutually independent (Axiom 2), is equal to the sum of their variances.

As we showed for the expected value in Theorem 3, so we have shown here that the variance in the number of agreements across a set of roll calls is solely a function of the probability of agreement, $P(AG)_i$, on each roll call i . Thus, knowing only the distribution of different kinds of votes on each roll call, from which the probabilities of agreement on each roll call can be calculated, we can compute the over-all Agreement Level (AL) as well as the variance in the number of agreements across a set of roll calls.

For members 1 and 2 of the voting body, the variance is equal to zero because their voting on all roll calls is identical. The variance for members 3, 4, and 5 is equal to .44; for all five members of the voting body, the variance is equal to .82. Thus, the *dispersion* in voting about the expected number of roll calls on which two randomly-selected members agree—that is, the “spread” or “scatter” in the distribution—is greatest in the entire body, despite the fact that the entire body has a slightly higher AL value than the subset containing only members 3, 4, and 5.

Roughly speaking, we might say that the addition of members 1 and 2 to the subset containing members 3, 4 and 5 has two effects: (1) it raises the Agreement Level among the members after the effects of body size have been removed; at the same time, (2) it increases the over-all deviation (variance) of the members from the expected value for the body. In other words, it is possible for members to have a

high level of agreement, but the deviations from this level might also be high. In general, the variance will be greater across a set of roll calls when there is *moderate* agreement on each roll call i ($P(AG)_i \rightarrow \frac{1}{2}$)—that is, some “spread” in the distribution of the number of agreements—rather than *high* agreement on some ($P(AG)_i \rightarrow 1$) and *low* agreement on others ($P(AG)_i \rightarrow \frac{1}{3}$)—that is, little “spread,” with most members tending either to agree or disagree on each roll call. Why this is so can be seen from the next theorem.

Theorem 9. The variance in the number of agreements on any roll call i is maximized when $P(AG)_i = \frac{1}{2}$.

Proof. Let $y = \text{Var}(AG)_i$ and $x = P(AG)_i$. Then Theorem 7 states

$$y = x - x^2, \quad \text{where } 0 \leq x \leq 1.$$

This function has an extreme value when the first derivative, y' , equals zero, i.e.,

$$y' = 1 - 2x = 0, \text{ or } x = \frac{1}{2},$$

which is a maximum since the second derivative, $y'' = -2$, is negative.

Definition 8. For a voting body of any size voting on any number of roll calls, its Variance Level (VL) is

$$VL = \frac{\text{Var}(AG)}{\text{Var}(AG)_{\max}},$$

where $0 \leq VL \leq 1$ and

$\text{Var}(AG)$ = Variance in the number of agreements across a set of roll calls (Definition 7 and Theorem 8),

$\text{Var}(AG)_{\max}$ = Variance in the number of agreements across a set of roll calls when $P(AG)_i$ for each roll call i is as close to $\frac{1}{2}$ as possible.

We use the term “as close to $\frac{1}{2}$ as possible” to indicate the fact that in some voting bodies no possible division of the vote can give a probability value exactly equal to $\frac{1}{2}$. For example, in a three-member voting body with two voting options, $P(AG)_i$ may equal 1, $\frac{1}{3}$, or 0 on any roll call i . Since the value $\frac{1}{3}$ is as close to $\frac{1}{2}$ as can be achieved, this $P(AG)_i$ value would be used in the calculation of $\text{Var}(AG)_{\max}$, and the VL index, across a set of roll calls for this body. This convention insures that the VL index always has a maximum *achievable* value of 1; for bodies of moderate size, however, the maximum achievable value will usually be very close, or equal, to the maximum theoretical value (i.e., where $P(AG)_i = \frac{1}{2}$ in the $\text{Var}(AG)_{\max}$ term for each roll call i).

TABLE 3. VALUES OF $P(AG)_i$ ON EACH ROLL CALL i THAT MAXIMIZE AND MINIMIZE THE AL AND VL INDICES FOR A VOTING BODY WITH THREE VOTING OPTIONS

Index	Maximum Value When	Minimum Value When
AL	$P(AG)_i = 1$	$P(AG)_i \approx \frac{1}{2}$
VL	$P(AG)_i \approx \frac{1}{2}$	$P(AG)_i = 1$

Like the AL index, the VL index has a convenient zero-to-one range that makes it useful in the comparative analysis of voting bodies of different size, as well as those with different numbers of voting options whose members vote on different numbers of roll calls. In our example where the values of $\text{Var}(AG)$ were .44 for members 3, 4, and 5, and .82 for all five members, the "normalized" VL values are .40 and .68, indicating that the difference in the amount of dispersion between the body and its subset is less than we were led to believe by the $\text{Var}(AG)$ statistic, which does not give comparable values for bodies of different size. Incidentally, we do not define the VL index for a body containing only two members, because there are only two $P(AG)_i$ values for this body (0 and 1), which are both equally close to the value $\frac{1}{2}$ and which both make the denominator of the VL index, $\text{Var}(AG)_{\max}$, equal to the unruly value of zero.

Although we shall not formalize these results as theorems, it is interesting to note that the Agreement Level is at a maximum ($AL=1$) and the Variance Level at a minimum ($VL=0$) only when there is unanimous agreement in the body. That is, $AL=1$ if and only if $VL=0$ (i.e., when $P(AG)_i=1$ on each roll call i); on the other hand, minimal agreement ($AL=0$) is not equivalent to maximal variance ($VL=1$). This is so because when the body is as equally divided as possible among the different voting options ($AL=0$), the probability of agreement will not necessarily be as close to $\frac{1}{2}$ as possible, which maximizes the variance ($VL=1$). These results are summarized in Table 3 for a voting body with three voting options. In the minimum AL case, the "approximately equal to" sign (\approx) becomes an "equal" sign only in the limit as the body approaches infinite size; in the maximum VL case, it becomes an equal sign only if it is an *achievable* value for a voting body on a given roll call i .

VI. MEASURING AGREEMENT BETWEEN PAIRS

At times we may not have sufficient information to identify blocs of actors for the purpose

of computing the Agreement Level and Variance Level in their voting. In order to identify blocs with a high degree of internal cohesion, it is often necessary to compute indices of agreement for all pairs of actors as a first step.

Many ingenious schemes have been devised for identifying and measuring the cohesiveness of voting blocs. Arend Lijphart, in reviewing defects in some of these schemes, singled out those schemes, among others, that required attitudes to be scalable along a single dimension, failed to take account of the incomparability of cohesiveness in groups of different size, ignored abstentions, etc. He then went on to propose an agreement index based on the percentage of times two countries agree or partially agree (one country abstains) on a set of votes, with partial agreement being accorded half the weight of complete agreement. From a sample of 44 roll-call votes on colonial issues in the UN General Assembly between 1956 and 1958, Lijphart computed agreement indices for all pairs of countries and then used them to identify, and measure the cohesiveness of, voting blocs.²⁷

In the previously-cited study of UN voting by Alker and Russett, the authors assigned "standardized ranks" to each "yes," "no," and "abstain," in a manner too complicated to describe here, and used them to calculate correlation coefficients to measure voting agreement between pairs of countries.²⁸ In a more recent study, Russett assigned each country a voting score of 2 (affirmative), 1 (abstain and most absences), or 0 (negative) on all 66 roll-call votes which were not unanimous or nearly unanimous in the Eighteenth (1963) Session of the General Assembly and used the Q-technique of factor analysis to extract from the correlation matrix of countries, based on their voting scores, the most cohesive voting groups.²⁹

Despite their obvious technical sophistication, all these recent studies suffer from one serious drawback: they ultimately rest on the assignment of arbitrary values to the different voting options in a body. In his analysis of voting groups in the Eighteenth Session, Russett offers no justification for his assignment of the arbitrary values 2, 1, and 0 to affirmative votes, abstentions and most absences, and negative votes, respectively, though the assumption implicit in this assignment is that abstentions and most absences fall between affirmative and negative votes on some kind of

²⁷ Lijphart, *op. cit.*

²⁸ Alker and Russett, *op. cit.*, pp. 30-31.

²⁹ "Discovering Voting Groups in the United Nations," this REVIEW, LX (June, 1966), 327-339.

continuum.³⁰ We fail to see any stronger justification in Alker and Russett's use of "standardized ranks," though the claim is made that they have a "nice . . . operational interpretation."³¹ Lijphart convincingly demonstrates the advantages of his index over others but confesses that crediting a partial agreement with half the weight of a complete agreement is a "tenuous assumption."³² Although there may be no "sacrosanct technique," as Alker and Russett admit,³³ for assigning scores to the different voting options in a body, at a minimum any scheme should avoid the assignment of arbitrary numerical values or ranks to yeas, nays, and abstentions for the purpose of computing indices of agreement between pairs.

Our *a posteriori* probabilities of agreement between a randomly-selected pair of members, because they are derived from the actual distribution of yeas, nays, and abstentions on each roll call, avoid this pitfall which has plagued previous studies. The expected number of roll calls on which two randomly-selected members agree, based on these probabilities, seems to provide as good a yardstick as any against which to assess the extent to which two members agree in their voting. Expressing the deviation from the expected number of roll calls on which each pair of members agrees in relative terms, we arrive at

Definition 9. The Relative Agreement, RA_{ij} , of members i and j across a set of roll calls is

$$RA_{ij} = \frac{AG_{ij} - E(AG_{ij})}{E(AG_{ij})}.$$

where

AG_{ij} = the actual number of times members i and j agree across a set of roll calls,

$E(AG_{ij})$ = the expected number of roll calls on which a randomly-selected pair of members, for all roll calls on which members i and j are both present and voting, agree.³⁴

³⁰ The consequences of such assumptions on the values of correlation coefficients are shown in Johan Galtung, *Theory and Methods of Social Research* (New York: Columbia University Press, 1967), pp. 216-218.

³¹ Alker and Russett, *op. cit.*, p. 30, fn. 18.

³² Lijphart, *op. cit.*, p. 910, fn. 41.

³³ Alker and Russett, *op. cit.*, p. 30.

³⁴ We append the subscripts i and j to $E(AG)$ in the index to underscore the fact that only the roll calls on which members i and j are both present and voting are used in the calculation of the expected value, $E(AG_{ij})$, for each RA_{ij} index.

Theorem 10. The maximum RA_{ij} for a voting body decreases as the body gets larger and larger, approaching the limit of 2 as the size of the voting body, t , approaches infinite size, i.e.,

$$\lim_{t \rightarrow \infty} (RA_{ij})_{\max} = 2.$$

Proof. Available from the authors on request. Basically, what is shown in the proof is that the maximum value of RA_{ij} does not depend on the number of roll calls but only on (1) the size of the voting body and (2) the distribution of votes. With regard to the distribution of votes, RA_{ij} for two agreeing members is at a maximum when the votes are as equally divided as possible among the "yes," "no," and "abstain" positions. As for size, the maximum RA_{ij} decreases as the size of the body increases: for a body of four members, the maximum RA_{ij} is 5.00; for five members, 4.00; for ten members 2.75; and for a body of twenty members, no two members can agree more than 2.33 times the expected number ($E(AG_{ij})$) of agreements per pair for the body. Thus, the maximum RA_{ij} for a body of four members (5.00) is more than twice as great as for a body of twenty members (2.33).

The RA_{ij} values for our hypothetical voting body are given in Table 4 and indicate that only members 1, 2, and 4 are positively linked, all with each other, with members 1 and 2 hav-

This index is adapted with modifications from one used, among other places, in Steven J. Brams, "Transaction Flows in the International System," this REVIEW, LX (Dec., 1966), 880-89; and Steven J. Brams, "Trade in the North Atlantic Area: An Approach to the Analysis of Transformations in a System," *Peace Research Society: Papers*, VI (Vienna Conference, 1966), 143-164. Although the transaction-flow model is applied to international transaction data in the above articles, it is not necessary to assume that votes are transactions to use as a measure from the model to analyze voting data. For some purposes, however, the act of agreeing or disagreeing with other members of a voting body might be considered a "symbolic transaction." Another useful index for measuring agreement between pairs is the phi coefficient, but as used by Ulmer (*op. cit.*) and others it does not allow for more than two voting options. Jacobsen's measures of "voting agreement" and "voting concordance" do take into account abstention votes, but the theoretical import of these measures is left largely unspecified. See Kurt Jacobsen, "Voting Behavior of the Nordic Countries in the General Assembly," *Cooperation and Conflict*, III, No. 4 (1967), 139-157.

TABLE 4. RELATIVE AGREEMENTS (RA_{ij})
FOR EACH PAIR OF MEMBERS

Member	1	2	3	4
2	1.08			
3	-.17	-.17		
4	.67	.67	-.17	
5	-.58	-.58	-.58	-.17

ing more than twice the expected number of roll call agreements with each other ($RA_{12} = RA_{21} = 1.08$). Members 3 and 5 have no positive links with any other members in the body, including each other, and therefore might be properly classified as isolates. For larger bodies, of course, simple inspection of the RA_{ij} matrix will not be sufficient to identify the most cohesive voting blocs, but many data-reduction techniques are now available for delineating the most tightly-linked subgroups on the basis of a variety of linkage criteria.³⁵

³⁵ For a review of some of these techniques, see Geoffrey H. Ball, "Data Analysis in the Social Sciences: What About the Details?" *Proceedings—Fall Joint Computer Conference*, 1965, pp. 533-559; J. J. Fortier and H. Solomon, "Clustering Procedures," in Paruchuri R. Krishnaiah (ed.), *Multivariate Analysis* (New York: Academic Press, 1966), pp. 493-506; Stephen C. Johnson, "Hierarchical Clustering Schemes," *Psychometrika*, XXXII (Sept., 1967), 241-254; and Hayward R. Alker, Jr., "Statistics and Politics: The Need for Casual Data Analysis" (paper presented at the Annual Meeting of the American Political Science Association, Chicago, September 5-8, 1967). A discussion of the relative merits of different clustering techniques would take us too far afield of our analysis at this time; our attempt here is only to suggest a measure of agreement for all pairs to which these techniques can be applied. We also note in passing that roll calls might be grouped into sets of issues by measuring "agreement" among them across the votes of the members. We can do this by first calculating the "total" probability of agreement for a randomly-selected pair of members on two roll calls as the sum of the products of the $P(AG)_{i's}$ and $P(DG)_{i's}$ for the two roll calls (assuming they are independent events). For example, for roll calls 1 and 2 given in Table 1, the probability that a randomly-selected pair of members will agree on both roll calls is $(.3)(.2) = .06$, disagree on both, $(.7)(.8) = .56$; for a randomly-selected pair, therefore, its "total" probability of agreement (by either agreeing on both roll calls or disagreeing on both roll calls) is $.06 + .56 = .62$. Since there are 10 pairs of members in a five-member body,

Given the identification of voting blocs on the basis of either empirical or *a priori* criteria, one may then be interested in measuring agreement between blocs. For this purpose we shall define a group RA_{IJ} .

Definition 10. The relative agreement of subsets I and J , each of which might comprise several different individual actors, is

$$RA_{IJ} = \frac{\sum_{i,j} A_{ij} - \sum_{i,j} E_{ij}}{\sum_{i,j} E_{ij}}$$

Each of the summations on the right-hand side of the equation ranges over all individual actors i and j that are members of each of the respective (disjoint) subsets, I and J .

VII. MEASURING THE SUPPORT OF MEMBERS

So far the concepts we have defined, applicable to a voting body as a whole (AL and VL) and pairs of members (RA_{ij}), all have depended on the probability of agreement, $P(AG)_i$, between two randomly-selected members on each roll call i . We shall now lay the groundwork for a concept applicable to individual members that is analogous to RA_{ij} but based on a different set of probabilities, which we define below.

Definition 11. If t is the total number of members present and voting on roll call i , the probability that a randomly-selected member supports the majority (or plurality) is

$$P(S)_i = \frac{o_{\max}}{t},$$

where o_{\max} is equal to the number of members choosing that option which receives, or is tied

the expected number of agreements for the 10 pairs is $(10)(.62) = 6.2$. In fact, for roll calls 1 and 2, 7 of the 10 pairs agree or disagree on both roll calls. In the same way in which we computed RA_{ij} for members i and j , we can compute RA_{IJ} for roll calls as the difference between the actual and expected, divided by the expected, number of pairwise agreements on both roll calls. In the above example.

$$RA_{12} = \frac{7.0 - 6.2}{6.2} = .13,$$

which indicates a greater-than-expected (i.e., positive) level of "agreement" between roll calls 1 and 2. Thus, while our focus in this article has been on measuring agreement among members across a set of roll calls, the above procedure would allow one to compute RA_{ij} indices, analogous to those given in the text, that measure the "agreement" between pairs of roll calls instead of between pairs of members.

for, the greatest number of votes. Whereas $P(AG)_i$ was defined for a randomly-selected pair on roll call i , $P(S)_i$ is defined for a randomly-selected individual member, and its values for our hypothetical voting body are given in Table 5.

In the same manner in which we computed $E(AG)$ from the $P(AG)_i$'s on each roll call i , we can compute an expected value of support, $E(S)$, for the majority (or plurality) across a set of roll calls.

Definition 12. The expected number of roll calls on which a randomly-selected member votes with the majority (or plurality) is

$$E(S) = \sum_{i=1}^m E(S)_i = \sum_{i=1}^m P(S)_i.$$

For our hypothetical body, $E(S)=3.4$, which means that a randomly-selected member would support a majority (or one of the two tied pluralities on roll call 2) on an average of 3.4 out of 5 roll calls.

Now we could substitute $E(S)$ for $E(AG)$ in the AL and VL indices, and, with appropriate changes in the definitions of the minimum and maximum expected values in the AL index, come up with new measures of agreement and variance in voting based on the probabilities of support defined for members on each roll call rather than the probabilities of agreement defined for pairs. In addition to our desire to keep new concepts to a minimum, however, the main reason for not introducing these new concepts is that the member probabilities do not capture as much information as our previously-defined pair probabilities.

This is because $P(AG)_i$ for each roll call i is a function of the number of members voting on all options, while $P(S)_i$ depends only on the number choosing the option that receives the most votes. If there were three voting options and a plurality voted "yes," for example, $P(AG)_i$ would reflect not only this plurality but also the number of members voting "no" and "abstain," while $P(S)_i$ would be insensitive to the distribution of "no" and "abstain" votes. Thus, it would seem that the most useful measures of voting agreement and variance

for the body as a whole are the previous AL and VL indices based on the $P(AG)_i$'s, which tap all information on the voting divisions in a body.

It is interesting to note that in a large body whose members split evenly among the different voting options on any roll call i , $P(S)_i \approx P(AG)_i$ ($\approx \frac{1}{3}$ when there are three options), but in general $P(S)_i$, defined for a randomly-selected member, bears no necessary relationship to $P(AG)_i$, defined for a randomly-selected pair. This is somewhat dismaying to our purpose of trying to explicate through theorems logical relationships among our different measures of voting behavior (as we were, for example, able to relate the AL and VL indices to each other because they were both based on $P(AG)_i$), but the introduction of the new probabilities, $P(S)_i$, has proved necessary in order to define a measure of voting support which individual members tend to give to the majority (or plurality) on roll calls.

Definition 13. The Support Level (SL_j) for each member j across a set of roll calls is

$$SL_j = \frac{A(S_j) - E(S_j)}{E(S_j)},$$

where

$A(S_j)$ = the actual number of roll calls on which member j votes with the majority (or plurality),

$E(S_j) = \sum_{i=1}^m E(S_j)_i = \sum_{i=1}^m P(S_j)_i$ = the expected number of roll calls on which a randomly-selected member, for all roll calls on which member j is present and voting (assumed in above summations to be equal to m), votes with the majority (or plurality).³⁶

We can establish the upper and lower limits of SL_j in a more informal manner than we did for the RA_{ij} index. Clearly, SL_j will be minimal when member j never agrees with a bloc with the most votes ($A(S_j)=0$), so the lower limit of SL_j will always be equal to -1 , regardless of the number of voting options. On the other hand, the index will be maximal when member j agrees with a largest voting bloc on all m roll calls and these largest blocs on each roll call are of minimal size ($E(S_j)=m/3$ when there are three voting options). For a voting body with three voting options, therefore, the upper limit of SL_j is

³⁶ As with the RA_{ij} index, we append the subscript j to $E(S)$ to underscore the fact that only the roll calls on which member j is present and voting are used in the calculation of the expected value, $E(S_j)$, for SL_j indices of each member j .

TABLE 5. $P(S)_i$'s FOR EACH ROLL CALL i

Roll Call i	$P(S)_i$
$i=1$.6
$i=2$.4
$i=3$.8
$i=4$.6
$i=5$	1.0

$$SL_{ij(\max)} = \frac{m - m/3}{m/3} = 2.$$

It will be recalled that RA_{ij} also ranges between -1 and 2 in large bodies, which should not be surprising since it is a completely analogous index, differing only in that it is based on probabilities defined for pairs rather than for individual members.

Values of SL_j for each member j of our hypothetical voting body are given in Table 6 and pinpoint members 1, 2, and 4 as supportive of the largest voting blocs (which mainly include each other) and members 3 and 5 as diverging sharply from the majority position. From the considerable difference between these two sets of values, it would appear that some members—out of conviction, influence being exerted on them, the desire to side with a largest voting bloc, or other reasons—vote with most of their fellow members and others do not.

It should be noted that even though members 1, 2, and 4 agree with the majority (or tied pluralities in the case of roll call 2) on all five roll calls, they differ substantially from the maximum theoretical upper limit of 2. This is due to the fact that SL_j is also a function of the size of the largest voting bloc and attains its maximum value for a member only when this bloc tends to be as small as possible on each roll call. In a five-member body with three voting options, two members are the smallest plurality possible, and this division occurs on only one roll call (roll call 2) in our hypothetical body. This accounts for the fact that even though members 1, 2, and 4 vote with a largest bloc on all five roll calls, they are only 47 percent more "supportive" than expected.

The concept of an expected level of support incorporated in the SL_j index, generated from the actual voting patterns in a body, could be particularly useful in comparative analyses of voting bodies. Without this expected level as a baseline for comparison, calculations of support for a member or bloc would not distinguish between support in bodies that tended to be closely divided and those characterized by large majorities on many roll calls. In those

bodies that tended to be closely divided, the expected level of support would be low, so SL_j would be high for those members j who lent their support on most roll calls. In voting bodies where roll calls tended toward unanimity, on the other hand, the expected level of support would be high, so even the most highly supportive members would not exceed the expected level by a wide margin, and their SL_j 's would therefore be low.

To be sure, the SL_j index will rank members of a body, who vote on the same roll calls, in the same order as the simpler statistic measuring "percentage agreement with a largest voting bloc."³⁷ For comparative purposes, however, SL_j would distinguish, by giving added weight to, a member of a closely-divided body who tends to support "minimal" largest voting blocs from a member of a less closely-divided body who tends to support large majorities. Thus, even though two voters might have the same "percentage agreement" scores in different voting bodies, our SL_j index credits the voter who tends to align himself with smaller pluralities in the closely-divided body with more "support."

This bias in the operational concept well reflects the greater marginal importance a coalition leader normally would attribute to the member or members who "just make" the coalition a largest bloc (or a majority) than the members who join later and are superfluous to victory.³⁸ Though we cannot determine in most voting situations the order in which members join a coalition prior to a ballot, it seems reasonable to assume that the "support" a plurality or majority of members receives from a voter is inversely related to its size: the more members a largest bloc contains, the less support that can be attributed to individual members of the bloc.

If less attribution of support results in smaller payoffs to members, then the coalitions

TABLE 6. SL_j 's FOR EACH MEMBER j

$j = 1$.47
$j = 2$.47
$j = 3$	-.41
$j = 4$.47
$j = 5$	-.41

³⁷ A similar statistic is Edward T. Rowe's "win-loss score," described in his "Changing Patterns in the Voting Success of Member States in the United Nations General Assembly: 1945-1966," *International Organization*, 23 (Spring, 1969), 235.

³⁸ William H. Riker ("A Method for Determining the Significance of Roll Calls in Voting Bodies," *op. cit.*) has incorporated this idea in his measure of the "significance" of roll-call votes. For a critique of some technical aspects of Riker's index, see William P. Yohe, "Riker's Method for Assessing the Significance of Roll Call Votes," *Public Choice*, IV (Spring, 1968), 59-66.

which maximize payoffs will tend to be of minimal winning size. Indeed, insofar as voting can be considered a zero-sum game, Riker has shown that it is not rational for a coalition of minimal winning size to accept additional members, though it may not be able to exclude them in voting situations.³⁹ There may be circumstances, however, under which it is rational to allow additional members in a larger coalition when they permit the formation of *several* different minimal winning coalitions that can be put together from different subsets of the larger coalition and whose *combined* preferences are preferable to those that could be achieved by a single minimal winning coalition always containing the same members.⁴⁰

We need not restrict our measure of support only to a largest voting bloc. We could use it to measure the support of each member of a voting body for any particular subgroup of agreeing members, not necessarily a plurality or majority, above and beyond the number of agreements we would expect from a randomly-selected member. For example, if members 1 and 2 in our hypothetical voting body, who constitute a plurality (but not a majority) of members who vote the same way on all roll calls, were our standard of comparison, then $SL_1 = SL_2 = .47$ would remain the same as before, as would $SL_3 = -.41$, because member 3's two previous agreements with a largest voting bloc were also agreements with members 1 and 2. However, members 4 and 5 would each lose an agreement, namely that with a largest bloc of two abstaining voters (themselves) on roll call 2, which are not agreements with members 1 and 2 (also a largest bloc on that roll call). As a consequence, the SL_j 's of members 4 and 5 are lower (.18 and $-.71$, respectively) than they were (.47 and $-.41$, respectively) when support was counted for *any* largest bloc on a roll call. Similarly, we could compute SL_j 's of all members with member 3 or member 4 or member 5 as the standard of comparison, which would give us an index of support, in relation to an expected level for a randomly-

selected member, for the voting of each member against these individual members.⁴¹

The notion of an expected level of support is not necessarily descriptive of any particular member's voting behavior but rather serves as a norm against which to assess deviations in each member's voting. Where this norm is based on support of the majority (or whatever the number required by the decision rule of the body), those with the highest SL_j 's will be those who most consistently align themselves with the winning side. This is not an easy task for a member to perform across a set of roll calls in a closely-divided body, and it therefore may be interesting to measure how nearly each member approaches this ideal. While this is not a strategy each member wishes or tries to pursue, in some contexts being consistently on the winning side might be used as a measure of an actor's influence.⁴²

These and other questions seem worthy of further investigation, and in the next section we shall suggest how the operational concepts derived from, or related analogously to, the model might be used in the testing of empirical hypotheses.⁴³

VIII. APPLYING THE MODEL AND TESTING HYPOTHESES

In applying the model to specific empirical situations, it is usually convenient to assume that members who vote together share common attitudes and interests. The model can

⁴¹ The standard might even be an ideological position (e.g., liberal versus conservative), where those voting "yes" on some roll calls, and "no" or "abstain" on others, would be interpreted as supportive.

⁴² This would tend to be the case for the member instrumental in putting together winning coalitions but not for the member simply shrewd enough to foresee the winning position and to align himself with it. This is the "problem of the chameleon," recognized by Dahl in his attempt to rank the influence of United States Senators on the basis of the differences between the proportion of times a bill passed the Senate when a Senator favored it and the proportion of times a bill passed when he opposed it. See Robert A. Dahl, "The Concept of Power," *Behavioral Science*, II (July, 1957), 209-214.

⁴³ For this purpose, a write-up and source deck of a computer program called PROVOTE, which computes all the indices in the model, are available from the Academic Computer Center, New York University, Washington Square, 725 Commerce Building, New York, N. Y. 10003.

³⁹ William H. Riker, *The Theory of Political Coalitions*, op. cit., esp. pp. 32-101.

⁴⁰ This may in part explain why a majority party in a legislature, of greater than minimal winning size, stays together: it can win on individual roll calls by pulling together *different* subsets of its members, which may be less costly than relying on one subset (i.e., a single minimal winning coalition with always the same members on each roll call), to hold the line.

easily be adjusted, however, to situations where members may vote the same way for different reasons. If there were evidence, for example, that there was no commonness of interests reflected in abstentions (or absences) on a set of roll calls, one might either exclude abstainers (or absentees) from the analysis or assign them, on the basis of other information, to affirmative and negative positions. Alternatively, one could subdivide abstainers (or absentees) into finer classes (e.g., "weak" affirmative and "weak" negative) and compute the probabilities of agreement on the basis of more than the three kinds of votes assumed in the preceding analysis.⁴⁴

The analysis is, in fact, generalizable to whatever voting or nonvoting criteria the analyst chooses to use in identifying actors who take particular positions, however many, on a set of issues. Besides positions taken on roll calls, other kinds of commitments which actors periodically make in political life include decisions to join or withdraw from a coalition or alliance, establish or sever diplomatic relations, support or oppose candidates for political office, issue policy declarations, etc. Like roll calls, all these forms of political commitment suggest agreement with some actors and disagreement with other actors in a political system.

As an example of the application of the model to nonvoting data, consider Morton A. Kaplan's proposition that in a balance of power system "any alignment is as probable as any other alignment prior to a consideration of the specific interests which divide nations."⁴⁵ If we consider alignments to be defined by the different associations of countries in wars, where the belligerents in effect elect different voting options and the nonbelligerents abstain, then the equiprobability of different alignments could be translated into a proposition about the tendency of RA_{ij} scores to be equal, i.e., approach zero, for each pair. In the "classic" balance-of-power period of the nineteenth and early twentieth centuries, a preliminary analysis of RA_{ij} scores of European countries, where the twelve wars during the period involving at least one major power (beginning with the Franco-Spanish War in 1823 and ending with

World War I) represent the "roll calls" of the model, reveals that most countries tended to associate considerably more frequently with some countries than others, which would seem to reflect the upsetting influence of "specific interests" in the proposition.⁴⁶

In some cases it is relatively easy to gather systematic information on the positions taken by a political actor (e.g., a newspaper); in other cases these data are more elusive, and it may not always be easy to draw up a homogeneous set of discrete acts of political commitment over time from which agreement or disagreement with other actors can be surmised. (Interviews and questionnaires would be possible instruments that could be used to make data on the positions of actors more comparable.) Provided suitable data can be obtained, however, the comparative empirical indicators described in this article would seem to provide one means for transforming the widespread and recurrent commitments made by political actors into testable hypotheses on such processes as census formation, coalition building, and conflict resolution in political systems.

To illustrate this point, consider Riker's "size principle," which states that in social situations similar to n -person, zero-sum games where side payments are permitted, whose players are rational, and where they have perfect information, only minimum winning coalitions occur.⁴⁷ As applied to voting bodies, we would expect that one implication of the size principle when the above assumptions are met is that the Agreement Level in a voting body will remain unaffected by the distribution of seats by party. For example, in a legislature containing only two parties, the Agreement Level should remain constant no matter what percentage of seats are held by the majority party.

For the roll calls of six recent sessions of the United States House of Representatives, David H. Koehler compared the percentage of seats held by the majority party in each session, which varied between 51 percent (83d Session) and 68 percent (89th Session), with the value of the AL index based on roll calls in that session.⁴⁸ On most roll calls, to be sure, the winning coalition had more than a bare majority,

⁴⁴ This feature of the model would seem to make it especially useful in the study of judicial bodies, whose members may not only associate themselves with or against the majority opinion but may also express particular qualifications in individual affirming or dissenting opinions.

PREDICTION OF THE SIZE PRINCIPLE

FIG. 3

indicating that the size principle was not confirmed in an "absolute" sense on every roll call. Under a less strict interpretation, however, evidence supporting an implication of the size principle over a longer time span was found: the value of the AL index of the House in sessions where the party division was nearly equal did not differ appreciably from its value in sessions where one party held a lopsided majority of the seats.⁴⁹

The size principle might be tested comparatively for a number of different legislative bodies by comparing the AL index based on roll-call votes in a legislative session with the AL index based upon the seat shares of each party. In the computation of the latter index, each party's seats, in effect, could be treated as the number of votes cast a particular way on a single roll call. As shown in Figure 3, the size principle would predict that the AL index based on roll calls would not depend on the AL index based on seats held by each party in different sessions.

⁴⁹ An alternative explanation for the constancy in the level of agreement in different sessions might be "situational": if the ideological differences between the two parties are not great, then the cost of assembling a winning coalition across party lines, often necessary when the majority party has only a small edge over the minority party, would not differ appreciably from the cost of assembling a winning coalition within the majority party when it has a big edge. If the same amount is expended on coalition building in each case, it should buy winning coalitions of approximately the same size. Thus, when ideological differences between parties are slight and a fixed amount (or percentage) of resources tends to be spent on coalition building in a session, the level of agreement in the session should be approximately the same whether one's party majority is large or small.

As another example of the use of the AL index in the testing of a hypothesis, consider the observation that in multi-ballot national party conventions one candidate typically has almost a majority on the first ballot, loses strength on the next few ballots to other candidates, one of whom eventually moves toward a majority on the last few ballots. To frame this observation as a quantitative hypothesis and thereby make possible a more precise test of its validity, we would predict that, where the voting options are different candidates, the value of the AL index will be quite high on the first ballot, trial off on the next few ballots, and rise again on the last few ballots.

A test of this hypothesis reveals that it is in fact upheld only for the 1844 and 1852 Democratic conventions. In the twenty-four other Democratic and Republican multi-ballot conventions that have occurred since 1844, the AL index, on the average, tended to hover around .20 over about the first 75 percent of the ballots, and then to increase slightly until the final ballot, when agreement soared rapidly over the level needed to achieve nomination. This pattern in which a point is reached in a convention when a large number of delegates suddenly decides to support a particular candidate (the "bandwagon effect") tends to characterize conventions operating under both a simple majority rule and those where a two-thirds majority is necessary for nomination (i.e., Democratic conventions prior to 1936, except for the conventions of 1860 and 1920).⁵⁰

It would seem that other interesting questions might be asked, and hypotheses tested, utilizing the empirical indicators developed in the model. Like the AL index, is the VL index independent of party alignments in a legislative body? Are high SL_j scores of members associated with measures of influence not based on votes (e.g., seniority, committee assignments)? What are the best predictors of high RA_{ij} scores between pairs of members? These and other questions are all susceptible to empirical analysis which, given the applicability of the indices to any voting body as well as nonvoting situations, could probably most fruitfully be conducted on a comparative basis.

IX. SUMMARY AND CONCLUSION

To recapitulate, we began our analysis of voting in legislative and judicial bodies by showing how voting could be conceived of as a mapping between the members of a body and the voting options available in the body. This

⁵⁰ Timothy K. Barnekov, "Measuring Agreement in National Party Conventions" (unpublished paper, Syracuse University, 1969).

allowed us to determine the numbers of members who chose each voting option on each roll call, and with these numbers as the parameters of the model we were able to compute *a posteriori* probabilities that two randomly-selected members agree on zero or more roll calls. From these probabilities, we in turn were able to calculate the expected number of roll calls on which two randomly-selected members of a hypothetical voting body of five members, and subsets of the body comprising two and three members, agree. After noting that the number of pairwise agreements in a voting body would depend not only on the distribution of votes but also the size of the body, we then developed an Agreement Level (*AL*) index that eliminated the "bias toward agreement" effect in larger bodies and therefore could be used in the comparative analysis of voting bodies of any number of members. An analogous index of the Variance Level (*VL*) indicated that the voting of members of our hypothetical body and certain of its subsets exhibited different degrees of dispersion from the expected values.

In order to identify the most cohesive voting blocs, we then defined Relative Agreement (*RA_{ij}*) indices for each pair of members (as well as groups) that avoided the arbitrary assumptions made in other studies about the assignment of voting scores to different voting options. These indices showed that not only was voting nonrandom in the body but that its members could be partitioned into one three-member bloc and two isolates on the basis of their voting. We concluded the development of the formal model by defining a Support Level (*SL_j*) index for individual members, related analogously but not directly to the Relative Agreement index for pairs, that measured the extent to which a member supported the majority, or any other, position taken by one or more agreeing members on each roll call. In sum, we were able to derive in our model comparative indicators of voting behavior for three different units of analysis—the body as a whole (*AL* and *VL*), pairs of members (*RA_{ij}*), and individual members (*SL_j*)—as well as to develop some implications of these indicators in the form of several theorems.

We then suggested how information about a voting body, in addition to the roll-call votes of its members, could be used to tailor the model more closely to a particular empirical situation. We also indicated how other forms of political commitment besides voting could be made amenable to the methods of comparative analysis described in the article. Finally, we presented some examples of testable hypotheses, with some preliminary empirical results,

that incorporated indicators developed in the model.

In conclusion, we have tried to show in our formalization how meaning can be wrung out of a simple set of parameters and axioms in the form of new concepts derived from the parameters and new theorems deduced from the axioms that (1) logically organize important features of voting bodies in an economical and perspicuous way, and (2) provide operational indicators of voting behavior. While our indicators, like any summary measures, abstract only certain aspects of a situation, they at least are based on a set of explicit *and* interpretable axioms that suggest how and in what ways they distort reality. In particular, our simplifying "independence" axiom unquestionably does violence to the "reality" of voting in many actual bodies, but it gives us great leverage in generating a stock of concepts and theorems that throws into bold relief certain idealized aspects of a voting body. If at a later stage empirical research suggests other useful concepts and axioms (e.g., about coalitions), or a modification of old ones, then these can be formally introduced into the model and new theorems proved. Eventually these theorems should carry us beyond the realm of formulation and clarification of concepts—our primary task in the development of the model so far⁵¹—and instead should help us discover nonobvious relationships between concepts that shed light on basic political processes (e.g., of coalition building⁵²). Insofar as these concepts can be operationally defined and hypotheses linking them tested, parts of the formal model will be subject to empirical validation. Then the further revision of the model, and the testing of its implications, can begin again.

⁵¹ We do not wish to stress, however, too rigid a distinction between "concept formation" and "theory formation," which in Hempel's words "are so closely interrelated as to constitute virtually two different aspects of the same procedure." Carl G. Hempel, *Fundamentals of Concept Formation in Empirical Science* (Chicago: University of Chicago Press, 1952), pp. 1-2.

⁵² For an attempt in this direction, see Steven J. Brams and William H. Riker, "Models of Coalition Formation in Voting Bodies" (paper presented at the Annual Meeting of the American Association for the Advancement of Science, Boston, Dec. 26-31, 1969); and Steven J. Brams, "A Cost/Benefit Analysis of Coalition Formation in Voting Bodies" (unpublished paper, New York University, Feb. 1970). The assumptions of the models in these papers, however, are not related to those of the present model.

ADDITIVE AND MULTIPLICATIVE MODELS OF THE VOTING UNIVERSE: THE CASE OF PENNSYLVANIA: 1960-1968

WALTER DEAN BURNHAM AND JOHN SPRAGUE

Washington University, St. Louis

I. THE NATURE OF THE PROBLEM

Of all the fields of political science where quantitative methods have been developed over the past generation, probably the one where scholarly understanding has been most enriched has been that of mass voting behavior. But while we know vastly more about this behavior on the individual and aggregate level than we did a quarter-century ago, there are still large territories on the map which are blank, or in which exploration has only very recently begun. There remain a number of doubtful areas in which issues of methodology and of substantive interpretation are still very much open to systematic inquiry.

One such area is that associated with the interrelation of socio-economic correlates of the vote.¹ That is, there is a real question as to whether such independent or predisposing variables should be conceptualized as making mutually independent or, alternatively, interdependent contributions to the prediction of voting patterns. The normal practice in research involving multiple correlation of aggregate voting behavior with a set of independent variables has been to assume implicitly that the relationship of these variables is additive (*i.e.*, non-interactive) and that the appropriate theoretical representation is of the general form $y = b + m_1x_1 + m_2x_2 \dots + m_nx_n$. Such an assumption seems plausible so far as individual voting for American major parties and their candidates is concerned. Thus, for example, the authors of the MIT 1960 simulation study found strong evidence that predispositional factors summate, *i.e.*, are indeed additive in character.²

If these assumptions and findings provided the best fit to this portion of reality under all or nearly all circumstances, we would be justified in leaving the problem of independent variable in-

teraction alone in this field, while remembering that interactive models might form a part of useful research strategies in other fields of political science.³ But a recent contribution by Glaucio Soares and Robert Hamblin has reopened the question, at least on the macro level of aggregate data.⁴ The authors argue that voting for radical parties (whether of left or right) is an act of positive or aggressive alienation; that such alienation is linked to feelings which are part of a class of involuntary responses; that it may well be that a (multiplicative) power function is the general form of relationship between the magnitude of stimuli and of non-voluntary responses; and that one might consequently expect to find, and does in fact find, that correlations based on an additive theoretical mode explain substantially less of the variance in the radical vote than do correlations based on a multiplicative theoretical model. Whatever the adequacy of the conceptual framework of the Hamblin and Soares article may appear to other researchers to be, there is no doubt that their procedures produced a spectacular increase in the power of a relatively few socio-economic variables to explain the variance in the 1951 vote for Allende in Chile.

Such results, standing as they do in sharp differentiation from many implicit assumption and some explicit findings regarding American and other voting behavior, present a challenge to further research in this area, and raise at once a number of questions to which answers seem rather urgently needed. Such questions include at least the following:

(1) Assuming the general validity—or at least plausibility—of the hypotheses developed in the Soares-Hamblin article as explanations of the greater power of the multiplicative model, it should follow that variation in voting for radical candidates or parties in other systems should be

¹ Multiple correlations of predisposing variables over time, of course, are nothing new in voting-behavior studies. See as the *locus classicus* Harold F. Gosnell, *Machine Politics: Chicago Model* (Chicago: University of Chicago Press, 1937); and also his *Grass-Roots Politics* (Washington: Public Affairs Press, 1942).

³ See Hayward Alker, Jr., *Mathematics and Politics* (New York: Macmillan, 1965), pp. 108-111 and Hubert M. Blalock, Jr., *Causal Inferences in Non-Experimental Research* (Chapel Hill: University of North Carolina Press, 1961), pp. 91-93.

⁴ Glaucio Soares and Robert Hamblin, "Socio-Economic Variables and Voting for the Radical Left: Chile, 1952," this REVIEW, LXI (1967), 1053-1065.

predicted more completely by multiplicative than by linearly additive models involving a set of socio-economic predictor variables. But it should also follow that variation in voting for non-radical candidates or parties should be predicted at least as well by additive models as by multiplicative. Is this in fact the correct pattern?

(2) On the other hand, it may be that when certain kinds of aggregate electoral and social data are employed, one can gain an across-the-board increase in explanatory power for all or most kinds of voting patterns (whether radical or not) simply by performing the appropriate transformations on variables to be included in multiple-correlation analyses. Such a result would be somewhat surprising, granted the MIT findings concerning American voting for major-party candidates at the level of the individual, but seems at least an *a priori* theoretical possibility. If converting to multiplicative models were a species of "black magic," the problem would lose most if not all of its theoretical interest, except as a possible empirical refutation of the explanatory hypotheses advanced by Soares and Hamblin. If, on the other hand, multiplicative formulation improves the power of socio-economic variables under some circumstances but not under others, then the use of a multiplicative model may have great potential as a tool of analytic discrimination in the study of aggregate voting behavior across time and space. Thus an additional question is simply, does conversion to multiplicative form tend to increase correlations across the board or not?

(3) What is the most appropriate way to conceptualize the difference between individual analysis based on the sample survey and aggregate-data analysis based upon official statistics from geographical units? This is one face of the units of analysis problem.

A word must be said about word usage. In this article we use the term interaction and interactive in a relatively loose way. The same can be said for our use of the terms additive, multiplicative, and linear. As a guide to the reader the term interactive can be thought of substantively as naming the situation where the effect of group membership on voting behavior is quite dependent for its magnitude or direction or both on the magnitude or properties of other groups in the same, context, *e.g.*, an intensification of blue collar tendencies to vote for Wallace as the density of non-whites increases. Technically we express this as a product among at least two variables measured on Pennsylvania counties and refer to this variously as a multiplicative or interactive model. Conversely, if the impact of a

social grouping on voting behavior is not affected by the presence, absence, or magnitude of other groups in the environment we refer to a non-interactive or additive environment. This is expressed technically by the sum of at least two variables measured on Pennsylvania counties and we refer (blithely and loosely) to an additive, linear, or non-multiplicative model.

The distinction in meaning between our use of additive and multiplicative is crucial for understanding the argument, for each term stands in turn as shorthand for a very different way of viewing the impact of social structure on individual behavior. The distinction between additive and multiplicative involves not only different technical representations and different substantive interpretations but ultimately must produce different theoretical commitments.

II. RESEARCH DESIGN

We decided to attempt a preliminary answer to the first two questions by applying a partial replication of the Soares-Hamblin technique to recent American electoral politics. If it is assumed initially that correlations based on a multiplicative model explain more than additive ones on a selective rather than an indiscriminate basis—as their argument demands—it is reasonable to suppose accordingly that the alternative relationships between additive and multiplicative correlations correspond roughly to the paradigm of Table 1.

TABLE 1. THREE RELATIONSHIPS BETWEEN ENVIRONMENT AND THEORETICAL REPRESENTATION OF ENVIRONMENT

"State of Political Nature" (Environment)	Representation	
	Additive Model	Multiplicative Model
Interactive	r^2	$< r^2$
Non-interactive	r^2	$> r^2$
Random	r^2	$= r^2$

That is to say—and again assuming initially what is assumed in the Soares-Hamblin article—it can be postulated that in cases where socio-economic factors aggregatively interact with each other (or are interdependent), correlations associated with multiplicative models will provide systematically greater explanations of variance than will those associated with additive ones, but that this will be true for such cases only.

But what kinds of contexts or "states of na-

ture" could be realistically described as "random"? Probably none in the real world; but such contexts might be artificially created. Here it is necessary to deal with the problem raised in question 3: what is measured by aggregate-data analysis and how does this relate to the behavioral measurements associated with survey-research work?

The answer to this question formulated by Erwin Scheuch is probably as good an approach as any to be found in the recent literature. His argument, essentially, is that research strategy is closely associated with the level of social analysis which the researcher chooses to study, and that as surveys provide the indispensable means for analyzing individual behavior in all of its ramifications, the analysis of aggregate data is an appropriate vehicle for the study of system properties and boundaries.⁵ Certainly some of the most exciting and illuminating work on electoral behavior now being done—for example by scholars such as Stein Rokkan and Henry Valen—involve a skillful blending of survey and aggregate analysis, with each mode being employed to shed light upon those ranges of political behavior to which it is appropriate.⁶

Our position is that measures on aggregate units are not only measures of summary individual behavior but also are measures of the context of individual behavior and that, in particular, these measures of context of environment are both useful and necessary for the complete analysis of electoral behavior. Furthermore, a choice of technical model will be especially crucial for assessing the effects of context. It has recently been argued that these environments not only are not "random" in the real world, but that in American politics they appear to have enormous importance as well as very great durability.⁷ Discussion of the environmental context in aggregate data can be found in the literature ranging back several decades. An outstanding

example was provided by Herbert Tingsten when, in a survey of 55 groups of Stockholm precincts, he found that socialist voting and turnout among working-class voters are related in a curvilinear fashion to the proportion of working-class people in the entire electorate, *i.e.*, that both socialist vote and turnout among working-class electors (especially working-class women) decline more rapidly than does the working-class percentage of the electorate.⁸ Similarly, the authors of *Voting*⁹ found that in Elmira there is a kind of *ceteris paribus* or "breakage" effect: all other things being more or less equal, the "Republican atmosphere" of the city will produce more Republican votes than could be explained on the basis of socio-economic characteristics alone. The argument presented by Soares and Hamblin is not fundamentally dissimilar from this: it is that certain kinds of socio-economic attributes tend aggregatively to be associated with each other, that the macro environment of Province X is correlated with the macro environments of all other provinces, even additively, in such a way that there is a strongly non-random relationship between the relative importance of the predictor variables and of the vote for the radical left. What they have provided, however, is a technique which may prove to be of considerable use in the analysis of aggregate voting behavior, and thus of the influence and nature of the environmental contexts surrounding that behavior.

The first step in the present research was to develop a series of socio-economic and political indicators and apply them to an American setting. For this purpose the 67 counties of the state of Pennsylvania were chosen as primary units of analysis. It should be noted here that Pennsylvania was not selected at random. Rather, this state was chosen as the focus of this study for several reasons. Of these, perhaps the most important was the fact that Pennsylvania's electoral politics is structured heavily around a set of polarizations classically associated with the New Deal and post-New Deal eras. At the least, these cleavages are organized around foreign-born/native-born, working-class/middle-class, center city/suburbs, so that, among the white population, the more Catholic an area's population, the larger the working-class component, the higher the proportion of the

labor force in manufacturing or mining, and the more urbanized, the higher the Democratic vote has tended to be since 1934. This structure of politics has—with the notable exception of Philadelphia city before 1949—been highly stable since the mid-1930's. If the existence of multiplicative relationships among predisposing variables were associated with the relative "modernity" of partisan alignment organized along class-ethnic lines, it should appear in major-party voting in Pennsylvania if anywhere in the United States. The evidential bases for the analyses we report come from three sources: (1) the 1960 census; (2) voter registration; and (3) election returns for 1960, 1964, and 1968.

A final caveat is in order concerning what we do *not* attempt in this paper. We are not attempting to find or present the "best" model for predicting variation in aggregate voting measures. Nor are we concerned with investigating the implications of the many different models we consider. Better predictions in the sense of tighter fit would undoubtedly be possible with so simple a variant as combining the additive and multiplicative models where the multiplicative contribution would enter as an index variable constructed by means of a separate regression. We are not attempting to settle the question of self-conscious model and theory construction but rather to raise it, and raise it in terms of the *form* of the model rather than in terms of the direction of causation. Thus, from the perspective of model construction and comparison in general, we are considering a very special case.

III. METHODOLOGICAL CONSIDERATIONS
